**RE: Sunrise Powerlink Transmission Project;
Air Quality Mitigation Program for Construction Air Emissions**

Dear Ms. Blanchard:

The California Public Utilities Commission (CPUC) issued a Certificate of Public Convenience and Necessity (CPCN) for the San Diego Gas & Electric Company (SDG&E) Sunrise Powerlink Transmission Project (Project) on December 18, 2008.¹ The Bureau of Land Management (BLM), to satisfy National Environmental Policy Act (NEPA) requirements, issued a Record of Decision (ROD) on January 20, 2009.² Both the CPUC and BLM adopted several air quality mitigation measures for the Project, which are listed in the ROD and the Project Final Environmental Impact Report / Environmental Impact Study (EIR/EIS).³ Accordingly, SDG&E respectfully requests CPUC review and acceptance of the enclosed proposed Air Quality Mitigation Program for Construction Air Emissions. As discussed below, the mitigation program reflects the construction air emission calculations for the approved route and proposes internal reductions, confirmed through monitoring, to satisfy mitigation measure AQ-1h, which is the primary focus of SDG&E's efforts to mitigate project criteria pollutant emissions.

¹ *Decision Granting a Certificate of Public Convenience and Necessity for the Sunrise Powerlink Transmission Project, available at http://docs.cpuc.ca.gov/PUBLISHED/AGENDA_DECISION/95357.htm#P2905_460034.* SDG&E anticipates commencing construction of the Project in 2010.

² *Record of Decision for the Sunrise Powerlink Transmission Project and Associated Amendment to the Eastern San Diego County Resource Management Plan, available at <http://www.blm.gov/pgdata/etc/medialib/blm/ca/pdf/elcentro/nepa/2007/eis.Par.9361.File.dat/ROD-SunrisePowerlinkJan2009.pdf>.*

³ *See San Diego Gas and Electric's Sunrise Powerlink Project Final Environmental Impact Report / Environmental Impact Statement and Draft Land Use Plan Amendment, Air Quality Section D11, available at <http://www.cpuc.ca.gov/environment/info/aspen/sunrise/feir/D11%20Air%20Quality.pdf>.*

Air Emissions Mitigation Requirements for the Approved Route

Mitigation measure AQ-1h requires 212 tons/year of NOx emission reductions for construction activities in San Diego County. For Imperial County, the measure requires 99 tons/year of oxides of nitrogen (NOx) emission reductions, and 276 tons/year of particulate matter less than 10 micron (PM10) emissions reductions. The emission reduction requirements were based upon projected NOx emissions exceeding a 100 ton/year significance threshold for federal conformity and projected PM10 emissions exceeding a 70 tons/year threshold in Imperial County. These construction air emission calculations are based on the Project's original Proposed Route.

The CPUC ultimately rejected the original Proposed Route through the Anza-Borrego Desert State Park and approved the Final Environmentally Superior Southern Route (FESSR), which runs through southern Imperial and San Diego Counties. The FESSR is shorter than the original Proposed Route. It proceeds west from the Imperial Valley area and cuts north after 36 miles, thus avoiding Anza-Borrego. The Final EIR/EIS included emissions estimates for project alternatives, including the FESSR. The proposed Air Quality Mitigation Program for Construction Air Emissions includes a summary of the criteria pollutant construction emissions for the original Proposed Route and the FESSR, as stated in the Final EIR/EIS. Total emissions of NOx, reactive organic gases (ROG), PM10, carbon monoxide (CO) and oxides of sulfur (SOx) are provided.

Updated to reflect the emissions as presented in the Final EIR/EIS for the FESSR, the AQ-1h requirement is now 243 tons/year of NOx emission reductions for construction activities in San Diego County. For construction activities in Imperial County, the revised requirement is 1 ton/year of NOx emission reductions and 105 tons/year of PM10 emissions reductions. These emission values do not include CPUC-approved mitigation measures, with the exception of fugitive dust control, and do not include final construction equipment usage projections for the FESSR.

Internal Reductions

Prior to the issuance of the ROD, both the Imperial County Air Pollution Control District (ICAPCD) (January 9, 2009⁴) and the San Diego Air Pollution Control District (SDAPCD) (January 12, 2009⁵) provided letters to BLM stating that, rather than securing permanent emission reduction credits, SDG&E may take appropriate actions to reduce short-term construction emissions through incentive programs supplemented with additional emissions reduction measures.

