**AMENDED APPLICATION OF SOUTHERN CALIFORNIA EDISON COMPANY  
(U 338-E) FOR A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY TO  
CONSTRUCT THE COOLWATER-LUGO TRANSMISSION PROJECT**

**I.  
INTRODUCTION**

On August 28, 2013, Southern California Edison Company (SCE) filed Application 13-08-023 (Application) for a Certificate of Public Convenience and Necessity (CPCN) for the Coolwater-Lugo Transmission Project (Coolwater-Lugo). SCE also concurrently filed its Proponent’s Environmental Assessment (PEA) for Coolwater-Lugo with the Application.

On December 17, 2013, a Prehearing Conference (PHC) was held for Coolwater-Lugo and several clarifying issues regarding the Application were explored. On March 14, 2014, the Commission issued a Joint Assigned Commissioner and Administrative Law Judge’s Ruling Requiring Amended Application, Resolving Outstanding Protest Requests and Motions to Strike (Ruling).

Per the Ruling, SCE is required to amend its Application and PEA with additional information requested in the Ruling. (Ruling at 3-7) This Amended Application includes the following:

- Responses to questions 1-9 presented in the Ruling, which include several documents, such as:

- Amended PEA Chapters:
  - Executive Summary and Chapter 1 Purpose and Need<sup>1</sup>
  - Chapter 3 Project Description<sup>2</sup>
- Amended Appendix H Estimated Project Costs;
- Requested reports and studies;
- Amended proceeding schedule;
- Amended Appendix C Notice of Application, <sup>3</sup> which includes an amended 300-foot list, and agency and interested party lists; and
- Amended Appendix E Financial Statement.

Sections of the August 28, 2013 Application that remain unchanged by this Amended Application are noted as remaining unchanged. Modifications to Application sections are noted with underlined text for additions and with strikethrough for text that is deleted. Sections II and III provide new information, pursuant to the ACR.

## II.

### **PROJECT SCOPE AND EXPLANATION OF MINIMUM, INITIAL AND FULL BUILDOUT AND SCOPE OF SCE'S CPCN APPLICATION**

In its Application, SCE included the following list of major components of Coolwater-Lugo. The complete descriptions are provided in Chapter 3 of the Amended PEA:

#### Substations

- Reconfigure Coolwater 220 kV Switchyard
- Terminate new Coolwater-Desert View 220 kV Transmission Line at the Coolwater and Desert View 220 kV buses

---

<sup>1</sup> Provided as Appendix J to the Amended Application and filed separately as an archival DVD.

<sup>2</sup> Provided in Appendix L to the Amended Application and filed separately as an archival DVD.

<sup>3</sup> CPUC Rule 2.6 states “unless otherwise provided by rule, decision, or General Order, a protest or response must be filed within 30 days of the date the notice of the filing of the application first appears in the Daily Calendar.” GO 131D provides under section XII that protests are due 30 days after the notice was mailed or published. Since SCE will mail the notices on April 25, 2014, SCE calculates that protests will be due May 27, 2014.

- Install new relay buildings and necessary equipment to support the SPS at Coolwater 220 kV Switchyard
- ~~Expand the Lugo 500 kV Switchrack to the south five positions~~
- ~~Relocate two existing 500 kV transmission line terminations at Lugo Substation~~
- Terminate new Desert View-Lugo 500 kV construction, initially energized at 220kV, Transmission Line at the Desert View and Lugo 220 kV buses
- ~~Install one additional 500/220 kV transformer bank at Lugo Substation~~
- ~~Construct new relay building and install bank protection relays at Lugo Substation~~
- Install new protection, control, and SPS at Lugo Substation
- License proposed Desert View 500/220/115/12 kV Substation and initially construct the facilities necessary to loop the Coolwater-Lugo 220 kV Transmission Line and consolidate the Lugo-Pisgah No.1 & No.2 220 kV Transmission Lines into Desert View Substation as needed including new protection, control, and SPS at Desert View Substation.

#### Transmission and Telecommunication

- Remove approximately 29.1 miles of the existing Lugo-Pisgah No.1 220 kV Transmission Line from Lugo Substation northeast to approximately the intersection of Haynes Road and State Route 247 (“SR-247”)
- Remove approximately 16.0 miles of the existing Lugo-Pisgah No.2 220 kV Transmission Line from Lugo Substation northeast to proposed Desert View Substation and terminate the remaining portion of this line into the proposed Desert View Substation
- Construct 16.6 miles of 500 kV single-circuit transmission line (2B-2156 ACSR conductor, replacing the two existing Lugo-Pisgah No. 1 and No.2 220 kV Transmission Lines, initially energized at 220 kV) from Lugo Substation to the proposed Desert View Substation and 13.6 miles of 220 kV double-circuit transmission line in existing ROW from proposed Desert View Substation to approximately the intersection of Haynes Road and SR-247
- Construct approximately 34.0 miles of 220 kV double-circuit transmission line from Coolwater 220 kV Switchyard south to the existing Lugo-Pisgah transmission corridor, located approximately near the intersection of Haynes Road and SR-247
- Install a new 150-foot tall microwave tower and foundation at the existing Coolwater 220 kV Switchyard
- Install lightwave transponder equipment or optical amplifier and channel bank equipment at Coolwater Switchyard, Lugo Substation, and the proposed Desert View Substation
- Install approximately 11.0 miles of Fiber-Optic Cable from existing Apple Valley Substation to the proposed Desert View Substation. Install approximately 29.0 miles of Fiber-Optic Cable from existing Pisgah Substation near Newberry Springs to the existing Gale Substation near Daggett.

In Appendix H, Estimated Project Costs, provided in support of its Application, SCE included three buildout options for the Coolwater-Lugo Project: the Minimum, Initial, and Full Buildout (Buildout Options). The PEA, however, described only the Initial and Full Buildouts. The Proposed Project description in the Application and PEA correlates to the Initial Buildout. To address the confusion this may have caused, SCE offers the following explanation of the Buildout Options and clarifies the scope of SCE's CPCN Application with this Amended Application and Amended PEA, which includes the following amended Chapters: Executive Summary, Chapter 1 Purpose and Need, and Chapter 3 Project Description.

All three Buildout Options are comprised of the same basic components. Each has the same line route, each segment of the project utilizes the same types of structures, and each has Desert View Substation as a component. The primary differences between the Buildout Options are the level of stringing on the structures, the level of buildout of the Desert View Substation, and the associated costs. All Buildout Options assume that SCE's proposed route, rather than an alternative, is selected.

#### Minimum Buildout

The Minimum Buildout Option is comprised of double circuit 220 kV structures along Segments 1, 2, 3, and 12 of the Project, basically, from Coolwater Switchyard to the existing Lugo-Pisgah No.1 220 kV transmission corridor where Segment 3 meets Segment 5. (Appendix I.) For the Minimum Buildout, only one side of the double circuit 220 kV structures would be strung to support an initial single circuit. Stringing the second side of the double-circuit 220 kV structures would occur in the future when the need for a second circuit arises. The Minimum Buildout also includes siting the Desert View Substation. This would include acquiring the approximate 160 acre parcel but only grading 13.5 acres to support an initial 220 kV switchrack, building the initial four position switchrack, a Mechanical Electrical Equipment Room (MEER), and station light and power. The Minimum Buildout also includes Segments 5 and 7. Segment 5 is comprised of 220 kV double circuit structures, with both sides strung. Segment 7 is comprised of 500 kV structures with 2B-2156 ACSR conductor, initially energized to 220 kV, replacing the

two existing Lugo-Pisgah No. 1 and No. 2 220 kV Transmission Lines. Segments 5 and 7 are the same for all Buildout Options.

In its Application, SCE also originally included a third AA bank and associated upgrades at Lugo Substation in this configuration. SCE has removed the AA bank from the Minimum Buildout and its associated costs of \$81 million. As such, the costs of the Minimum Buildout reflect reductions from stringing only one side of the double circuit 220 kV structures and removing the AA bank. The cost of the Minimum Buildout in Appendix H of the Application was \$559 million in Direct Expenditures in 2013 constant dollars. With the cost reductions described above, the amended cost estimate for the Minimum Buildout is \$460 million in Direct Expenditures in 2013 constant dollars. (Amended Appendix H.)

It is SCE's position that the Minimum Buildout Option assuming SCE's proposed route meets the minimum requirements of the Mojave Solar Large Generation Interconnection Agreement (LGIA).

#### Initial Buildout (Proposed Project)

The Initial Buildout Option is SCE's Proposed Project to construct and should serve as the basis for cost considerations for a determination under Public Utilities Code Section 1005.5 of the "maximum cost determined to be reasonable and prudent for the facility."

In comparison to the Minimum Buildout Option, the Initial Buildout also includes double circuit 220kV structures from Coolwater Substation to the existing Lugo-Pisgah No.1 220 kV transmission corridor where Segment 3 meets Segment 5, but under this configuration, both sides of the double circuit structures would be strung instead of just one. The line would initially be configured in a box-loop split-phase configuration thus energized as a single circuit, resulting in an EMF reduction. In the future, when the need arises, the box-loop configuration could be removed to allow operation of the line as two circuits without the need to return to the field to string the second side. The Initial Buildout also includes acquiring the 160-acre parcel for Desert View Substation, but rather than grading and fencing just the 13.5 acres, this option includes grading and installing a wall around approximately 86 acres, but still only includes an initial four

position switchrack, station light and power, and the MEER. Grading the 86 acres, which would be the estimated needed acreage for a future, Full Buildout, would allow SCE to minimize environmental impacts in the future and ensure contiguous grading for the entire substation site needed at Full Buildout. It is SCE's position that the Initial Buildout, by stringing both circuits of the double circuit 220 kV structures and by grading in preparation for the Full Buildout of Desert View Substation, is a prudent planning approach as it would minimize overall environmental impact, maximize the use of ROW consistent with the Garamendi Principles, and minimize overall cost that would otherwise be greater with piece-meal construction.

In the Application, the Initial Buildout Option included the AA bank at the Lugo Substation. SCE has removed that item from the scope of this Option. The Cost of the Initial Buildout in the Application was \$591 million in direct expenditures in 2013 constant dollars. The amended cost for the Initial Buildout is \$509 million in direct expenditures in 2013 constant dollars, reflecting the cost reduction from omitting the AA bank and associated upgrades.

### Full Buildout

The Full Buildout includes the components of the Initial Buildout as well as all components of the 500/220/115/12 kV Desert View Substation, which would be necessary at Full Buildout. In the original Application, the Full Buildout Option included the AA bank at the Lugo Substation. SCE has removed that item from the scope of this Option. In the Application, the cost of the Full Buildout was \$776 million in direct expenditures in 2013 constant dollars. The amended cost of the Full Buildout is \$694 million in direct expenditures in 2013 constant dollars. SCE provided the costs of the Full Buildout for informational purposes only and reflects a cost reduction resulting from the removal of the AA bank.

As stated above, the Initial Buildout is SCE Proposed Project for purposes of cost and construction. However, SCE also requests that the Full Buildout Option be included in the CPCN authorization, so that in the event the need for the Full Buildout Option materializes in the future, SCE can construct that option without delay associated with further licensing. This is consistent with the approach the Commission used in permitting Windhub Substation (also known as Substation One) under the Antelope Transmission Project Segments 2 and 3 (ATP 2-3) CPCN. (D.07-03-045.) In that proceeding, SCE asked for authority to construct portions of the Windhub Substation at a future time under the CPCN Application, without including the costs of Windhub in the costs of ATP 2-3. SCE recognized at the time of filing that although there was not a current defined need for Windhub at full buildout, the need would likely arise in the near future, and, in order to expedite construction when the need arose, SCE included the request for authorization to construct Windhub in its CPCN Application for ATP 2-3.<sup>4</sup> As it happened, the need arose faster than expected, and SCE constructed Windhub almost simultaneously with ATP 2-3.

---

<sup>4</sup> See, SCE's PEA for ATP 2-3 [http://www.cpuc.ca.gov/Environment/info/aspen/atp2-3/PEA/Volume%201/03\\_ProjectDescription.pdf](http://www.cpuc.ca.gov/Environment/info/aspen/atp2-3/PEA/Volume%201/03_ProjectDescription.pdf) (pp.3-26 to 3-27); <http://www.cpuc.ca.gov/Environment/info/aspen/atp2-3/EIR/B-Project%20Description.pdf> (pp B-1,B-3, B-16).

In summary, SCE requests in this Application (1) the authority to construct the Initial Buildout, (2) the consideration of costs associated with the Initial Buildout to specify the “maximum cost determined to be reasonable and prudent for the facility” pursuant to PU Code Section 1005.5, and (3) the authority to construct the Full Buildout of Desert View Substation when the need arises, without further licensing.

