

**H.1 ROAD STORY AERIALS**

SCE engineers have performed a preliminary, detailed transmission engineering analysis of the proposed route for Segment 1 (Antelope-Pardee) which would involve replacement of the existing SCE Antelope Pole Switch 74 66 kV line over the majority of its length with a new 500 kV T/L between SCE's existing Antelope and Pardee 220kV substations.

Aerial photographs that show areas of planned ground disturbance/facility placement for the proposed route, including tower locations, access and spur roads, and on/off R-O-W pull sites are presented in this appendix. The aerial photographs are numbered in consecutive order (1 through 48) from the Pardee Substation to the Antelope Substation. The project details are subject to modification based on further environmental analysis, agency consultation, and final engineering.

Appendix H is presented as a separate volume (Volume 2) to this PEA.