As demonstrated in SDG&E's Air Quality Mitigation Program for Construction Air Emissions (enclosed), mitigation measure AQ-1h will be satisfied primarily through internal reductions as confirmed by monitoring. SDG&E also is committed to providing incentive

⁴ Sunrise Powerlink Project Conformity Determination, Letter from Robert Poiriez, Imperial County Air Pollution Control District to Michael Pool, Bureau of Land Management, January 9, 2009.

⁵ Sunrise Powerlink Project Conformity Determination, Letter from Robert Kard, San Diego Air Pollution Control District to Michael Pool, Bureau of Land Management, January 12, 2009.

mitigation funding to the local air districts to further reduce criteria pollutant emissions from construction of the Project. Although not required to achieve the quantified emission reductions under AQ-1h, such mitigation funding will offer even greater assurance that the requirements of mitigation measure AQ-1h have been satisfied. SDG&E anticipates that the local air districts will use these funds to provide additional emission reductions through programs that may include, but are not limited to, the Carl Moyer Program, road paving, or other eligible programs as selected by the District.⁶

SDG&E appreciates your review of the enclosed Air Quality Mitigation Program for Construction Air Emissions for the Project. If you have any questions or comments, please do not hesitate to contact me.

Sincerely,

Alan Colton
Manager - Sunrise Powerlink Environmental Services

Enclosures.

cc: Bob Kard, San Diego County Air Pollution Control District
Brad Poiriez, Imperial County Air Pollution Control District

⁶ Please note that no credit has been taken for emission reductions achieved through the implementation of local air district programs. Mitigation measure AQ-1h can be independently satisfied through internal project mitigation as confirmed by monitoring.

Air Quality Mitigation Program for Construction Air Emissions

SDG&E's proposed air quality mitigation program for construction emissions will substantially reduce construction air emissions from the Sunrise Powerlink Transmission Project. Table 1 provides a summary of the criteria pollutant construction emissions for the original Proposed Route and the Final Environmentally Superior Southern Route (FESSR), as stated in the Final EIR/EIS. The estimated annual emissions after mitigation implementation are summarized in Table 2. Detailed air emission calculations are provided in Attachment 2.

Table 1. Final EIR/EIS Sunrise Powerlink Project Construction Air Emissions and Comparison to Significance Thresholds (tons/year)

San Diego County

Project Route	NOx	ROG	PM10	CO	SOx
Proposed Route	311.5	40.4	540.9	171.5	5.0
FESSR Alternative	342.9	44.4	595.5	188.8	5.5
<i>less threshold</i>	100	100	N/A	N/A	N/A
AQ-1h Reductions Required	243	--	--	--	--

Imperial County

Project Route	NOx	ROG	PM10	CO	SOx
Proposed Route	199.2	25.8	345.9	109.7	3.2
FESSR Alternative	100.8	13.1	175.1	55.5	1.6
<i>less threshold</i>	100	100	70	N/A	N/A
AQ-1h Reductions Required	1	--	105	--	--

These emission values do not include CPUC-approved mitigation measures, with the exception of fugitive dust control, and do not include final construction equipment usage projections for the FESSR.

In the final EIR/EIS, approximately 67% of projected NOx emissions originally estimated for the original Proposed Route were projected to be from off-road construction equipment, and about 33% from on-road vehicles. Approximately 97% of PM10 emissions were estimated to be from fugitive dust, and most of the remainder was estimated to be from off-road vehicle engines.

Table 2. Sunrise Powerlink Project Construction Air Emissions after Implementing Proposed Reductions (tons/year)

San Diego County

Project Route	NOx	ROG	PM10	CO	SOx
FESSR Alternative, EIR/EIS	342.9	44.4	595.5	188.8	5.5
less internal reductions	-253.1	-28.0	-439.7	-114.3	-3.7
<i>FESSR Alternative, mitigated</i>	<i>89.8</i>	<i>16.4</i>	<i>155.8</i>	<i>74.5</i>	<i>1.8</i>
% Reduction	74%	63%	74%	61%	67%
Additional reductions needed?	NO	--	--	--	--

Imperial County

Project Route	NOx	ROG	PM10	CO	SOx
FESSR Alternative, EIR/EIS	100.8	13.1	175.1	55.5	1.6
less internal reductions	-70.9	-7.6	-123.2	-30.7	-1.0
<i>FESSR Alternative, mitigated</i>	<i>29.9</i>	<i>5.5</i>	<i>51.9</i>	<i>24.8</i>	<i>0.6</i>
% Reduction	70%	58%	70%	55%	63%
Additional reductions needed?	NO	NO	--	--	--

As shown in Table 2, the calculated reductions will satisfy (and exceed) the requirements of updated mitigation measure AQ-1h. Based on the emissions values previously calculated for the original Proposed Route, mitigation measures generally are expected to reduce construction-related emissions by approximately 60-75% in San Diego County and by approximately 55-70% in Imperial County.