### III.

#### **RESPONSES TO INFORMATION REQUESTS IN RULING**

SCE amends A.13-08-023 with the following responses to the information requests included in the March 14, 2014 Ruling (Ruling at 3-7):

1. *A detailed narrative description of the public convenience and necessity claimed for the “Minimum,” “Initial,” and Full” categories of components (Application, Exhibit H)...*

In addition to the specific information requested in the subparts of this question, SCE also provides the following overview of the public convenience and necessity for the Minimum, Initial, and Full Buildout Options:

#### **Minimum Buildout**

Due to existing transmission capacity constraints in the Kramer-Lugo transmission corridor, additional transmission facilities are needed in order to provide the Mojave Solar Project full capacity deliverability consistent with the requirements and the April 11, 2018 operating date specified in the LGIA for the Mojave Solar Project.<sup>5</sup> (Appendix L.) The minimum facilities needed to meet these LGIA requirements, the Coolwater-Lugo Minimum Buildout, include a Coolwater-Lugo 220 kV transmission line with 34.0 miles of double-circuit, single-strung structures (Segments 12, 1, 2, and 3), 13.6 miles of double-circuit double-strung structures (Segments 5 & 5A); an initial four-position Desert View 220 kV Switchrack and

---

<sup>5</sup> Amended Mojave Solar LGIA, <http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13376929>

Mechanical Electrical Equipment Room (MEER) installed within an 86 acre site but with initial grading of only 13.5 acres to consolidate three transmission lines in order to stay within existing ROW between Lugo and Desert View; 16.6 miles of 500 kV single-circuit structures, with 2B-2156 ACSR conductor, initially energized at 220 kV (Segment 7); and supporting telecom and substation work.

#### Initial Buildout (Proposed Project)

In order to minimize overall environmental impact, maximize the use of ROW consistent with the Garamendi Principles, and minimize overall cost that would otherwise be greater with piece-meal construction, SCE is proposing incremental additions to the 34.0 miles of double-circuit, single-strung structures and the 13.5 acre Desert View switchrack described in the Minimum Buildout. SCE has identified likely generation interconnections, load serving, and reliability needs in the Kramer and Lucerne Areas (future Jasper Substation area) that warrant a long term prudent planning approach and which support the Initial Buildout's incremental additions.

The Coolwater-Lugo Initial Buildout would string both sides of the 34.0 mile double circuit structures between Coolwater and the Lugo-Pisgah corridor (where Segment 3 meets Segment 5). The line would initially be configured in a box-loop split-phase configuration thus energized as a single circuit. When additional capacity is needed in the future on these line segments, the box-looped conductors could be separated at the terminating substations and operated as separate circuits to increase transmission capacity, without the need to return to the field to string the second side. Furthermore, rather than grading and fencing just the 13.5 acres for the initial four-position Desert View switchrack and installing a chain link fence, this option includes site grading and installation of a wall around approximately 86 acres, but would still only include an initial four position switchrack, station light and power, and a MEER. Grading the 86 acres now, which would be the estimated needed acreage for a future, Full Buildout, would allow SCE to minimize environmental impacts in the future, eliminate cost associated with installing and later removing temporary facilities in order to expand the switchyard (e.g.

storm water, external driveways), and ensure contiguous grading for the entire substation site needed at Full Buildout.

### Full Buildout

The approximate scope and cost for the Full Buildout, provided for informational purposes, includes the components of the Initial Buildout as well as all components of the 500/220/115/12 kV Desert View Substation, which would be necessary at Full Buildout. These incremental facilities would be triggered by additional generation interconnections, load growth, and reliability needs, all of which could happen concurrently or at different times. As indicated by the RETI, DRECP, and CPUC RPS portfolios, the areas surrounding the Desert View switchrack are rich in renewable resources. Given existing interconnection limitations on the existing Cottonwood-Savage and Apple Valley-Cottonwood-Pluess-Savage 115 kV lines located near the proposed Desert View Substation, future generation interconnection requests could trigger the expansion of the planned 4-position 220 kV switchrack at the Desert View switchyard to include a 115 kV switchrack, associated 220 kV/115 kV transformers, a 12 kV switchrack, and associated 115/12 kV transformers in order to accommodate future third party generation interconnection requests.

Furthermore, as stated in section 1.1.9 in the Amended Chapter 1.0 Purpose and Need on p. 38, these 115 kV and 12 kV facilities could also be triggered by increased electrical demand in the High Desert Region, particularly the Town of Apple Valley. SCE's existing Victor Substation will reach its load serving limits thereby requiring a new major load-serving substation to help serve the High Desert Region load. In the Full Buildout, Desert View would be expanded beyond a 4-position switchrack to include a 115 kV switchrack, associated 220/115 kV transformers, and the two existing 115 kV lines near Desert View would be looped into this 115 kV switchrack in order for Desert View to offload Victor Substation and help serve the electrical demand in the High Desert Region, particularly the Town of Apple Valley. In addition, local load growth around Desert View Substation would trigger the need for a 12 kV switchrack,

associated 115/12 kV transformers, and 12 kV distribution lines in order to serve local area load around Desert View.

Finally, Desert View would also be expanded with 500 kV facilities in order to off load the 500 kV facilities at Lugo Substation. There are currently eight 500 kV transmission lines that terminate at SCE's Lugo Substation. Per the CAISO's 2010-2011 and 2011-2012 Transmission Plans,<sup>6</sup> loss of the entire Lugo 500/220 kV Substation would cause the north of Lugo system to be unstable. To restore system synchronism, extensive generation tripping in the North of Lugo area and load tripping in the LA Basin would be required. Coolwater-Lugo would facilitate construction of a multipurpose 500/220/115/12 kV Desert View Substation which would allow future 500 kV transmission lines to be delooped out of Lugo Substation, thus reducing the number of 500 kV transmission lines terminating at Lugo Substation. This would allow 500 kV system connections to remain which would thereby result in improving overall system reliability by reducing the amount of generation and load that would be needed to be tripped under the loss of Lugo Substation.

*a. Power flow, production cost, transmission planning, resource procurement scenarios, and interconnection studies relied upon for the determination of need, purpose and timing of each component. Indicate who or what agency performed the studies, whether they were the subject of public proceedings or final decision and if so, in what venue the studies were examined, developed and adopted as applicable. Provide a copy of each study, contract and regulatory decision relied upon or referenced for each component included in the CLTP Application.*

---

<sup>6</sup> CAISO's 2010-2011 and 2011-2012 Transmission Plans are confidential and provided pursuant to Public Utilities Code Section 583 under Appendix L. Appendix L contains a Table of Contents listing the documents provided in Appendix L on DVD. Several of the reports listed in Appendix L contain confidential information. Those confidential documents will be provided to the Commission pursuant to Public Utilities Code Section 583. A separate Motion to File Under Seal is being filed concurrently.

The following table notes the location of each requested item of information.

#	Item	Location	Description
1	Power Flow	Chapter 1.0 Purpose & Need (Appendix J)	As described in the Amended Chapter 1.0 Purpose and Need on pp. 1-1 to 1-24, in 2014 there are 1,729 MW of existing generation and 464 MW of existing load, which leads to 1,265 MW of excess generation that needs to get exported from Kramer Substation to Lugo Substation. The existing Kramer-Lugo transmission corridor has approximately a 1,340 MW capacity, so only approximately 75 MW of capacity remains. The Abengoa Mojave Solar Project, interconnecting into the Kramer system is 275 MW (250 MW-Q125 + 25 MW-Q909), so Coolwater-Lugo is needed to provide additional transmission capacity.
2	Production Cost	Amended Appendix H	The Amended Appendix H cost guide provides a dollar amount for each major Coolwater-Lugo Project component. No production costing has been performed.
3	Transmission Planning	Chapter 1.0 Purpose & Need Table 1.0-M "Studies Supporting the Need for Coolwater-Lugo"	Table 1.0-M on pp. 1-20 to 1-22 lists the Transmission Planning and Interconnection Studies that identified the original and continued need for Coolwater-Lugo and contains the date of the study, who the study was performed by, if the study was a public proceeding or Final Decision, and the study results. (Appendix K)
4	Resource Procurement Scenarios	Chapter 1.0-I CPUC RPS Portfolios for LTPP & TPP	Table 1.0-I on p. 1-14 provides RPS Portfolios for the 2014 LTPP and the 2014-15 TPP. (Appendix K)
5	Interconnection Studies	Chapter 1.0 Purpose & Need Table 1.0-M "Studies Supporting the Need for Coolwater-Lugo"	Table 1.0-M on pp. 1-20 to 1-22 lists the Transmission Planning and Interconnection Studies that identified the original and continued need for Coolwater-Lugo and contains the date of the study, who the study was performed by, if the study was a public proceeding or Final Decision, and the study results. The studies are provided in Appendix L.

*b. Provide a table that shows the specific needs and purposes for each element and each category of proposed development (“Minimum,” “Initial,” and “Full”) with a column that shows the estimated date when each component is needed. Specify whether the component is needed to fulfill contractual obligations for interconnection of the Mojave Solar Project.*

Table 1.0-O Purpose & Need Justification for Coolwater-Lugo Elements, located in the Amended Chapter 1 Purpose and Need on pp. 1-28 to 1-30, lists each major Project component from the Amended Appendix H Cost Table and explains its purpose and need, notes the estimated date when the component is needed, and whether it is required to fulfill the contractual obligations for interconnection of the Mojave Solar Project. Table 1.0-O is also provided in Appendix K to this Amended Application.

*c. Identify any and all components included in the CLTP that require future California Independent System Operator (CAISO) study, review or approval.*

Table 1.0-O Purpose & Need Justification for Coolwater-Lugo Elements, located in the Amended Chapter 1 Purpose and Need on pp. 1-28 to 1-31, provides a column that indicates if components require future CAISO study, review or approval. Table 1.0-O is also provided in Appendix K to this Amended Application.

*2. Include the January 30, 2011 Large Generator Interconnection Agreement (LGIA) between SCE, the CAISO and Abengoa Solar Inc. (Abengoa) for the Mojave Solar Project.*

Appendix L contains the original Abengoa Mojave Solar LGIA dated January 20, 2011, and also the amended LGIA dated October 24, 2013. The amended LGIA contains developer name changes, facility name changes, FERC Filing Abandoned Plant Approval updates, and Project Milestone updates.

*3. Provide a Joint Statement of Need and Purpose by individual CLTP project component required for interconnection of the Mojave Solar Project with full deliverability by the LGIA, representing an agreement by SCE, CAISO and Abengoa confirming the representations made by SCE, the CAISO and Mojave Solar, LLC at the December 17, 2013 PHC. If the LGIA Parties cannot agree, explain SCE's position regarding what interconnection facilities are required by the LGIA, by each individual proposed CLTP project component, and an explanation of the remaining disagreements between the LGIA Parties. Include a description of the Mojave Solar Project's expected output, online*

*date and references to any other relevant documents, including related contracts or regulatory decisions.*

The Joint Statement of SCE, CAISO, and Mojave Solar, LLC, is attached as Appendix M. The Mojave Solar Project will be capable of a maximum output of 275 MW (250 MW-Q125 + 25 MW-Q909).<sup>7</sup> Due to the existing Kramer-Lugo corridor transmission capacity constraints, when the Mojave Solar Project comes on-line on July 7, 2014, its generation output will be limited by these constraints and other third party generation that will also be competing for any existing transmission capacity. Therefore, the expected output of the Mojave Solar Project will be between 0 to 275 MW based on these constraints and the simultaneous output of the other third party generators in the Kramer System. Per the amended LGIA, SCE is required to construct the necessary network upgrades to provide the Mojave Solar Project with full deliverability by April 11, 2018. The original LGIA, amended LGIA, and the FERC decisions approving these LGIAs are contained in Appendix L.

*4. SCE stated that CLTP is needed “to provide additional transmission capacity to help alleviate the 220 kilovolt transmission bottleneck between the existing Kramer and Lugo Substations.” (Application at ES-2.)*

*a. Include a detailed powerflow explanation of the bottleneck and any other relevant studies by SCE, the CAISO or other entity upon which SCE has relied.*

As described in the Amended Chapter 1.0 Purpose and Need pp. 1-1 to 1-24, in 2014 there are 1,729 MW of existing generation and 464 MW of existing load, which leads to 1,265 MW of excess generation that needs to get exported from Kramer Substation to Lugo Substation. The existing Kramer-Lugo transmission corridor has approximately 1,340 MW of capacity, so only approximately 75 MW of transmission capacity remains. The Abengoa Mojave Solar Project, interconnecting into the Kramer system is 275 MW (250 MW-Q125 + 25 MW-Q909),

---

<sup>7</sup> Q125 is Abengoa Mojave Solar’s initial 250 MW interconnection request, and Q909 is Abengoa’s 25 MW subsequent interconnection request to increase their 250 MW to 275 MW.

so Coolwater-Lugo is needed to provide additional transmission capacity to make the Mojave Solar Project's 275 MW fully deliverable.

Figure 1.0-A on p. 1-2 of the Amended Chapter 1.0 Purpose and Need provides a block diagram illustration of the existing Kramer-Lugo and Jasper-Lugo transmission corridor constraints, identifies the existing generation in the Kramer System, the existing load in the Kramer System, and the resulting excess generation in the Kramer System that is exported from Kramer Substation to Lugo Substation. Table 1.0-A on pp. 1-3 to 1-5 depicts the existing generation in the Kramer System. Furthermore, Table 1.0-M on pp. 1-20 to 1-22 lists the Transmission Planning and Interconnection Studies that identified the original and continued need for Coolwater-Lugo and contains the date of the study, who the study was performed by, if the study was a public proceeding or Final Decision, and the study results. These figures, tables, and studies are also provided in Appendices K and L to this Amended Application.