In order to satisfy mitigation measure AQ-1h, SDG&E proposes to implement the following procedures:

1. ***Use of Tier 3 Off-Road Equipment.*** SDG&E proposes to provide additional emissions reductions by requiring construction contractors to use Tier 3 diesel off-road equipment rather than Tier 2 equipment as proposed in mitigation measure AQ-1b. This will reduce emissions of NOx, CO and PM10.

Mitigation measure AQ-1b requires the use of low-emission diesel-fueled off-road construction equipment rated greater than 50 hp to meet, at a minimum, Tier 2 California Emission Standards specified in Code of Regulations Title 13, Section 2423(b)(1). Portable generators not in the statewide Portable Equipment Registration Program also must meet the requirement. The Tier 2 NOx + NMHC emission factors are 5.6 g/hp-hr for equipment less than 100 hp, 4.9 g/hp-hr for equipment 100 hp to less than 300 hp, and 4.8 g/hp-hr for larger equipment. NMHC stands for non-methane hydrocarbons, accounting for typically about 5% of diesel off-road engine NOx + NMHC emissions. Therefore, NOx emission calculations are conservative.

The Tier 3 NOx + NMHC emission factors are 3.5 g/hp-hr for equipment 75 hp to less than 100 hp, and 3.0 g/hp-hr for larger equipment. For a 250 hp engine, use of Tier 3

equipment represents about a 39% reduction in NOx emissions. Emissions were calculated for specific equipment types using typical load factors published at www.arb.ca.gov/msei/onroad/downloads/pubs/mo9932.zip.

If Tier 3 equipment cannot be provided by contractors for any scheduled equipment, the contractor will be required to note this situation. If no Tier 3 equipment is available, then the current requirements of mitigation measure AQ-1b will be followed. Contractors will be required to log equipment engine model, hp rating, EPA family number, and approximate daily and hourly usage.

SDG&E conservatively estimates that at least 60% of off-road equipment will meet Tier 3 standards. Tier 3 standards for engines greater than 175 hp became effective in 2006, four years before construction is scheduled to commence.

2. ***Reduce Use of Off-Road Equipment.*** SDG&E has developed a worst-case schedule for FESSR off-road equipment usage that is substantially reduced from the emission calculation assumptions used in the Final EIR/EIS. In the Final EIR/EIS, emission calculations were completed assuming most off-road construction equipment will operate for 12 hours per day and 6 days per week. For the original Proposed Route, off-road, diesel-fueled equipment was projected to be used for about 1,470,000 total hours during construction.

SDG&E's updated worst-case assumptions for off-road diesel-fueled equipment usage (revised to reflect the approved FESSR) includes reducing operating time for equipment to approximately eight hours per day and using equipment only as needed during each construction phase. Some equipment will operate up to ten hours per day as needed, but many equipment pieces will operate only two to six hours per day. The expected hours of off-road equipment operation will be reduced to approximately 316,000 total hours. This technique will result in an estimated 79% reduction in total off-road equipment usage and associated diesel fuel combustion.

SDG&E plans to use helicopters to ferry tower sections to final assembly areas, to install transmission lines, and to shuttle workers to more remote tower assembly locations. This approach is considered to be a non-conventional construction approach. While the non-conventional approach will increase the use of helicopters (and helicopter emissions) from that stated in the Final EIR/EIS, the use of off-road equipment is expected to be further reduced. The mix of off-road equipment and helicopter usage will not be finalized until contractors are selected. Therefore, the updated construction emission calculations in Attachment 2 include a worst-case estimate of conventional off-road equipment usage plus non-conventional helicopter usage. If needed to claim additional internal reductions, further refinement will be made to reflect the estimated use of off-road construction equipment.

Actual operation of off-road equipment will also be reduced by implementing mitigation measure AQ-APM-5 to minimize equipment idling.

3. ***Reduce Construction Worker Trips.*** SDG&E has developed a worker and crew schedule that reduces the number of workers from the schedule assumed for the original Proposed Route in the Final EIR/EIS. In the Final EIR/EIS, 800 workers per day, for 22 days per month, were assumed to be at the site continuously over the first 12 months, with 580 workers per day, six days per week, over the last 10 months. Combined with an assumption of 60 miles round trip (15% on unpaved roads) traveled per day and a 1.3 rideshare factor, about 15,600,000 worker commute vehicle miles traveled (VMT) in light-duty vehicles were estimated. An additional 7,600,000 worker VMT were estimated for crew and QA/QC mobilization in light-duty vehicles. The total worker VMT in the Final EIR/EIS was estimated at about 23,200,000 VMT.