*b. Include any studies or resource scenarios that identify existing and planned generation resources included in the analysis of the bottleneck. Include for each resource: 1) nameplate capacity, 2) anticipated date of retirement and 3) fuel type.*

Table 1.0-A on pp. 1-3 to 1-5 of the Amended Chapter 1.0 Purpose and Need, lists the existing generation in the Kramer System and identifies the nameplate capacity, anticipated date of retirement, and fuel type. Furthermore, Table 1.0-M on pp. 1-20 to 1-22 of the Amended Chapter 1.0 Purpose and Need lists the Transmission Planning and Interconnection Studies that identified the original and continued need for Coolwater-Lugo. These tables and studies are also provided in Appendices K and L to this Amended Application.

*c. Include a year-by-year analysis going forward for the planning horizon applicable to the components designed to address the Kramer-Lugo substation bottleneck.*

The capacity of Coolwater-Lugo and its continued ability to relieve transmission constraints in the Kramer-Lugo and Lugo-Pisgah Corridors will be tied to load growth, third party generation projects pursuing development in the Kramer Area and at future Jasper Substation, and the specific point of interconnections (POI) of those third party generation

projects. Because SCE has no control over the timing and location of third party generation interconnection requests, it would be impossible to perform a year-by-year analysis going forward for the planning horizon applicable to the components designed to address the Kramer-Lugo Substation bottleneck. However, the generation interconnection studies identified in Table 1.0-M on pp. 1-20 to 1-22 of the Amended Chapter 1.0 Purpose and Need have considered a wide range of load forecasts and actual queued generation scenarios and demonstrate the effectiveness of Coolwater-Lugo at relieving existing transmission constraints under those various scenarios. Table 1.0-M and associated studies are also provided in Appendices K and L to this Amended Application.

*5. SCE stated that CLTP is needed “to facilitate the interconnection of renewable generation projects such as, the new planned generation resources located in the Barstow, Inyokern, Kramer Lucerne Valley/future Jasper Substation, Apple Valley, and Owens Valley areas.” (Application at ES-2.) Identify each renewable generation project to which this statement refers.*

Tables 1.0-B, 1.0-C, and 1.0-D, located in the amended Chapter 1.0 Purpose and Need on pp. 1-8 to 1-11, list all the currently queued generation projects requesting interconnection in the Kramer Area and at Jasper Substation. These tables list the Renewable Energy Transmission Initiative (RETI) Competitive Renewable Energy Zones (CREZs) and the Desert Renewable Energy Conservation Plan (DRECP) development focus areas (DFAs) for each queued generation project. Furthermore, Tables 1.0-E, 1.0-F, 1.0-G, 1.0-H, 1.0-I, located in the amended Chapter 1.0 Purpose and Need on pp. 1-12 to 1-14, note anticipated renewable development in the Kramer and Lucerne Valley Areas as indicated in the RETI Phase 2B Report, the DRECP December 17, 2012 report, and the RPS Portfolios for the 2014 Long Term Procurement Portfolio and the 2014-2015 Transmission Planning Process. These documents are provided in Appendix L.

*6. The PEA states that the project would serve “up to 1,000 megawatts (MW) of renewable resources located in the Kramer and Lucerne Valley areas.” (PEA at 1-5*

*through 1-7.) The PEA provides lists of specific projects adding up to more than 1,000 MW and some of those projects are merely in the study phase.*

*a. Provide an expected timeline of when each projected renewable generation project to be served by the CLTP is likely to come on-line, and how the proposed project would specifically serve it. Provide a description, with specific references, of the extent that any of these projects are included in the CPUC's Renewable Portfolio Standard portfolios and the Desert Renewable Energy Conservation Plan process.*

Tables 1.0-B, 1.0-C, and 1.0-D, located on pp. 1-8 to 1-11 in the amended Chapter 1.0 Purpose and Need, list all the currently queued generation projects requesting interconnection in the Kramer Area and at the future Jasper Substation and provide the generators' requested online date. Table 1.0-N, located on pp. 1-22 to 1-23 of the Amended Chapter 1.0 Purpose and Need, explains how each project in queue is served by Coolwater-Lugo.

Furthermore, Tables 1.0-G, 1.0-H, and 1.0-I, located in the amended Chapter 1.0 Purpose and Need on pp. 1-13 to 1-14, note anticipated renewable development in the Kramer and Lucerne Valley areas, which correlates to the future Jasper Substation, as indicated in the DRECP December 17, 2012 report and the RPS Portfolios for the 2014 Long Term Procurement Portfolio and the 2014-2015 Transmission Planning Process. Per Appendix L of the DRECP December 17, 2012 report, the renewable energy estimates in Tables 1.0-G and 1.0-H are based on the Renewable Energy Calculator, cited in Appendix L of the report, which is a spreadsheet calculator for matching estimated future demand to a possible future renewable technology mix, while also meeting California's greenhouse gas emission reduction goals.<sup>8</sup> (Appendix L.) Since the DRECP data is based on a calculator and not existing queued generation, Tables 1.0-G and 1.0-H indicate in which DRECP DFA the queued generation projects would be located.

---

<sup>8</sup> [http://www.drecp.org/documents/docs/alternatives\\_eval/Appendices/Appendix\\_L\\_Estimating\\_Future\\_Generation\\_Capacity.pdf](http://www.drecp.org/documents/docs/alternatives_eval/Appendices/Appendix_L_Estimating_Future_Generation_Capacity.pdf) (p. L-1)

Moreover, the RPS Portfolios for the 2014 Long Term Procurement Portfolio and the 2014-2015 Transmission Planning Process are created by the CPUC and California Energy Commission (CEC) using the RPS Calculator and vetted via a public stake holder process.<sup>9</sup> (Appendix L.) Supporting documentation for the RPS Portfolios notes queued generation projects Q125 and Q909 were included in the process.

Tables 1.0-B, 1.0-C, 1.0-D, 1.0-G, 1.0-H, and 1.0-I are also provided in Appendix K to this Amended Application.

*b. For each project for which CLTP is proposed to serve, provide the status within both SCE's and the CAISO's interconnection queue as to queue priority, permitting status, electrical studies, executed LGIAs or Purchase Power Agreements (PPAs).*

Tables 1.0-B, 1.0-C, and 1.0-D, located on pp. 1-8 to 1-11 in the Amended Chapter 1.0 Purpose and Need, list all the currently queued generation projects requesting interconnection in the Kramer and the Lucerne Valley Areas and provide their queue priority status, permitting status, electrical study status, and whether or not the projects have executed LGIAs or Purchase Power Agreements.

Tables 1.0-B, 1.0-C, and 1.0-D are also provided in Appendix K to this Amended Application.

*c. For each project in the CAISO queue, provide the quantity and status of each project's deliverability allocation.*

Tables 1.0-B, 1.0-C, and 1.0-D, located on pp. pp. 1-8 to 1-11 in the amended Chapter 1.0 Purpose and Need, list all the currently queued generation projects requesting interconnection in the Kramer and Lucerne Valley Areas and provide the quantity and status of each project's deliverability allocation.

<sup>9</sup> [http://www.cpuc.ca.gov/NR/rdonlyres/589B90C6-DC13-47E0-89D5-6448BAE8A725/0/AmendedAttachment022714\\_ACR.pdf](http://www.cpuc.ca.gov/NR/rdonlyres/589B90C6-DC13-47E0-89D5-6448BAE8A725/0/AmendedAttachment022714_ACR.pdf) (pp. 22-25)

Tables 1.0-B, 1.0-C, and 1.0-D are also provided in Appendix K to this Amended Application.

*d. Explain whether the 1,000 MW of renewable generation cited in the Application includes or is incremental above the 250 MW Mojave Solar Project.*

Per the amended Chapter 1.0 Purpose and Need, Coolwater-Lugo, without the Lugo No.3AA 500/220 kV transformer bank, Coolwater-Lugo would ensure the deliverability<sup>10</sup> (Appendix L) of the Commercial Interest Portfolio's 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan. (Appendix L 2012-2013 CAISO Annual Transmission Plan at 155.) Deliverability, from the perspective of individual generator resources, ensures that, under normal transmission system conditions, if capacity resources are available and called on, their ability to provide energy to the system at peak load will not be limited by the dispatch of other capacity resources in the vicinity from a resource adequacy perspective.

From a reliability perspective, without installation of a Lugo No.3AA 500/220 kV transformer bank, the capacity of Coolwater-Lugo would be dictated by the remaining capacity of the existing Lugo No.1AA & No.2AA 500/220 kV transformer banks which have an anticipated remaining approximate capacity between 500 MW to 1,000 MW in the year 2018 under minimum to maximum load conditions. Reliability, from the perspective of individual generator resources, ensures that, under normal and abnormal transmission system conditions, if capacity resources are available and called on, they are able to provide energy to the system under minimum to maximum load conditions compliant with Reliability Standards and the Regional Business Practices developed by the CAISO, WECC, NERC, and the individual utility. The 275 MW Mojave Solar Project would be included and not incremental to these capacity estimates.

---

<sup>10</sup> <http://www.caiso.com/Documents/On-PeakDeliverabilityAssessmentMethodology.pdf> (p. 1)

*e. For each project included in the 1,000 MW of renewable generation cited in the Application that is an existing (not new or planned) resource, provide the nameplate capacity amount, resource/generation fuel type and expected retirement date for each resource.*

Table 1.0-A, located on pp. 1-3 to 1-5 in the amended Chapter 1.0 Purpose and Need, provides the nameplate capacity amount, resource/generation fuel type and the expected retirement date for each resource.

Table 1.0-A is also provided in Appendix K to this Amended Application.

*7. SCE stated that CLTP is needed “to accommodate future load serving in the Town of Apple Valley.” (Application at ES-2.) Provide detailed load forecasts that identify and quantify this future load.*

*a. If the load forecasts on which SCE relied was not prepared by the CEC, then 1) compare the SCE forecasts to the load forecast used by the CAISO in the last most recent CAISO Transmission Planning Process (TPP) and; 2) compare the SCE forecasts with the most recent CEC-adopted forecast and 3) compare the forecast included in the CPUC’s last, most recent Long Term Procurement Plan (LTPP) proceeding prior to filing the Application. If SCE adjusted CEC-adopted forecasts or other adopted forecasts, provide the methodology for the adjustments and the actual calculations made using those adjustments.*

In Section 1.1.9 of the amended Chapter 1.0 Purpose and Need, p. 39, Figure 1.1-A depicts the Victor Substation load forecast from the 2013-2014 CAISO Transmission Plan, which is based on the CEC 1-in-10 year load forecast. By plotting the load forecast data, the equation of the curve can be calculated and used to approximate the load forecast in the future. Victor Substation’s load serving limit under a single contingency on one of its four high voltage transformers is between 979 MW to 1,042 MW. Based on this approximated future load forecast and the Victor Substation load serving limit range, a new load serving substation would be required in the High Desert Region to relieve Victor Substation between the approximate years

2025 and 2029, as depicted in Figure 1.1-B on p. 41. Since the load forecasts that SCE relied upon were prepared by the CEC, questions 7a-1 to 7a-3 are not applicable.

Figures 1.1-A and 1.1-B are also provided in Appendix K to this Amended Application.

*b. Describe which CLTP components are designed to serve the Apple Valley load, in what years and any further explanation of the facilities designed and proposed to serve the Apple Valley load.*

As described in Section 1.1.9 of the amended Chapter 1.0 Purpose and Need on pp. 41-42, the specific Desert View elements required to provide load serving relief to Victor Substation include the following major facilities, which would be phased in as necessary over the 2025 to 2029 time period, starting with the 220 kV and 115 kV facilities:

1. Extension of the Desert View 220 kV Switchrack beyond the initial four-position switchrack
2. Installation of at least one of the planned four 220/115 kV transformers but two would be recommended for reliability
3. A 115 kV switchrack
4. Looping of the existing Cottonwood-Savage 115 kV line<sup>11</sup> into the Desert View 115 kV Switchrack
5. Looping of the existing Apple Valley-Cottonwood-Pluess-Savage 115 kV line<sup>12</sup> into the Desert View 115 kV Switchrack
6. Installation of at least one of the planned four 115/12 kV transformers
7. A 12 kV switchrack
8. One or more 12 kV distribution lines from the Desert View 12 kV Switchrack into the nearby neighborhood surrounding Desert View Substation

---

<sup>11</sup> The Cottonwood-Savage 115 kV line is an existing line that runs east-west approximately 0.7 miles north of the proposed and alternate Desert View Substation sites.

<sup>12</sup> The Apple Valley-Cottonwood-Pluess-Savage 115 kV line is an existing line that runs east-west approximately 0.1 miles south of the proposed and alternate Desert View Substation sites.

Once the Desert View 115 kV Switchrack is in place, the Cottonwood-Savage and Apple Valley-Cottonwood-Pluess-Savage 115 kV lines would be looped into the 115 kV Switchrack allowing Desert View to serve the load on these lines that was previously being served from Victor Substation. In addition, the future Desert View 12 kV Switchrack and future 12 kV distribution lines out of Desert View would serve local area load of the nearby expanding community.