SDG&E proposes a schedule that reduces the number of workers to 450 per day for the first 12 months and 375 per day for the last 10 months, with a total estimated 9,300,000 VMT for worker commutes. The work schedule will be maintained at 22 days per month. The estimated crew and QA/QC mobilization worker trips will be reduced substantially to about 1,400,000 VMT, for total worker VMT of about 10,700,000. This results in a reduction of total VMT and emissions of NOx, ROG, PM10, CO, and SOx from light-duty vehicle fuel combustion of about 54% from emissions stated in the Final EIR/EIS. Because fugitive PM10 emissions depend upon worker VMT, these emissions will be substantially reduced. The Final EIR/EIS assumptions of 60 miles per round-trip for VMT per worker per day, the 1.3 rideshare factor, and 15% travel on unpaved roads have been retained in updated emission calculations.

Worker trips will also be reduced by implementing mitigation measure AQ-APM-4, which encourages carpooling, to an expected rideshare factor greater than 1.3. As part of the construction scheduling process, SDG&E is developing a worker carpool program.

Note that the 15% of travel on unpaved roads (9 miles/day) is a highly conservative assumption for this Project. Workers will drive to construction areas on paved roads. They may park in some unpaved areas but will drive very little on unpaved roads. During construction hours, these workers will transfer on-site to work with off-road construction equipment or be ferried to worksites in helicopters. The total length of access roads for the FESSR will be minimized due to the heavier planned usage of helicopters for tower and line installation and shuttling of workers.

4. ***Reduce On-Road Medium-Duty and Heavy-Duty Vehicle Delivery Trips.*** SDG&E proposes to reduce deliveries to only those needed to construct the Project during each phase. Deliveries of steel and parts for tower and transmission line construction are expected to come from the Los Angeles area via Interstates 5, 15 and 8, and State Route 78, or from the San Diego County area via Interstate 8. Deliveries of material removal will be to locations near the Sunrise Powerlink construction areas within San Diego County or Imperial County. The estimated VMT for medium-duty trucks will be 175,800, and about 1,900,000 for heavy-duty trucks. For heavy-duty vehicles, this results in a reduction of in VMT of approximately 80%, from about 9,300,000 estimated in the Final EIR/EIS for the original Proposed Route.

In the Final EIR/EIS, 60 miles round-trip per heavy-duty vehicle was assumed. For deliveries from the Los Angeles area, the assumption has been updated to 150 miles round-trip per vehicle within San Diego County. For all other deliveries, the 60 mile round-trip assumption was retained.

The Final EIR/EIS contained a calculation error for use of heavy-duty vehicles for commercial deliveries, material removal, and equipment, fuel, and water deliveries. For the original Proposed Route, about 16,400,000 VMT for heavy-duty trucks were estimated in the Final EIR/EIS. For fuel transportation and water deliveries, Total VMT was calculated as total days x VMT/day. However, an additional incorrect factor of 22 was included in the calculation. This erroneous factor was carried down from another formula (for material delivery and equipment delivery) in the spreadsheet where Total VMT = VMT/day x 22 days/mo x 22 months.

After correcting the error (removing the factor of 22 for fuel and water deliveries, the revised heavy-duty VMT is approximately 9,300,000. A notable assumption is that 246 material and waste removal deliveries were assumed to occur for heavy-duty vehicles each day for 22 months. In fact, average daily deliveries will be much lower. Emissions are driven by the heavy-duty vehicles. The correction of this error alone leads to a 43% reduction in NOx, ROG, CO, PM10, and SOx emissions from heavy-duty on-road vehicles.

5. ***Implementation of Dust Control Measures.*** Mitigation measures AQ-1a, AQ-APM-2, and AQ-APM-3 will be implemented in San Diego County to minimize dust formation and fugitive PM10 emissions. For example, AQ-1a (a) requires paving, watering, or applying non-toxic stabilizers on all unpaved access roads, parking areas, and staging areas, if visible dust is observed. SDG&E plans to implement watering three times per day. The original EIR/EIS assumption of 75% control from watering and other assumptions were retained for fugitive PM10 calculations without change.
6. ***Mitigation Incentive Funding for the Sunrise Powerlink Project.*** SDG&E has committed to providing incentive funding to the SDAPCD and ICAPCD to be used for air quality mitigation programs. The funding level offered to SDAPCD is \$536,000. The funding level offered to ICAPCD is \$417,064. This funding will be paid to the air districts prior to completing construction. SDG&E anticipates that this funding payment will be used by the air districts to provide additional emission reductions through programs that may include, but are not limited to, the Carl Moyer Program, Vehicle Registration Fund, Lower Emission School Bus Fund, road paving, or other eligible programs. SDG&E understands that payment of incentive funding to the air districts is subject to approval by the respective Air Pollution Control Boards.

Sufficient internal reductions are available to reduce Sunrise Powerlink construction emissions to satisfy mitigation measure AQ-1h. Therefore, this mitigation funding is considered to be additional to current mitigation needs but will provide even greater assurance that mitigation measure AQ-1h will be met.

Other Air Emission Calculation Refinements

SDG&E included several technical refinements to the construction emission calculations provided in the Final EIR/EIS. The following refinements are not related to the emission reduction plans already discussed:

1. ***Emissions Apportionment by County.*** In the Final EIR/EIS, emissions were apportioned to each county based upon the linear distance of the Sunrise Powerlink transmission line. The linear distance for the original Proposed Route was about 150 miles. Approximately 61% of project emissions were apportioned to San Diego County and 39% to Imperial County. The linear distance for the FESSR is 118.1 miles. Approximately 75% of the transmission line will be in San Diego County and 25% in Imperial County. These percentages were used to update the emissions apportionment between counties.
2. ***Non-Conventional Use of Helicopters.*** SDG&E plans to follow a non-conventional transmission line construction approach that includes lifting tower sections from staging areas to installation locations and shuttling workers. The final EIR/EIS did not account for this increased use of several types of helicopters (i.e., light, medium, heavy lift) and higher associated emissions. SDG&E used the Emissions and Dispersion Modeling System (EDMS) to develop helicopter emission factors for various operating modes and helicopter classes. SDG&E developed detailed Project helicopter operating mode information that was used in conjunction with emission factors from EDMS.
3. ***Updated Off-Road Emission Factors to EPA and 2010 OFF-ROAD Model Values.*** Construction emissions calculations included Tier 3 or Tier 2 NOx + NMHC emission factors, as described previously in this letter. Emission factors for ROG and SOx were updated from 2008 to 2010 OFFROAD model mix of emission factors published on the South Coast Air Quality Management District (SCAQMD) website, available at <http://aqmd.gov/ceqa/handbook/off-road/off-road.html>.
4. ***Correction for Double-Counting of Load Factors for Off-Road Equipment.*** The Final EIR/EIS contained an error that double-counted off-road equipment load factors. The SCAQMD hourly emission factors that were used already have equipment load factors built in. However, an additional load factor was incorrectly applied, which underestimated emissions. This error has been corrected.
5. ***Updated On-road Vehicle Emission Factors for 2010.*** On-road vehicle emission factors were updated from 2008 to 2010 EMFAC v2.3 values provided on the SCAQMD website, available at <http://aqmd.gov/ceqa/handbook/on-road/on-road.html>.

Emission calculation methods and assumptions do not otherwise differ from those provided in the Final EIR/EIS.

Attachment 1
CPUC Air Quality Mitigation Measures for the Sunrise Powerlink Project

Mitigation measures pertinent to construction criteria pollutant emissions include:

1. Control emissions of dust and particulate matter (AQ-1a, AQ-APM-1, AQ-APM-2, and AQ-APM-3);
2. Use low-emission construction equipment (AQ-1b);
3. Obtain NOx emission offsets (AQ-1h);
4. Encourage carpooling (AQ-APM-4); and
5. Minimize vehicle idling (AQ-APM-5).

Accordingly, SDG&E has committed to implementing the following CPUC-approved quality mitigation measures.

AQ-1a. **Suppress dust at all work or staging areas and on public roads.** SDG&E shall:
(a) pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas if construction activity causes persistent visible emissions of fugitive dust beyond the work area; (b) pre-water sites for 48 hours in advance of clearing; (c) reduce the amount of disturbed area where possible; (d) all dirt stock-pile areas should be sprayed daily as needed; (e) cover loads in haul trucks or maintain at least six inches of free-board when traveling on public roads; (f) pre-moisten, prior to transport, import and export dirt, sand, or loose materials; (g) sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets or wash trucks and equipment before entering public streets; (h) plant vegetative ground cover in disturbed areas as soon as possible following construction; (i) apply chemical soil stabilizers or apply water to form and maintain a crust on inactive construction areas (disturbed lands that are unused for four consecutive days); and (j) prepare and file 30 days in advance of construction with the ICAPCD, SDAPCD, BLM, and CPUC a Dust Control Plan that describes how these measures would be implemented and monitored at all locations of the project. The Dust Control Plan shall identify nearby sensitive receptors, such as land uses that include children, the elderly, the acutely ill and the chronically ill, and specify the means of minimizing impacts to these populations (for example, by locating equipment and staging areas away from sensitive receptors).