*8. SCE stated that CLTP is needed “to facilitate additional system reliability.”*

*(Application at ES-2.)*

*a. Provide a detailed description of the system reliability benefits SCE attributed to the CLTP.*

As described in Section 1.1.10 in the Amended Chapter 1.0 Purpose and Need on pp. 42 to 44, the existing Lugo-Pisgah No.1 & No.2 220 kV transmission lines currently have line protection that meets existing CAISO, NERC, and WECC reliability criteria, but which is not aligned with SCE’s current line protection standards. Since Coolwater-Lugo would tear down and rebuild approximately 29.1 miles of the Lugo-Pisgah No. 1 220 kV line and also tear down approximately 16.0 miles of the existing Lugo-Pisgah No.2 220 kV line, the line protection from Lugo to Pisgah Substations will need to be upgraded to current SCE standards, which will reduce fault clearing times and improve overall system reliability.

In addition, the Coolwater 220 kV Switchrack is currently a radial facility not under CAISO control. Construction of Coolwater-Lugo would convert the Coolwater 220 kV Switchrack from a radial facility to a network facility, which would then be under CAISO control. The Coolwater-Lugo work at the Coolwater 220 kV Switchrack would include augmenting the existing disconnect switches on switch rack positions 1, 3, and 6 with circuit breakers in order to isolate faults on those positions from affecting the rest of the switchrack. These upgrades would increase the reliability of the Coolwater 220 kV Switchrack in its new network configuration, would simplify future additions, minimize loss of station capacity during planned outages, and improve the selectivity of the system protection.

Moreover, there are currently, eight 500 kV transmission lines that terminate at SCE's existing Lugo Substation. Per the CAISO's 2010-2011 and 2011-2012 Transmission Plans (Appendix L), loss of the entire Lugo 500/220 kV Substation would cause the north of Lugo system to be unstable. To restore system synchronism, extensive generation tripping in the North of Lugo area and load tripping in the LA Basin would be required. Coolwater-Lugo would facilitate construction of a multipurpose 500/220/115/12 kV Desert View Substation which would allow future 500 kV transmission lines to be delooped out of the Lugo Substation thus reducing the number of 500 kV transmission lines terminating at Lugo Substation. This would allow 500 kV system connections to remain which would result in improving overall system reliability.

*b. Provide a clear explanation of the individual components included in the CLTP that would provide those system reliability benefits identified and how each component is designed to solve the identified system reliability issues identified.*

As described in Section 1.1.10 in the amended Chapter 1.0 Purpose and Need on p. 43, the line protection from Lugo to Pisgah Substations will be upgraded to current SCE standards, which will reduce fault clearing times and improve overall system reliability. Specifically, the existing directional and ground-over-current and step distance protection provided by the existing electromechanical relays on the existing Lugo-Pisgah No.1 and No.2 220 kV lines would be replaced by G.E. L90 and SEL-311L relays with new telecom circuits to provide high speed fault clearing. High speed fault clearing helps to reduce (i) damage to power system equipment, (ii) injury to SCE personnel and the public, and (iii) extended and widespread outages because the faults are detected and isolated more quickly to minimize their effect.

In addition, the Coolwater 220 kV Switchrack is currently a radial facility not under CAISO control. Construction of Coolwater-Lugo would convert the Coolwater 220 kV Switchrack from a radial facility to a network facility, which would then be under CAISO control. The Coolwater-Lugo work at the Coolwater 220 kV Switchrack would include augmenting the existing disconnect switches on switch rack positions 1, 3, and 6 with circuit

breakers in order to isolate faults on those positions from affecting the rest of the switchrack. Adding circuit breakers to these rack positions would convert them to “double bus double breaker” positions, which is SCE’s 220 kV design standard. This arrangement ensures reliability is maintained under outage conditions (forced outage or during maintenance) since it allows for the loss of equipment connected to the substation to be removed from service without affecting all other facilities connected to the substation during such an outage condition. . These upgrades would increase the reliability of the Coolwater 220 kV Switchrack in its new network configuration, would simplify future additions, minimize loss of station capacity during forced or planned outages, and improve the selectivity of the system protection.

Moreover, there are currently, eight 500 kV transmission lines that terminate at SCE’s existing Lugo Substation. Per the CAISO’s 2010-2011 and 2011-2012 Transmission Plans (Appendix L), loss of the entire Lugo 500/220 kV Substation would cause the north of Lugo system to be unstable. To restore system synchronism, extensive generation tripping in the North of Lugo area and load tripping in the LA Basin would be required. Coolwater-Lugo would facilitate construction of a multipurpose 500/220/115/12 kV Desert View Substation which would allow future 500 kV transmission lines to be delooped out of the Lugo Substation thus reducing the number of 500 kV transmission lines terminating at Lugo Substation This would allow 500 kV system connections to remain which would result in improving overall system reliability by reducing the amount of generation and load that would be need to be tripped under the loss of Lugo Substation.

*c. Identify and include a copy as an attachment any CAISO studies that describe, quantify and provide timing for the system reliability issues for which CLTP is claimed to address or resolve.*

Regarding the Lugo-Pisgah line protection reliability improvements, the CAISO does not specify or approve line protection. Furthermore, regarding the reliability improvements to the Coolwater 220 kV Switchrack, the CAISO does not specify or approve switchrack changes either. Line protection and switchrack improvements are under the Participating Transmission

Owner's (PTO) design specifications which are in place to meet applicable NERC and WECC reliability criteria.

The CAISO's 2010-2011 and 2011-2012 Transmission Plans, describe the loss of the entire Lugo 500/230 kV Substation and quantify that this event would cause the north of Lugo system to be unstable. However, these reports do not provide timing for any mitigation to resolve this reliability issue. CAISO's 2010-2011 and 2011-2012 Transmission Plans are provided in Appendix L.

*9. Attach a copy of the December 12, 2008 Interconnection Study and the 2010/2011 Annual TPP Study referenced by counsel for SCE at the December 17, 2014 PHC. (Transcript at 13.)*

The April 2, 2007 Harper Lake Solar Plant Generation Interconnection Feasibility Study, the June 27, 2008 Harper Lake Solar Plant Project, the October 30, 2009 Harper Lake Solar Plant Interconnection Facilities Study, and the CAISO 2010-2011 Transmission Plan studies are provided in Appendix L.

#### IV.

#### **ELIGIBILITY FOR 399.2.5 RECOVERY**

This section is unchanged from the August 28, 2013 Application.

#### V.

#### **PROJECT COST INFORMATION**

Coolwater-Lugo (whose scope represents the majority of what was formerly referred to as the South of Kramer Project) would ensure the deliverability of the Commercial Interest Portfolio's 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan. (Appendix L CAISO 2012-2013 Annual Transmission Plan at 155.) Under minimum load conditions, the amount of incremental generation output that could be accommodated by Coolwater-Lugo would be limited

to approximately 500 MW,<sup>13</sup> due to incremental congestion on the existing Lugo No.1AA and No.2AA 500/220 kV transformer banks resulting from lower load demand. is required to facilitate the interconnection of a minimum of up to 1000 MW of new generation in the Kramer Junction and Lucerne Valley area of San Bernardino County by increasing transmission capacity between existing Lugo Substation and Coolwater Switchyard . For Coolwater-Lugo, SCE investigated various alternatives to increase this transmission capacity.

As discussed in the PEA, Chapter 2, there are two alternative transmission line paths. The first alternative is based on different corridor options in the north end of the project out of Coolwater Switchyard and the south end of the project out of Lugo Substation. The second alternative is the same as the first except in the vicinity of the Marine Corps Logistics Base Barstow in the north end of the project. PEA Figure 2.1-C depicts the proposed and two alternative routes. To accommodate this new transmission capacity, SCE would also construct a new Desert View Substation (initially constructed as a switchyard) at an Initial Buildout and modify existing Coolwater Switchyard and existing Lugo Substation, and construct the necessary telecommunications facilities to support the project.

In compliance with Public Utilities Code § 1005.5(a),<sup>14</sup> SCE developed estimated costs for alternative solutions identified for Coolwater-Lugo. For each solution, SCE estimated the costs for the project's direct costs and contingency. The following describes the estimated costs for Coolwater-Lugo broken down by cost type, followed by a discussion about the alternative solutions and SCE's proposed solution. All costs are provided in 2013 constant dollars, unless

---

<sup>13</sup> Without installation of a Lugo No.3AA 500/220 kV transformer bank, the capacity of Coolwater-Lugo would be dictated by the remaining capacity of the existing Lugo No.1AA & No.2AA 500/220 kV transformer banks which have an anticipated remaining capacity of approximately 500 MW in the year 2018 under minimum load conditions.

<sup>14</sup> Pub. Util. Code § 1005.5(a) provides that: "Whenever the commission issues to an electrical . . . corporation a certificate authorizing the new construction of any addition to or extension of the corporation's plant estimated to cost greater than fifty million dollars (\$50,000,000), the commission shall specify in the certificate a maximum cost determined to be reasonable and prudent for the facility."

otherwise noted. As shown in Amended Appendix H, the total estimated project direct costs for the variations of the proposed solution presented in this testimony range from \$460 million to \$694 (or \$621 to \$936 including 35% contingency) million in 2013 constant dollars.

Consistent with SCE's request in A.09-05-027 (Eldorado-Ivanpah Transmission Project), and the resulting Commission decision (D.10-12-052), SCE proposes the use of deflation factors to convert actual expenditures in future years to their equivalent value in 2013 dollars. SCE believes the deflation factors should be calculated using an index such as the Handy-Whitman Index of Public Utility Construction Costs and considering other factors that have significant influences on the cost of the project.

#### **A. Estimated Direct Costs of Coolwater-Lugo**

Estimated direct costs include costs for preliminary and final engineering, construction, labor, materials, real estate, telecommunications and project support based on preliminary scopes of work for the different project components.

The primary components of Coolwater-Lugo include:

- **Transmission Lines:** Removal of approximately ~~45~~ 29.1 miles of the existing Lugo-Pisgah No.1 ~~and No. 2~~ 220 kV transmission lines between the existing Lugo Substation and the intersection of Haynes Road and SR-247 and 16.0 miles of the existing Lugo-Pisgah No. 2 220 kV transmission line between the existing Lugo Substation and the proposed Desert View Substation; installation of approximately 48 miles of 220 kV double circuit transmission lines between the existing Coolwater Switchyard and proposed Desert View Substation; and installation of approximately 17 miles of a 500 kV single circuit transmission line with 2B-2156 ACSR conductor (initially energized at 220 kV) between the proposed Desert View Substation and existing Lugo Substation.
- **Substations:** Installation of the new Desert View Substation with Initial Build Out; modifications to the Lugo Substation and the Coolwater Switchyard.

- **Environmental:** Compliance with environmental mitigation, monitoring and restoration requirements.
- **Other:** Complete preliminary engineering and licensing; acquisition of the necessary real estate rights for the project; communication systems upgrades for grid operations; and distribution upgrades.

The scope of work for these components is discussed in greater detail in the PEA, Chapter 3, Project Description. The estimated costs were developed based on SCE's extensive and recent experience in estimating and constructing similar recent projects. SCE's estimated direct costs include labor, materials, equipment, and real estate. Labor costs include field personnel and project support costs. Field personnel costs are based on assumptions for the make up of various crews required to safely and effectively construct the project's components. Project support costs represent resources required to support the construction activities, including but not limited to project management, project controls, environmental monitoring, and permitting. Material and equipment costs include but are not limited to estimates for steel, concrete, transformers, insulators, transmission and distribution conductors, and Optical Ground Wire ("OPGW"). Estimated real estate costs are also included for expected right of ways required from private and public lands. Estimates of the expected direct costs by the primary components and, where applicable, alternatives are listed in Amended Appendix H.

#### **B. SCE's Contingency Estimate**

This section is unchanged from the August 28, 2013 Application.

#### **C. Summary Of Estimated Costs For Coolwater-Lugo And Alternatives**

The costs associated with the proposed and alternative project scopes of work are broken down in the project cost table, Amended Appendix H. The left side of the table lists the potential scope elements grouped by the following categories: licensing, substation, transmission lines rated 200 kV or greater, transmission lines rated below 200 kV, distribution line work, telecommunication elements, real estate, and environmental work. The estimated costs are provided next to each element. The alternatives considered for Coolwater-Lugo are primarily

based on the alternative routes for the transmission lines rated 200 kV or greater. Each alternative is based on a combination of twelve distinct line segments. SCE has developed three alternatives based on these segments: the Proposed Project, Alternative Project with Segment 9, and Alternative Project with Segment 10. Between these alternatives, the scope of the other elements varies in order to accommodate the different routes.

As noted in the Amended Appendix H, the first build out of Desert View Substation can vary between the alternatives and within each alternative. For the Proposed Project, “Minimum” includes switchrack with limited fencing and limited civil work, and “Initial” includes a switchrack with grading of the entire site and wall enclosure around the entire site. For both Alternative with Segment 9 and Alternative with Segment 10, “Minimum” includes dead-end rack with limited fencing and limited civil work, and “Initial” includes dead-end rack with grading of the entire site and wall enclosure around the entire site. “Full” refers to full build out of the Desert View Substation including all necessary equipment for the proposed and alternate projects. Similarly, the 220kV configuration between Coolwater and the existing Lugo-Pisgah No. 1 220 kV transmission corridor varies between the “Minimum,” “Initial,” and “Full” Buildout options. “Minimum” consists of double circuit 220kV towers, with only one side strung, while “Initial” and “Full” consist of 220kV towers with both sides strung.