AQ-1b. **Use low-emission construction equipment.** SDG&E shall maintain construction equipment per manufacturing specifications and use low-emission equipment described here. All off-road and portable construction diesel engines not registered under the CARB Statewide Portable Equipment Registration Program, which have a rating of 50 horsepower (hp) or more, shall meet, at a minimum, the Tier 2 California Emission Standards for Off-Road Compression-Ignition Engines as specified in California Code of Regulations, Title 13, Sec. 2423(b)(1) unless

that engine is not available for a particular item of equipment. In the event a Tier 2 engine is not available for any off-road engine larger than 100 hp, that engine shall be equipped with a Tier 1 engine. If any engine larger than 100 hp does not meet Tier 1 standards, that engine shall be equipped with a catalyzed diesel particulate filter (soot filter), unless the engine manufacturer indicates that the use of such devices is not practical for that particular engine type. SDG&E shall substitute small electric-powered equipment for diesel- and gasoline-powered construction equipment where feasible.

- AQ-1h.** **Obtain NOx and particulate matter emission offsets.** SDG&E shall obtain and hold for the duration of construction NOx emission reduction credits or fund incentive programs approved by ICAPCD and SDAPCD at sufficient levels to offset the construction emissions of NOx that exceed the ozone nonattainment area federal General Conformity Rule applicability threshold. SDG&E shall secure 99 tons per year of NOx reductions and 276 tons per year of particulate matter reductions in Imperial County, and SDG&E shall secure 212 tons per year of NOx reductions in San Diego County to satisfy this requirement. The emission reduction credits or incentive program shall comply with ICAPCD and SDAPCD rules and regulations, and the credits or reductions shall be obtained by SDG&E prior to commencing construction.
- AQ-APM-2.** Prohibit construction grading on days when the wind gusts exceed 25 mph to the extent feasible to control fugitive dust.
1. All trucks hauling soil and other loose material will be covered or maintain at least two feet of freeboard.
 2. Snow fence-type windbreaks will be erected in areas identified as needed by SDG&E.
 3. Vehicle speeds will be limited to 15 mph on unpaved (no gravel or similar surfacing material) roads.
 4. Unpaved roads will be treated by watering as necessary.
 5. Soil stabilizers will be applied to inactive construction areas on an as-needed basis.
 6. Exposed stockpiles of soil and other excavated materials will be contained within perimeter silt fencing, watered or treated with soil binders, as necessary.
- AQ-APM-3.** To minimize mud and dust from being transported onto paved roadway surfaces, pave, gravel, use rattle plates or apply chemical stabilization at sufficient concentration and frequency to maintain a stabilized surface starting from the point of intersection with the public paved surface. SDG&E will implement this measure where applicable and not conflicting with other requirements.

- AQ-APM-4.** If suitable park-and-ride facilities are available in the project vicinity, construction workers will be encouraged to carpool to the job site to the extent feasible. The ability to develop an effective carpool program for the Proposed Project would depend upon the proximity of carpool facilities to the job site, the geographical commute departure points of construction workers, and the extent to which carpooling would not adversely affect worker show-up time and the project's construction schedule.
- AQ-APM-5.** To the extent feasible, unnecessary construction vehicle and idling time will be minimized. The ability to limit construction vehicle idling time is dependent upon the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel-powered vehicles, have extended warm-up times following start-up that limit their availability for use following start-up. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The project will apply a "common sense" approach to vehicle use; if a vehicle is not required for use immediately or continuously for construction activities, its engine will be shut off. Construction foremen will include briefings to crews on vehicle use as a part of pre-construction conferences. Those briefings will include discussion of a "common sense" to vehicle use.

Mitigation Monitoring and Verification

Mitigation monitoring and verification procedures for each the CPUC-required measures listed above, including mitigation measure AQ-1h are as follows:

< To be completed for selected measures: 1. Monitoring procedure, 2. Verification procedure>.