In summary, the PEA project description and Amended Appendix H will have three levels and cost totals for each route alternative:

- Minimum Buildout – This would include the minimum required components needed to satisfy the Mojave Solar Project LGIA and full capacity deliverability. This will have double-circuit structures strung on one side only for the Coolwater to Jasper area line, 220 kV double-circuit from the Jasper area to Desert View, 500kV construction energized at 220kV from Desert View to Lugo, and the minimum switchrack dimensions of the Desert View Substation site graded and fenced. No Lugo 500kV upgrades or additional AA bank would be proposed.

- Initial Buildout (Proposed Project)– This option is the SCE’s proposed project build out. This option will add the second circuit strung in a "box-loop" configuration from Coolwater to the Jasper area, and the grading and fencing of the entire Desert View Substation site. No Lugo 500kV upgrades or additional AA bank would be proposed.
- Full Build-Out – At the full build out and dependent upon the CAISO’s studies and approval, this will add the construction of the complete Desert View Substation. .

The direct cost estimates are represented in 2013 constant dollars, as reflected in Amended Appendix H. Including a contingency level consistent with SCE’s recent CPCN applications and what a reasonable contingency would be for a project at the conceptual stage of engineering, the total project direct costs are estimated to vary between \$460 million to \$694 (or \$621 to \$936 including 35% contingency) million in 2013 constant dollars for the Minimum, Initial, and Full Buildout Options of Coolwater-Lugo.

There are two methods by which SCE can recover financing costs: (1) Allowance for Funds Used During Construction (“AFUDC”), and (2) Construction Work in Progress (“CWIP”) in SCE’s rate base. FERC has authorized CWIP, which is applicable to the qualified elements of scope contained in SCE’s petition.<sup>15</sup> Consistent with past CPCNs, the financing costs during the project development and execution are not included in a CPCN finding of maximum prudent cost. However, SCE is providing an estimate of the financing costs during the project development and execution. For the proposed Initial scope that does not include contingency, the estimated financing costs during project development and execution are estimated to be \$120 million in nominal dollars. This is based on the cost estimate in Amended Appendix H and uses conceptual schedule assumptions. Actual financing costs may vary and will be based on actual spend and schedule and use of contingency.

Similarly, the operating and maintenance (“O&M”) costs for the associated assets are not included in a CPCN maximum prudent cost finding. Coolwater-Lugo is expected to have assets

---

<sup>15</sup> See 134 FERC ¶61,181 in Docket EL11-10-000, issued March 11, 2011.

in service for decades. Currently, there are many uncertainties concerning the final scope of Coolwater-Lugo and, therefore, the scope of future O&M for a major project like Coolwater-Lugo. Not only would the final scope impact what needs to be operated and maintained for decades, but the related requirements and field methods are expected to evolve over time. Ultimately, SCE will seek recovery for the O&M costs in a rate case proceeding. SCE is providing an estimate of annual operating and maintenance costs to be approximately \$13 million in 2013 constant dollars. This is based on a simplified system average calculations consistent with SCE's Formula Transmission Rate Informational Filing contained in FERC Docket No. ER-11-3697, dated September 14, 2012. SCE expects future actual operating and maintenance costs to vary from this amount and vary from year to year given that the project useful life spans over decades.

## VI.

### **PUBLIC UTILITIES CODE § 1005 AND ADJUSTMENT OF THE MAXIMUM REASONABLE AND PRUDENT COST ESTIMATE**

This section is unchanged from the August 28, 2013 Application.

## VII.

### **PROCEEDING CATEGORY, NEED FOR HEARINGS, AND SCHEDULE**

In compliance with Rule 2.1(c) of the Commission's Rules of Practice and Procedure (California Code of Regulations Title 20), SCE is required to state in this Application "the proposed category for the proceeding, the need for hearing, the issues to be considered, and a proposed schedule." SCE proposes to categorize this Application as a ratesetting proceeding. SCE anticipates that hearings will be necessary. This proceeding involves the Commission's (i) environmental review of the Coolwater-Lugo in compliance with CEQA and the Commission's G.O. 131-D; and (ii) issuance of a CPCN authorizing SCE to construct the Coolwater-Lugo.

SCE suggests the following proposed schedule for this Application. The schedule assumes the Commission will approve the Environmental Impact Report at a Commission Meeting following shortly after the expiration of the one-year period following the Commission's acceptance of a complete application as required by Public Resources Code § 21100.2.

Application Filed	8/28/2013

## VIII.

### DEPOSIT FOR COSTS

Pursuant to Rule 2.5 of the Commission's Rules of Practice and Procedure, SCE sent the filing fee of \$75.00 to the Commission's Docket Office on August 28, 2013. Additionally, SCE has complied with Rule 2.5 by sending a deposit in the amount of \$153,157 to the Commission's Energy Division on August 28, 2013, to be applied to the costs of the Commission to prepare an environmental impact report for this project. ~~The remaining deposits will be sent to the~~

Commission according to the schedule, which is set forth in Rule 2.5(e). The remaining deposits have been paid.

**IX.**

**LOCATION OF ITEMS REQUIRED BY PUBLIC UTILITIES CODE SECTION 1003, COMMISSION’S RULES, AND GENERAL ORDER 131-D**

The Public Utilities Code, the Commission’s Rules of Practice and Procedure, and the Commission’s General Orders require various items of information to be submitted with CPCN applications. The table below lists the items, the authority which dictates the submittal, and references where the information is included in SCE’s filing.

<b>CPCN APPLICATION FILING REQUIREMENTS</b>			
<b>Requirement</b>	<b>Authority</b>	<b>Appendix</b>	<b>PEA</b>
A detailed description of the proposed project	G.O. 131-D, IX.A.1.a; Rule 3.1(a); Public Utilities Code 1003(a)		3.0
A project map	G.O. 131-D, IX.A.1.b; Rule 3.1(c)		Figure 3.1-B
A purpose and need statement	G.O. 131-D, IX.A.1.c; Rule 3.1(c)		1.0
Project Implementation Plan	Public Utilities Code 1003(b)	Appendix A Project Plan	
Design, Construction Management and Cost Control Plan	Public Utilities Code 1003(e)	Appendix A Project Plan	
A detailed statement of the estimated cost ( <u>Amended</u> )	G.O. 131-D, IX.A.1.d; Rule 3.1(f); Public Utilities Code 1003(c)	<u>Amended</u> Appendix H	
Route selection including comparison with alternative routes	G.O. 131-D, IX.A.1.e		2.0
A project schedule showing the program of right-of-way acquisition and construction	G.O. 131-D, IX.A.1.f	Appendix A Project Plan	

<b>CPCN APPLICATION FILING REQUIREMENTS</b>			
<b>Requirement</b>	<b>Authority</b>	<b>Appendix</b>	<b>PEA</b>
Governmental Agency Consultations	G.O. 131-D, IX.A.1.g		Appendix K

**NOTICE OF APPLICATION - AMENDED**

**NOTICE OF AMENDED APPLICATION FOR A  
CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY**

**COOLWATER-LUGO TRANSMISSION PROJECT**

**Filing Date: April 25, 2014**

**Proposed Project:** Southern California Edison Company (SCE) has filed an amended application with the California Public Utilities Commission (CPUC) to construct the Coolwater-Lugo Transmission Project (Proposed Project). (A.13-08-023)

**Project Description:** The Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas have been identified to be rich solar and wind resource areas in the State of California. One of the major existing bottlenecks that would preclude the transfer of energy produced from renewable resources accumulating at Kramer Substation, located in Kramer Junction, to Lugo Substation, located in Hesperia, is referred to as the Kramer-Lugo transmission corridor. The purpose of the Proposed Project is to provide additional transmission capacity needed in the Kramer Junction and Lucerne Valley areas to support large-scale renewable generation development, system reliability, and future load serving in the Town of Apple Valley.

The Proposed Project includes the following elements (please refer to the enclosed map below):

- Construction of a new 500/220/115/12 kilovolt (“kV”) substation (“Proposed Desert View Substation”) west of Lucerne Valley and southeast of the Town of Apple Valley adjacent to SCE’s existing transmission right-of-way.
- Construction of a 220 kV transmission line approximately 34 miles long in new right-of way (“ROW”) located between the existing Coolwater Generating Station 220 kV Switchyard (“Coolwater Switchyard”) and the location of the future Jasper Substation, southwest of the intersection of Haynes Road and State Route 247.
- Replacement of a 220 kV transmission line with a higher capacity 220 kV transmission line, approximately 13.6 miles long, in existing SCE transmission ROW located from southwest of the intersection of Haynes Road and SR-247 to the Proposed Desert View Substation.
- Replacement of two 220 kV transmission lines with a 500 kV rated transmission line, initially energized at 220 kV, approximately 16.6 miles long, from the Proposed Desert View Substation to the existing Lugo Substation.
- Construction of new telecommunication facilities to connect the Proposed Desert View Substation to existing Apple Valley Substation in Apple Valley. Portions of this cable would be strung on existing overhead poles, and on new overhead structures and newly constructed underground conduit system(s). This route would be approximately 11 miles in length.
- Construction of new telecommunication facilities to connect the existing Gale Substation near Daggett to existing Pisgah Substation approximately 40 miles east of Daggett. This route would be constructed on existing overhead pole, and portions would be constructed in newly constructed underground conduit systems. This route would be approximately 29 miles in length.

Construction is scheduled to begin in the 1st quarter of 2016, and the Proposed Project is planned to be operational by April 2018.

**Electric and Magnetic Fields (EMF) Compliance:** The CPUC requires utilities to employ “no-cost” and “low-cost” measures to reduce public exposure to magnetic fields. In accordance with “EMF Design Guidelines” (Decisions 93-11-013 and 06-01-042.), the Proposed Project would implement a combination of the following measures:

1. Place new substation electrical equipment (such as transformers, capacitors, and switchracks) away from the substation property lines.
2. Utilize taller structures.
3. Utilize increased ground clearance.
4. Utilize double-circuit construction that reduces spacing between circuits as compared with single-circuit construction.
5. Arrange conductors of proposed power line(s) for magnetic field reduction.
6. Locate new substation close to existing power lines to the extent possible.

**Environmental Review:** SCE has prepared a Proponent’s Environmental Assessment (PEA) of potential environmental impacts created by the construction and operation of the Proposed Project. The PEA concludes that with the implementation of Applicant-Proposed Measures (APMs), the majority of the potential significant environmental effects associated with the Proposed Project would be reduced to less than significant levels. However, impacts to Air Quality and Aesthetics are expected to be significant and unavoidable.

Pursuant to the California Environmental Quality Act (CEQA), the CPUC’s Energy Division will conduct an independent review of the proposed project’s environmental impacts. Depending on the results of its review, the Energy Division will issue a Negative Declaration that the proposed project will not result in any significant environmental impacts, or an

environmental impact report (EIR) identifying the significant environmental impacts and mitigation measures and alternatives to avoid or reduce them.

**Public Participation:**

- The public may participate in the environmental review by submitting comments on the Notice of Intent to Approve a Negative Declaration, or on the Notice of Preparation of EIR and draft EIR, and by participating in any scoping meetings or public meetings that may be conducted. For information on the environmental review, contact the CPUC's Energy division at [enviroteam@cpuc.ca.gov](mailto:enviroteam@cpuc.ca.gov) or (415)703-2126.
- Persons wishing to present testimony in evidentiary hearings and/or legal briefing on all other issues, including project need and cost, EMF compliance; and, if one is prepared, whether the EIR complies with CEQA, require party status. Persons may obtain party status by filing a protest to the application by **May 27, 2014**, in compliance with Rule 2.6, or by making a motion for party status at any time in compliance with Rule 1.4, of the CPUC's Rules of Practice and Procedure (posted at [www.cpuc.ca.gov](http://www.cpuc.ca.gov)).
- The public may communicate their views regarding the application by writing to the CPUC at 505 Van Ness Avenue, San Francisco, CA 94102, or by emailing the Public Advisor at [public.advisor@cpuc.ca.gov](mailto:public.advisor@cpuc.ca.gov). In addition, the CPUC may, at its discretion, hold a public participation hearing in order to take oral public comment.

**Document Subscription Service:** The CPUC's free online subscription service sends subscribers an email notification when any document meeting their subscription criteria is published on the CPUC's website, such as documents filed in a CPUC proceeding (e.g., notices of hearings, rulings, briefs and decisions). To sign up to receive notification of documents filed in this proceeding (or other CPUC matters), visit [www.cpuc.ca.gov/subscription](http://www.cpuc.ca.gov/subscription).

**Contacts:** For assistance from the CPUC, please contact the Public Advisor in San Francisco at (415)703-2074 ([public.advisor@cpuc.ca.gov](mailto:public.advisor@cpuc.ca.gov)) or in Los Angeles at (213)567-7055 ([Public.Advisor.LA@cpuc.ca.gov](mailto:Public.Advisor.LA@cpuc.ca.gov)).