1. Require contractors to use Tier 3 off-road equipment unless unavailable.
2. Require contractors to minimize idling.
3. For each piece of equipment used, contractors maintain a log of equipment type, engine EPA family #, engine hp rating, fuel type and usage hours (includes ground equipment and helicopters).
4. Contractor checks engine family number for CARB certification prior to usage, State reasons on log if Tier 3 off-road equipment is unavailable.
5. SDG&E Compliance Manager verifies engine certification using EPA family #.
6. Off-road equipment use and certification reports provided to CPUC.
7. Log on-road deliveries, vehicle type and estimated vehicle miles traveled.

Air Emissions Calculations Summary

FESSR Construction Phase Emissions, Sunrise Powerlink

Assumed Tier 3 offroad engines percentage mix:

60%

Offroad Tiers 2-3 emission factors (EFs) are applied to NOx, PM, and CO. Load factors (LFs) are used in conjunction with Tiers 2-3 EFs.

2010 SCAB EFs (OFFROAD2007 model) are applied to CO2, ROG, SOX. LFs already incorporated in OFFROAD model.

Onroad model (EMFAC) assumes 1990-2011 composite fleet across light, medium, and heavy duty vehicle classes.

Helicopter emissions are calculated using EDMS 5.1 and CCAR recommended emission factors.

Onroad/offroad equipment mix and schedules, including helicopter classes and usage, as provided by construction contractor (Sargent & Lundy LLC)

Annual Emissions of Proposed Project		NOX (tpy)	ROG (tpy)	PM10 (tpy)	CO (tpy)	SOX (tpy)	CO2 (tpy)
Imperial County	Offroad Vehicles and Equipment	23.1	3.3	1.0	16.5	0.0	3,584.8
	Onroad Vehicles	4.2	0.7	0.2	5.7	0.0	1,148.7
	Helicopters	2.6	1.5	0.8	2.6	0.5	1,320.5
	Fugitive Dust	---	---	49.9	---	---	---
	Total for Imperial County *	29.9	5.5	51.9	24.8	0.6	6,054.0
San Diego County	Offroad Vehicles and Equipment	69.4	9.8	3.0	49.5	0.1	10,754.5
	Onroad Vehicles	12.6	2.0	0.6	17.2	0.0	3,446.0
	Helicopters	7.8	4.5	2.4	7.8	1.6	3,961.6
	Fugitive Dust	---	---	149.8	---	---	---
	Total for San Diego County **	89.8	16.4	155.8	74.5	1.8	18,162.1

* Basis: 0.25 of Total Proposed Project divided over two years.

** Basis: 0.75 of Total Proposed Project divided over two years.

Overall Emissions of FESSR, Sunrise Powerlink	NOX (ton)	ROG (ton)	PM10 (ton)	CO (ton)	SOX (ton)	CO2 (ton)
Offroad Vehicles and Equipment with Tier 3	185.0	26.2	8.1	132.0	0.3	28,678.6
Onroad Vehicles	33.6	5.3	1.6	45.8	0.1	9,189.4
Helicopters	20.8	12.1	6.4	20.8	4.3	10564.2
Fugitive Dust			399.4			
Total Emissions for Project Duration	239.4	43.6	415.5	198.6	4.7	48,432.2

Offroad Emissions Calculation - Using SCAB Emission Factors

2010 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.

Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.

Load factors are used in conjunction with Tier 2 and 3 EFs.

Offroad Emissions Calculation - Using SCAB Emission Factors

2010 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.

Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.

Load factors are used in conjunction with Tier 2 and 3 EFs.

Offroad Emissions Calculation - Using SCAB Emission Factors

2010 SCAB emission factors (EFs) corresponding to OFFROAD2007 model are applied to CO2, ROG, and SOX.

Tier 2 and 3 EFs are applied to NOx, PM, and CO. Calculation details are provided in *Offroad Tier 2* and *Offroad Tier 3* worksheets.

Load factors are used in conjunction with Tier 2 and 3 EFs.

Offroad Emissions Calculations - Using Tier 2 Emission Factors

Tier 2 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 2 EFs.
2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in *Offroad SCAB* worksheet.

Offroad Emissions Calculations - Using Tier 2 Emission Factors

Tier 2 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 2 EFs.
2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in *Offroad SCAB* worksheet.

Offroad Emissions Calculations - Using Tier 2 Emission Factors

Tier 2 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 2 EFs. 2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in *Offroad SCAB* worksheet.

Offroad Emissions Calculations - Using Tier 3 Emission Factors

Tier 3 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 3 EFs.
2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in Offroad SCAB worksheet.

Offroad Emissions Calculations - Using Tier 3 Emission Factors

Tier 3 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 3 EFs.
2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in Offroad SCAB worksheet.