To review a copy of SCE's application, or to request further information about the proposed project, please contact:

**AMENDED PEA EXECUTIVE SUMMARY AND CHAPTER 1  
PURPOSE AND NEED**

## EXECUTIVE SUMMARY

### ES.1 Purpose and Need of the Proposed Project

As part of the Renewable Energy Transmission Initiative (“RETI”)<sup>1</sup>, the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas, significant portions of which are under Bureau of Land Management (“BLM”) jurisdiction, have been identified to be rich solar and wind resource areas in the State of California. In addition, the Desert Renewable Energy Conservation Plan (“DRECP”)<sup>2</sup> has also identified large amounts of renewable generation potential in the Mojave Desert area<sup>3</sup>. Existing generation in these areas, together with most of the identified future generation potential in the RETI competitive renewable energy zones and a significant portion of the generation potential in the DRECP development focus areas, would ultimately flow into Kramer Substation in Kramer Junction, CA and would then need to be exported to the south to serve customer demand in the Los Angeles basin.

~~The proposed construction and upgrade of transmission and substation facilities would be required to deliver the power produced in these areas to utility load centers.~~ The purpose of the proposed Coolwater-Lugo Transmission Project (“Coolwater-Lugo”), planned to be operational by 2018, is to provide additional transmission capacity to help alleviate the 220 kilovolt (“kV”) transmission bottlenecks between the existing Kramer and Lugo Substations and between the Lucerne Valley area and Lugo Substation, to facilitate the interconnection of renewable generation projects, to accommodate future load serving in the High Desert Region, particularly in the Town of Apple Valley, and to facilitate additional system reliability. Specifically, Coolwater-Lugo would ensure the deliverability of the Commercial Interest Portfolio’s 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan.<sup>4</sup> Under minimum load conditions, the amount of incremental generation output that could be accommodated by Coolwater-Lugo would be limited to approximately 500 MW<sup>5</sup>, due to incremental congestion on the existing Lugo No.1AA and No.2AA 500/220 kV transformer banks resulting from lower load demand. The capacity of Coolwater-Lugo and its continued ability to relieve transmission constraints in the Kramer-Lugo and Lugo-Pisgah Corridors will be tied to load growth, 3<sup>rd</sup> party

---

<sup>1</sup> <http://www.energy.ca.gov/reti/>

<sup>2</sup> <http://www.drecp.org/>

<sup>3</sup> [http://www.drecp.org/meetings/2012-04-25-26\\_meeting/background/Transmission\\_Planning/Transmission\\_Technical\\_Group\\_report\\_final\\_4\\_16\\_12.pdf](http://www.drecp.org/meetings/2012-04-25-26_meeting/background/Transmission_Planning/Transmission_Technical_Group_report_final_4_16_12.pdf)

<sup>4</sup> <http://www.aiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf> (p. 155)

<sup>5</sup> Without installation of a Lugo No.3AA 500/220 kV transformer bank, the capacity of Coolwater-Lugo would be dictated by the remaining capacity of the existing Lugo No.1AA & No.2AA 500/220 kV transformer banks which have an anticipated remaining capacity of approximately 500 MW in the year 2018 under minimum load conditions.

generation projects pursuing development in the Kramer and Lucerne Valley areas, and the specific point of interconnections (POI) of those 3<sup>rd</sup> party generation projects.

The proposed Coolwater-Lugo scope would consist of installing new transmission lines, new substation facilities to support line termination, and telecommunication facilities to support line protection and the use of a Special Protection System (“SPS”)<sup>1</sup>. The transmission line would utilize a combination of single-circuit and double-circuit structures consisting of 220 kV and 500 kV design standards between the existing Coolwater Generation Station 220 kV Switchyard (“Coolwater Switchyard”) and the existing CAISO-controlled Lugo Substation, in order to provide an additional path for power to flow from Kramer Substation ultimately to Lugo Substation. Routing of the transmission line south from Coolwater Switchyard through the Lucerne Valley area to Southern California Edison’s (“SCE”) existing transmission ROW, would facilitate future connection to SCE proposed Jasper Substation, which is a separate project that is being developed approximately 22 miles south of Coolwater Switchyard and 27 miles northeast of Lugo Substation. ~~In addition, a new 500/220 kV transformer bank would be installed at Lugo Substation and~~ A new Desert View Substation with ultimate design for 500/220/115/12 kV, would be sited and partially constructed approximately 16 miles northeast of Lugo Substation along the proposed transmission line route as part of Coolwater-Lugo in order to consolidate three transmission lines, the new Coolwater-Desert View 220 kV line, and the existing Lugo-Pisgah 220kV #1 and Lugo Pisgah 220kV #2 lines into the existing SCE ROW

As discussed below, and further discussed in Section 1.1 *Project Purpose*, the purpose of the proposed Coolwater-Lugo is to:

1. Facilitate achievement of the state-mandated Renewables Portfolio Standard (“RPS”) (i.e., 33% renewable by year 2020 per Senate Bill 2 (SBX1 2) in an orderly, rational and cost-effective manner, while also considering the need for maintaining reliable electric service during the upgrade and/or construction of new facilities;
2. Integrate planned renewable generation projects in the Kramer and Lucerne Valley areas and provide for the full delivery of a ~~250~~ 275 MW renewable generation project, known as the Mojave Solar Project, in a manner which minimizes potential environmental impacts. Currently the ~~250~~ 275 MW renewable generation project is under construction by Abengoa Solar, Inc. (Abengoa), the interconnection customer, who has executed a Power Purchase Agreement (“PPA”) pursuant to California Public Utilities Commission

---

<sup>1</sup> As defined by the North American Electric Reliability Corporation (NERC), a SPS is an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and MVAR), or system configuration to maintain system stability, acceptable voltage, or power flows.

(“CPUC”) tariff. Abengoa is seeking interconnection via the California Independent System Operator (“CAISO”) Interconnection Process;<sup>1</sup>

3. Interconnect and ~~deliver energy from up to 1,000 MW~~ ensure the deliverability of the Commercial Interest Portfolio’s 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan<sup>2</sup> in a way that complies with all applicable CAISO, North American Electric Reliability Corporation (“NERC”), and Western Electric Coordinating Council (“WECC”) reliability planning criteria, and in a manner that minimizes transmission line crossings;
4. Support the State of California Greenhouse Gas (“GHG”) Reduction Program;
5. Assist the BLM in meeting the Federal Renewable Energy Mandate to develop 10,000 MW of renewable generation on public lands by 2015;<sup>3</sup>
6. Support SCE’s California Renewable Energy Small Tariff (“CREST”), Renewable Market Adjusting Tariff (Re-MAT), and SCE’s Rule 21 Projects. By expanding transmission capacity south of Kramer, the Coolwater-Lugo would allow an increased number of SCE retail customers to export to the grid power produced from eligible small-scale renewable energy facilities under CREST, Re-MAT, and Rule 21;
7. Support military desire to serve its own load under Rule 21. The Coolwater-Lugo would allow the military facilities in the Kramer Junction and Ridgecrest areas to develop and serve their own load to meet national security goals;
8. Address the City of Ridgecrest’s renewable energy integration concerns by reducing the existing Kramer-Lugo transmission bottleneck and thus allowing increased development of renewable energy projects in the Ridgecrest area, including Rule 21 projects and projects on military facilities;
9. Facilitate serving future load in the High Desert Region which includes the Town of Apple Valley. As load continues to grow in the High Desert Region, Victor Substation will reach its load serving limits thereby requiring a new major load-serving substation;

<sup>1</sup> Abengoa, CAISO, and SCE executed a Large Generation Interconnection Agreement (“LGIA”) for SCE to construct the Coolwater-Lugo 220 kV transmission line in order to provide the Mojave Solar Project full capacity deliverability. The FERC on January 28, 2011 accepted the LGIA with an effective date of January 30, 2011. FERC Docket Nos. ER11-2204-000 and ER11-2368-000.

<sup>2</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf> (p. 155)

<sup>3</sup> Executive Order 13212, Actions to Expedite Energy-Related Projects, requires federal agencies to expedite review of energy project applications; and the Energy Policy Act of 2005 (Title II, Sec. 211) requires the Department of Interior (“DOI”) to approve at least 10,000 MW of renewable energy on public lands by 2015.

10. Facilitate reliability improvements in the Lugo-Pisgah Transmission Corridor, at Coolwater 220 kV Substation, and at Lugo Substation. Currently, eight 500 kV transmission lines terminate at Lugo Substation. By developing Coolwater-Lugo, including the Desert View Substation and corresponding telecommunication upgrades, line protection would be upgraded in the Lugo-Pisgah Transmission Corridor, 220 kV switchrack upgrades would occur at Coolwater 220 kV Substation, and future transmission lines could be delooped out of Lugo Substation could be delooped in the future and looped into Desert View Substation thereby improving overall system reliability; and,
11. Meet project purpose and objectives while minimizing potential environmental effects of Coolwater-Lugo. Specific approaches to minimizing potential environmental effects include:
  - a) Maximizing the use of existing, previously disturbed transmission corridors to minimize potential effects on previously undisturbed land and resources;
  - b) Selecting site, route, and structure locations with the lowest potential for environmental impacts while still meeting project objectives; and,
  - c) Selecting a route that minimizes potential environmental impacts and project costs.

One of the major existing bottlenecks that would preclude the transfer of energy produced from renewable resources accumulating at Kramer Substation, is referred to as the Kramer-Lugo transmission corridor. This corridor consists of two 220 kilovolt (“kV”) and two 115 kV transmission lines with limited transfer capability due to existing facility limitations. Specifically, the Kramer-Lugo No.1 and No.2 220 kV transmission lines are currently at thermal capacity under peak system conditions, cannot be upgraded, and have become a transmission bottleneck. A second existing bottleneck that would also preclude the transfer of energy from future renewable resources developing in the Lucerne Valley area, near SCE’s future Jasper Substation, is referred to as the Lugo-Pisgah transmission corridor. Figure ES.1-A depicts a block diagram of the major transmission facilities associated with these two corridors.

On August 22, 2006, Mojave Solar LLC applied to the CAISO for interconnection of the proposed Mojave Solar Project pursuant to Section 3.5 of the Larger Generator Interconnection Procedures issued under the CAISO Tariff. The Queue #125 Mojave Solar Project is a solar thermal generating facility, currently being constructed in Hinkley California, which will interconnect into SCE's Sandlot<sup>1</sup> Substation and ultimately inject 275<sup>2</sup> MW into Kramer Substation and exceed the remaining Kramer-Lugo transmission corridor capacity.

## **ES.2 Project Objectives**

The California Environmental Quality Act ("CEQA") (Pub. Res. Code § 21000, et seq.) and Section 15126.6 (a) of the CEQA Guidelines<sup>3</sup> require the consideration of a reasonable range of alternatives to a proposed project, or the location of a proposed project, that would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project. Section 15126.6 (a) of the CEQA Guidelines also requires that the comparative merits of the alternatives be evaluated. In order to develop a reasonable range of alternatives, Section 15124(b) of the CEQA Guidelines requires that a clearly written statement of objectives be prepared for a proposed project that demonstrates the objectives sought to be achieved by the project and includes the underlying purpose of the project. The range of potential alternatives selected for evaluation shall "include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects."<sup>4</sup> In addition to the purposes described above and in Section 1.1, SCE has identified the following objectives for meeting Coolwater-Lugo's purpose and need described in this chapter:

1. Facilitate SCE and other California utilities ~~achievement of~~ achieving and maintaining California's Renewable Portfolio Standards in an expedited manner;
2. Provide transmission facilities identified as necessary for the full delivery of a ~~250~~ 275-megawatt renewable generation project located in the Barstow area, and future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas;
3. Comply with all applicable reliability planning criteria required by the California Independent System Operator, the North American Electric Reliability Corporation, and the Western Electric Coordinating Council;
4. Support California's GHG Reduction Program;

<sup>1</sup> [www.sce.com/sandlot](http://www.sce.com/sandlot)

<sup>2</sup> The Abengoa Mojave Solar Project consists of a 250 MW interconnection request (Q125) and an incremental 25 MW request (Q909), for a total of 275 MW.

<sup>3</sup> See Cal. Code Regs., tit. 14, §15000, et seq.

<sup>4</sup> Cal. Code Regs., tit. 14, §15126.6(c).

5. Support ~~Bureau of Land Management~~ (“BLM”) compliance with the Federal Renewable Energy Mandate;
6. Provide transmission facilities in a timely manner that would facilitate the interconnection of eligible small-scale renewable energy facilities ~~California Renewable Energy Small Tariff~~ under SCE’s CREST, Re-MAT, and Rule 21 tariffs ~~projects~~;
7. Provide transmission facilities that facilitate the Department of Defense meeting their Energy Mandate of producing or procuring 25 percent of their total energy from renewable energy sources beginning in 2025 as outlined under the National Defense Authorization Act of 2010;<sup>1</sup>
8. Address transmission capacity concerns from the City of Ridgecrest;
9. License a new multipurpose 500/220/115/12 ~~kilovolt~~ (“kV”) Desert View Substation southeast of the Town of Apple Valley to facilitate load serving, reliability, and future generation interconnections;<sup>2</sup>
10. Construct facilities in an orderly, rational, and cost-effective manner to maintain reliable electric service and by minimizing service interruptions during construction;
11. Minimize potential environmental impacts through selection of transmission routes and substation site locations, including maximizing the use of existing transmission corridors in order to minimize potential effects on previously undisturbed land and resources<sup>3</sup>, and where existing right-of-ways (“ROWs”) are not available, utilize the shortest route that minimizes potential environmental impacts;
12. Meet project needs in a cost-effective and timely manner; and,

---

<sup>1</sup> See [http://www.govenergy.com/2010/Files/Presentations/Renewables/2010\\_GovEnergy\\_Tindal.pdf](http://www.govenergy.com/2010/Files/Presentations/Renewables/2010_GovEnergy_Tindal.pdf)

<sup>2</sup> The proposed Desert View Substation would be initially constructed with only the facilities needed to support the transmission line from Coolwater to Lugo. Similar to SCE’s Antelope Substation and Windhub Substation, SCE is seeking to license the full build out of Desert View Substation, which would include 500/220/115/12 kV facilities needed for anticipated load serving in the High Desert Region, particularly the Town of Apple Valley, additional reliability, and future generation interconnections.

<sup>3</sup> See Garamendi Principles (Senate Bill 2431, Stats. 1988, Ch. 1457) regarding State transmission siting policies, including; 1) encourage the use of existing rights-of-way by upgrading existing transmission facilities where technically and economically justifiable; 2) when construction of new transmission lines is required, encourage expansion of existing right-of-way, when technically and economically feasible; 3) provide for the creation of new rights-of-way when justified by environmental, technical, or economic reasons as determined by the appropriate licensing agency; 4) where there is a need to construct additional transmission capacity seek agreement among all interested utilities on the efficient use of that capacity.

13. Design and construct the Project in conformance with SCE's current engineering, design, and construction standards for substation, transmission, subtransmission, and distribution system projects.

### **ES.3 Summary of Proposed Project**

To provide additional south of Kramer capacity to integrate current and future renewable generation projects, SCE needs to develop new and upgraded transmission facilities. These new and upgraded transmission facilities would eliminate the bottlenecks that would preclude renewable generation resources from reaching the utility load centers. To this end, SCE is required to develop and maintain a reliable transmission network with adequate capacity. The facilities needed to deliver the electrical power from the new planned generation resources located in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, and Owens Valley areas have been identified through generation interconnection studies performed as mandated by the CAISO. The major components of these facilities are summarized below with complete descriptions provided in Chapter 3, *Project Description*.

#### Substations

- Reconfigure Coolwater 220 kV Switchyard
- Terminate new Coolwater-Desert View 220 kV Transmission Line at the Coolwater and Desert View 220 kV buses
- Install new relay buildings and necessary equipment to support the SPS at Coolwater 220 kV Switchyard
- ~~▪ Expand the Lugo 500 kV Switchrack to the south five positions~~
- ~~▪ Relocate two existing 500 kV transmission line terminations at Lugo Substation~~
- Terminate new Desert View-Lugo 220 kV Transmission Line at the Desert View and Lugo 220 kV buses
- ~~▪ Install one 500/220 kV transformer bank at Lugo Substation~~
- ~~▪ Construct new relay building and install bank protection relays at Lugo Substation~~
- Install new protection, control, and SPS at Lugo Substation
- License proposed Desert View 500/220/115/12 kV Substation and initially construct the facilities necessary to loop the Coolwater-Lugo 220 kV Transmission Line and the Lugo-Pisgah No.1 & No.2 220 kV Transmission Lines into Desert View Substation including new protection, control, and SPS at Desert View Substation.

## Transmission and Telecommunication

- Remove approximately 29.1 miles of the existing Lugo-Pisgah No.1 220 kV Transmission Line from Lugo Substation northeast to approximately the intersection of Haynes Road and State Route 247 (“SR-247”)
- Remove approximately 16.0 miles of the existing Lugo-Pisgah No.2 220 kV Transmission Line from Lugo Substation northeast to proposed Desert View Substation and terminate the remaining portion of this line into the proposed Desert View Substation
- Construct 16.6 miles of 500 kV single-circuit transmission line (utilizing 2B-2156 ACSR conductor, replacing the two existing Lugo-Pisgah No.1 and No.2 220 kV Transmission lines, initially operated at 220 kV) from Lugo Substation to the proposed Desert View Substation and 13.6 miles of 220 kV double-circuit transmission line in existing ROW from proposed Desert View Substation to approximately the intersection of Haynes Road and SR-247
- Construct approximately 34.0 miles of 220 kV double-circuit transmission line from Coolwater 220 kV Switchyard south to the existing Lugo-Pisgah transmission corridor, located approximately near the intersection of Haynes Road and SR-247
- Install a new 150-foot tall microwave tower and foundation at the existing Coolwater 220 kV Switchyard
- Install lightwave transponder equipment or optical amplifier and channel bank equipment at Coolwater Switchyard, Lugo Substation, and the proposed Desert View Substation
- Install approximately 11.0 miles of Fiber-Optic Cable from existing Apple Valley Substation to the proposed Desert View Substation
- Install approximately 29.0 miles of Fiber-Optic Cable from existing Pisgah Substation near Ludlow to the existing Gale Substation near Daggett

## **ES.4 Alternatives to the Proposed Project**

### **ES.4.1 Overview**

Alternatives to the Proposed Project were developed and evaluated based on the Project objectives, purpose, and need. As summarized in Section ES.2, the purpose of the proposed Coolwater-Lugo Transmission Project is to help alleviate the 220 kV transmission bottleneck between the existing Kramer and Lugo Substations, to facilitate the interconnection of renewable generation projects, to accommodate future load serving in the High Desert Region, particularly in the Town of Apple Valley, and to facilitate additional system reliability.

#### ES.4.2 System Alternatives

System alternatives considered and eliminated include: (1) Constructing a Coolwater-Pisgah 220 kV Transmission Line; (2) Rebuilding the Existing Kramer-Lugo 220 kV Transmission Lines; (3) Reconductoring the Existing Kramer-Lugo 220 kV Transmission Lines; (4) Constructing a Kramer-Lugo No.3 220 kV Transmission Line; (5) Constructing a Kramer-Llano 500 kV Transmission Line; (6) Constructing a Kramer-Llano 500 kV Transmission Line and rebuilding of the Lugo-Pisgah No.1 220 kV Transmission Line; (7) The AV Clearview Transmission Proposal – Baseline Case (non-SCE sponsored project); (8) AV Clearview Transmission Proposal – Expanded Case (non-SCE sponsored project); and, (9) No project alternative. System alternatives were eliminated from further consideration (refer to Chapter 1, *Purpose & Need*, Section 1.4 for detailed information).

#### ES.4.3 Transmission Route & Substation Site Alternatives

Transmission line route alternatives considered include: (Route Alternative A) Exiting the west side of Coolwater Switchyard and continuing south across Interstate 40 (“I-40”) and paralleling the Los Angeles Department of Water and Power transmission corridor to the Lucerne Valley Cutoff, following the Lucerne Valley Cutoff in new ROW to ~~State Route 247~~ (“SR-247”), following SR-247 south to an existing SCE transmission ROW, using the existing SCE transmission ROW southwest to the proposed Desert View Substation, and continuing southwest in the existing ROW to SCE’s existing Lugo Substation; (Route Alternative B with Segment 9) same as Route Alternative A, except south of I-40 paralleling an existing SCE 115 kV subtransmission line west across the Marine Corps Logistics Base (“MCLB”) Barstow to SR-247, continuing southwest in new ROW adjacent to existing dirt OHV access roads to Lucerne Valley Cutoff, same as Route Alternative A along Lucerne Valley Cutoff to SR-247, then continuing in new ROW along base of Granite Mountains to existing SCE transmission ROW, same as Route Alternative A in existing ROW to the alternative Desert View Substation site, continuing in new ROW south from Desert View to an existing SCE 500 kV transmission corridor, then paralleling the existing corridor to Lugo Substation; and (Route Alternative B with Segment 10) same as Route Alternative B with Segment 9, with only difference being an alternative segment around the MCLB Barstow on the south side in new ROW west to SR-247.

Substation site alternatives considered include: (Site Alternative 1) The enclosed area of the Proposed Desert View Substation would encompass approximately 86.0 acres located in unincorporated San Bernardino County, to the southeast of the Town of Apple Valley and west of Lucerne Valley. The dimensions of the substation would be approximately 2,200 feet by 1,700 feet. The proposed substation site is vacant desert land containing no improvements. Potential utilities available in the area may include electrical, gas, water, and telecommunications; and (Site Alternative 2) The enclosed area of the substation would encompass approximately 82.0 acres located in unincorporated San Bernardino County, to the southeast of the Town of Apple Valley and west of Lucerne Valley. The dimensions of the substation would be approximately 2,090 feet by 1,700 feet.

The alternative substation site is vacant desert land containing a single-family residential home in the southeast corner of the site, which would be demolished prior to construction activities. In addition there are storage containers on the northwest corner of the substation site and in the center of the site, which would need to be removed.

#### **ES.4.4 Proposed Project**

Transmission Line Route Alternative A and Substation Site Alternative 1 are carried forward as the Proposed Project in this document. Route A was selected because it maximizes the use of existing transmission ROW, is shorter in length, minimizes impacts to off-highway vehicle recreation areas, and avoids the Bendire's Thrasher and Juniper Flats Areas of Critical Environmental Concern. Substation Site 1 was selected because is located entirely on vacant land and is closer to the existing transmission corridor. Transmission Line Route Alternative B with Segments 9 or 10 is paired with Substation Site Alternative 2 and carried forward as the Alternative Project.

### **ES.5 Environmental Summary**

SCE conducted an environmental impact assessment for Coolwater-Lugo. The impact assessment is discussed in Section 4, *Environmental Impact Assessment*. The assessment addressed the following environmental topics:

- Aesthetics
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural and Paleontological Resources
- Geology and Soils
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Socioeconomics, Population and Housing, and Environmental Justice
- Public Services
- Recreation

- Transportation and Traffic
- Utilities and Service Systems

Table ES.5-1 contains a summary of the impact assessment, organized by CEQA checklist impact assessment questions.

**Table ES.5-1 Impact Assessment Summary**

<b>Issues:</b>	<b>Anticipated Impact Significance</b>
<b>I. AESTHETICS: Would the project:</b>	
a) Have a substantial adverse effect on a scenic vista?	No impact
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	No impact
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	Significant impact
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	Less than significant impact
<b>II. AGRICULTURE AND FORESTRY RESOURCES: Would the project:</b>	
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	No impact
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	No impact
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	No impact
d) Result in the loss of forest land or conversion of forest land to non-forest use?	No impact
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forest land to non-forest use?	No impact
<b>III. AIR QUALITY: Would the project:</b>	
a) Conflict with or obstruct implementation of the applicable air quality plan?	No impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	Significant impact
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	Significant impact
d) Expose sensitive receptors to substantial pollutant concentrations?	Less than significant impact
e) Create objectionable odors affecting a substantial number of people?	Less than significant impact
<b>IV. BIOLOGICAL RESOURCES: Would the project:</b>	
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Less than significant impact with incorporation of APMs
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Less than significant impact with incorporation of APMs
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	No impact
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less than significant impact
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	Less than significant impact
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	Less than significant impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
<b>V. CULTURAL RESOURCES:</b> Would the project:	
Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?	Less than significant impact with incorporation of APMs
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	Less than significant impact with incorporation of APMs
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Less than significant impact with incorporation of APMs
d) Disturb any human remains, including those interred outside of formal cemeteries?	Less than significant impact with incorporation of APMs
<b>VI. GEOLOGY AND SOILS:</b> Would the project?	
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	Less than significant impact
ii) Strong seismic ground shaking?	Less than significant impact
iii) Seismic-related ground failure, including liquefaction?	Less than significant impact
iv) Landslides?	Less than significant impact
b) Result in substantial soil erosion or the loss of topsoil?	Less than significant impact
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	Less than significant impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	Less than significant impact
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	Less than significant impact
<b>VII. GREENHOUSE GAS EMISSIONS: Would the project?</b>	
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Less than significant impact
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Less than significant impact
<b>VIII. HAZARDS AND HAZARDOUS MATERIALS: Would the project:</b>	
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Less than significant impact
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Less than significant impact
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	No impact
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	No impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	Less than significant impact
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	Less than significant impact
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Less than significant impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	Less than significant impact
<b>IX. HYDROLOGY AND WATER QUALITY: Would the project:</b>	
a) Violate any water quality standards or waste discharge requirements?	Less than significant impact
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	Less than significant impact
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in a substantial erosion or siltation on- or off-site?	Less than significant impact
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	Less than significant impact
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	Less than significant impact
f) Otherwise substantially degrade water quality?	Less than significant impact
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	No impact
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	Less than significant impact
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	Less than significant impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
j) Inundation by seiche, tsunami, or mudflow?	Less than significant impact
<b>X. LAND USE AND PLANNING:</b> Would the project:	
a) Physically divide an established community?	No impact
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	No impact
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	No impact
<b>XI. MINERAL RESOURCES:</b> Would the project:	
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	No impact
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	No impact
<b>XII. NOISE:</b> Would the project result in:	
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Less than significant impact
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	Less than significant impact
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	Less than significant impact
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	Less than significant impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	Less than significant impact
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	Less than significant impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
<b>XIII. POPULATION AND HOUSING:</b> Would the project:	
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Less than significant impact
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	Less than significant impact
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	Less than significant impact
<b>XIV. PUBLIC SERVICES:</b> Would the project:	
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: Fire protection, police protection, schools, parks, or other public facilities?	Less than significant impact
<b>XV. RECREATION:</b>	
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Less than significant impact
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	No impact