Offroad Emissions Calculations - Using Tier 3 Emission Factors

Tier 3 emission factors (EFs) are applied to NOx, PM, and CO. Load Factors (LFs) are used in conjunction with Tier 3 EFs.
2010 SCAB EFs (OFFROAD2007) are applied to CO2, ROG, and SOX. Calculation detail is provided in Offroad SCAB worksheet.

a) The PM standard for hand-start, air cooled, direct injection engines below 11 hp may be delayed until 2010 and be set at 0.45 g/bhp-hr.

b) Standards given are NMHC/NOx/CO/PM in g/bhp-hr.

c) Engine families in this power category may alternately meet Tier 3 PM standards (0.30 g/bhp-hr) from 2008-2011 in exchange for introducing final PM standards in 2012.

d) The implementation schedule shown is the three-year alternate NOx approach. Other schedules are available.

e) Certain manufacturers have agreed to comply with these standards by 2005.

Helicopter Emissions Calculation

Helicopter flight hours based on estimates from Sargent & Lundy LLC construction contractor:

1 structure/day

- heavy lift helicopter **2** hours per structure
- medium lift helicopter **4** hours per structure
- light lift helicopter **10** hours per structure

Helicopter Emission Factors

CO, VOC, NOx, and SOx helicopter emissions are calculated using EDMS 5.1 emission factors

PM helicopter emissions are calculated using factors provided in *Volume 4, Procedures for Emissions Inventory Preparation, EPA420R-92-009*.

CO₂ helicopter emissions are calculated using CCAR recommended factor 9.57 kg CO₂/gallon jet fuel

Flight cycles based on estimates from Sargent & Lundy and calculated to: 16.43 minutes for heavy lift, 16.43 minutes for medium lift, and 9.92 minutes for light lift helicopter.

Helicopter operating modes, as percentages of total engine run time, are estimated as follows

Taxi Out	10%
Takeoff	5%
Climbout	10%
Approach/Cruising	65%
Taxi In	10%

Density Jet A .8 kg/L
CO₂ emission factor 9.57 kg CO₂/gal jet fuel 3156.33 g/kg jet fuel @ 15C

<--> Title : San Diego
Version : Emfac2007 V2.3 Nov 1 2006
Run Date : 2009/03/23 17:00:09
Scen Year: 2011 -- All model years in the range 1990 to 2011 selected
Season : Annual
Area : San Diego Air Basin Average
I/M Stat : Enhanced Interim (2005) -- Using I/M schedule for area 38 San Diego (SD)
Emissions: Tons Per Day

Fugitive Dust Generating Activity Estimates

Proposed Activity Sites and Areas						
(Activity Areas)	Imperial Valley (acres)	Anza Borrego (acres)	Central (acres)	Inland Valley (acres)	Coastal (acres)	Sycamore-Elliott (acres)
Source: Project Description Table B-3, B-7, B-9.						
Access Roads						
Proposed Transmission Line Access Roads	119.7	19.4	182.3	24.7	1.2	0.0
Existing Transmission Line Access Roads	74.1	76.2	31.0	133.0	142.9	29.8
Central East Substation						
Proposed Central East Substation				106.0		
Construction Staging Areas and Fly Yards						
Drew Road at I-8 in Imperial Valley	5.0					
Westmorland near the IID 161 kV line and SR-86	5.0					
Ocotillo Air Strip, north of SR-78 in Ocotillo Wells	15.0					
SDG&E property adjacent to Borrego Substation		5.0				
Central East Substation (batch plant and fly yard)			15.0			
Warners Substation at intersection of SR-79 and S-2			4.0			
SDG&E property at existing Santa Ysabel Substation			4.0			
Gunn Stage Road at entrance to Mount Gower Preserve				2.0		
SDG&E parcel at Ashley Road and Creelman Lane				5.0		
East of existing Chicarita Substation					5.0	
Total Activity Sites and Areas (acres)	218.8	100.6	342.3	164.7	149.1	29.8
Duration of Activity (months)	18	18	22	22	12	2
Total Acre-Months	3,938	1,811	7,531	3,623	1,789	60
Assume: Sycamore Canyon-Elliott activity occurs over existing 30 ft access road over 8.2 miles = 29.8 acres.						

Proposed Access Roads

Fugitive Dust Emissions by Activity

Source: Emission factors from USEPA AP-42 and South Coast Air Quality Management District, where noted.

VMT has been updated according to schedule from Sargent & Lundy.

Proposed Access Road and Trench Restoration grading mileage has been updated to reflect length of project

Activity, Bulldozing of Overburden, and Excavation information has not been changed.