Table ES.5-1 Impact Assessment Summary

Issues:	Anticipated Impact Significance
<b>XVI. TRANSPORTATION/TRAFFIC: Would the project:</b>	
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including by not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	Less than significant impact
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	No impact
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	Less than significant impact
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g. farm equipment)?	Less than significant impact
e) Result in inadequate emergency access?	Less than significant impact
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	Less than significant impact
<b>XVII. UTILITIES AND SERVICE SYSTEMS: Would the project:</b>	
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	Less than significant impact
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	No impact
c) Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	Less than significant impact

**Table ES.5-1 Impact Assessment Summary**

<b>Issues:</b>	<b>Anticipated Impact Significance</b>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	Less than significant impact
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments?	Less than significant impact
f) Be served by a landfill with sufficient permitted capacity to accommodate the project’s solid waste disposal needs?	Less than significant impact
g) Comply with federal, state, and local statutes and regulations related to solid waste?	No impact

The CEQA Guidelines (Section 15126.2) requires a discussion of the overall significance of the environmental impacts of the Proposed Project. These potential significant environmental impacts are summarized in Table ES.5-2, *Potential Significant Environmental Impacts*. With the implementation of applicant proposed measures (“APMs”), the majority of the potential significant environmental impacts associated with the Proposed Project would be reduced to less than significant levels. However, impacts to aesthetics and air quality would remain significant and unavoidable. Proposed APMs are shown on Table ES.5-3.

Table ES.5-2 Potentially Significant Environmental Impacts

Resource	Description	Direct/Indirect	Short term/Long term
Aesthetics			
Visual Character and Visual Quality of the Project at Key Observation Point (“KOP”) 6 and KOP 9	Construction activities could impact the existing visual character and quality at KOP 6 and KOP 9 for viewers from the road.	Direct	Short term: Construction activities associated with Proposed Transmission Line Segments 2 and 3 would impact the existing visual character and visual quality at KOP 6 and KOP 9 for viewers from the road. The impact would be considered significant and unavoidable.
Air Quality			
Air Quality	Construction emissions of NO <sub>x</sub> , PM <sub>10</sub> , and PM <sub>2.5</sub> would exceed the Mojave Desert Air Quality Management District’s (MDAQMD) significance thresholds.	Direct	Short term: SCE would comply with applicable regulations; APM AIR-1 and AIR-2 would reduce regional air quality impacts, The impact would remain significant and unavoidable.

Table ES.5-2 Potentially Significant Environmental Impacts

Resource	Description	Direct/Indirect	Short term/Long term
Biological Resources			
Special Status Plant Populations	Construction activities could impact special status plants known to occur or observed within the Project Area.	Direct	Short term: Impacts to special-status plants would be less than significant with implementation of APM BIO-1 through APM BIO-3.
Special Status Wildlife	Construction activities could impact special status wildlife species known to occur or observed within the Project Area.	Direct	Short term: Impacts to special-status wildlife would be less than significant with implementation of APM BIO-1 through APM BIO-11.
Nesting Birds/Raptors	Construction activities could impact suitable nesting birds/raptors habitat due to noise and vibration.	Direct	Short term: Impacts to nesting birds/raptor habitat would be less than significant with implementation of APM BIO-1 through APM BIO-4.
Burrowing Owl	Construction activities could impact suitable foraging and breeding habitat for burrowing owls.	Direct	Short term: Impacts to burrowing owl habitat would be less than significant with implementation of APM BIO-1 through APM BIO-3, and APM BIO-5.

Table ES.5-2 Potentially Significant Environmental Impacts

<b>Resource</b>	<b>Description</b>	<b>Direct/Indirect</b>	<b>Short term/Long term</b>
Desert Tortoise	Construction activities could impact desert tortoise burrows or cause direct injury due to animal's slow rate of movement.	Direct	Short term: Impacts to desert tortoise would be less than significant with implementation of APM BIO-6 through APM BIO-10.
Arroyo Toad	Construction activities could impact suitable arroyo toad habitat.	Direct and Indirect	Short term: Impacts to arroyo toad would be less than significant with implementation of APM BIO-1 through APM BIO-3.
Mohave Ground Squirrel	Construction activities could impact suitable Mohave ground squirrel habitat.	Direct	Short term: Impacts to Mohave ground squirrel would be less than significant with implementation of APM BIO-1 through APM BIO-3, and APM BIO-11.
Coast Horned Lizard and Mojave fringe-toed lizard	Construction activities could impact suitable Coast Horned Lizard and Mojave fringe-toed lizard habitat.	Direct	Short term: Impacts to Coast Horned Lizard and Mojave fringe-toed lizard would be less than significant with implementation of APM BIO-1 through APM BIO-3.

Table ES.5-2 Potentially Significant Environmental Impacts

Resource	Description	Direct/Indirect	Short term/Long term
Cultural Resources			
Cultural Resources	Construction activities could impact significant cultural resources (those found eligible for listing in the NRHP or CRHR).	Direct	Short term: Impacts to cultural resources would be less than significant with implementation of APM CUL-1 and CUL-2.
Paleontological Resources	Construction activities could impact scientifically valuable fossils and other paleontologically important resources.	Direct	Short term: Impacts to paleontological resources would be less than significant with implementation of APM PAL-1.

Table ES.5-3 Applicant Proposed Measures

APM ID	APM Language
AIR-1 (Air Quality)	<p>SCE would prepare an Exhaust Emissions Control Plan to establish a target goal of a project wide fleet average reduction of 20 percent NOx compared to the estimated unmitigated emissions as presented in the PEA for applicable diesel-fueled off-road construction equipment of more than 50 horsepower.</p> <p>Acceptable options for reducing emissions could include, but are not limited to: the use of newer model engines meeting USEPA Tier 3 standards if available (or better), low emissions diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other similar available options.</p>
AIR-2 (Air Quality)	<p>SCE would prepare a Fugitive Dust Control Plan to reduce fugitive dust emissions (fugitive PM<sub>10</sub> and PM<sub>2.5</sub>). Acceptable control measures for reducing emissions described within the Fugitive Dust Control Plan may include, but are not limited to: limit traffic speeds on unpaved roads to 15 mph; apply water as needed to comply with MDAQMD Rule 403 requirements or soil stabilizers (e.g., gravel for substation area) on active unpaved access roads, the substation area, and staging areas if construction activity causes persistent visible emissions of fugitive dust beyond the work area; apply soil stabilizers</p>

Table ES.5-3 Applicant Proposed Measures

APM ID	APM Language
	<p>to inactive construction areas as described in the SWPPP; where applicable, install gravel, shaker plates, or other BMPs to minimize transport of dirt onto public paved surfaces.</p> <p>The Fugitive Dust Control Plan would describe how the measures would be implemented and monitored during Project construction. Furthermore, as construction details become available, the Fugitive Dust Control Plan would include site-specific mitigation measures for Project areas that could be more likely to generate dust near sensitive receptors.</p>
BIO-1 (Biological Resources)	<p>Prior to starting construction, a draft Project Revegetation Plan would be prepared to restore areas where native vegetation is disturbed during construction. Prior to completing construction, the Project Revegetation Plan would be finalized to address site-specific conditions, restoration methodology and technique, implementation schedule, monitoring and maintenance, and success criteria.</p>
BIO-2 (Biological Resources)	<p>Other than as described in species-specific APMs, biologists would monitor construction activities in wildlife habitat areas where special-status species or unique resources (defined by regulations and local conservation plans) are known to occur.</p>
BIO-3 (Biological Resources)	<p>All project construction-related workers (SCE, SCE contractors and subcontractors) would be required to attend a Worker Environmental Awareness Program (“WEAP”). Any temporary Project site visitors would be required to attend a WEAP or be accompanied by personnel who have completed the WEAP training. The WEAP would address resource issues including desert tortoise, Mohave ground squirrel, burrowing owl, and other special-status species with a potential to occur within the Project area.</p>
BIO-4 (Biological Resources)	<p>SCE would prepare and implement a Nesting Bird Management Plan to address nesting birds undertaken in collaboration with the CDFW, USFWS, and BLM. The Plan would be an adaptive management plan that may be updated as needed improvements are identified or conditions in the field change. The Plan would include the following: nest management and avoidance, field approach (survey methodology, reporting, and monitoring), and the Project avian biologist qualifications. The avian biologist would be responsible for oversight of the avian protection activities including the biological monitors.</p> <p>In order to minimize impacts to nesting birds (common or special status), ongoing pre-construction surveys and daily sweep surveys of active construction areas by a qualified biologist would focus on breeding behavior and a search for active nests, as defined by CDFW</p>

Table ES.5-3 Applicant Proposed Measures

APM ID	APM Language
	<p>and USFWS, within 500 feet of the Proposed Project.</p> <p>At a minimum, the “Nesting Bird Management Plan” (Plan) would include the following:</p> <ul style="list-style-type: none"> <li>(a) For vegetation clearing that needs to occur during the typical nesting bird season (February 1 to August 31; as early as January 1 for raptors) qualified biologists would conduct nesting bird surveys. If an active nest were located, the appropriate avoidance and minimization measures from the management plan would be implemented. If active nest removal is required, SCE would consult with CDFW, USFWS, and BLM;</li> <li>(b) During the typical nesting bird season, SCE would conduct preconstruction clearance surveys no more than 14 days prior to construction and in accordance with the adaptive management plan, to determine the location of nesting birds and territories. Preconstruction sweeps would be conducted within 3 days before construction begins at a given project location;</li> <li>(c) Nest monitoring would be conducted by Project biological monitors with knowledge of bird behavior under the direction of a BLM and/or CDFW approved avian biologist;</li> <li>(d) Nesting deterrents (e.g. mooring balls, netting, etc.) would be used for inactive nests at the direction of the Project avian biologist;</li> <li>(e) A Project avian biologist would determine the appropriate buffer area around active nest(s) and provisions for buffer exclusion areas (e.g. highways, public access roads, etc.) along with construction activity limits. Unless restricted by the Project avian biologist, construction vehicles would be allowed to move through a buffer area with no stopping or idling. The Project avian biologist would determine, evaluate, and modify buffers as appropriate based on species tolerance and behavior, the potential disruptiveness of construction activities, and surrounding conditions; and,</li> <li>(f) The Project biological monitor would ensure implementation of appropriate buffer areas around active nest(s) during project activities. The active nest site and applicable buffer would</li> </ul>

Table ES.5-3 Applicant Proposed Measures

APM ID	APM Language
	remain in place until nesting activity concluded. Nesting bird status reports would be submitted according to the management plan.
BIO-5 (Biological Resources)	<p>A pre-construction, focused burrowing owl survey would be conducted no more than 30 days prior to commencement of ground-disturbing activities within suitable habitat to determine if any occupied burrows are present. If occupied burrows are found, adequate buffers shall be established around burrows. Adequate buffers would be determined by a Project Avian biologist based upon field conditions and resource agency guidelines for wintering burrows and breeding season burrows.</p> <p>SCE would develop a Burrowing Owl Management Plan for the Project. The Plan would include information related to construction monitoring, avoidance and minimization measures, relocation strategy, exclusionary devices, and reporting requirements.</p>
BIO-6 (Biological Resources)	Project personnel in non-desert tortoise exclusion fenced areas would be required to inspect for desert tortoises under vehicles prior to moving the vehicle. If a desert tortoise is found beneath a vehicle, it would not be moved until the desert tortoise had left of its own accord. If a vehicle must be moved in the event of an emergency, placing a tortoise in harm's way, a USFWS Authorized Biologist may move the tortoise to an appropriate location.
BIO-7 (Biological Resources)	All burrows suitable for desert tortoise found during clearance surveys within project ground disturbance areas within desert tortoise habitat, whether occupied or vacant, that would be subject to construction-related disturbance, would be excavated by a Biologist authorized by USFWS, and collapsed or blocked to prevent desert tortoise reentry.
BIO-8 (Biological Resources)	All desert tortoise handling, excavations including nests, would be conducted by a Biologist authorized by USFWS, in accordance with USFWS approved protocol in compliance with appropriate regulatory permits.
BIO-9 (Biological Resources)	Desert tortoise exclusion fencing shall be installed around material yards within suitable, occupied habitat according to USFWS recommended specifications (USFWS, 2005) and in compliance with appropriate regulatory permits.
BIO-10 (Biological Resources)	Trash and food items would be contained in closed containers during construction to discourage attracting opportunistic predators such as ravens.

Table ES.5-3 Applicant Proposed Measures

APM ID	APM Language
<p>BIO-11 (Biological Resources)</p>	<p>Before initiating ground-disturbing activities in potential Mohave ground squirrel habitat within its historic range (portions of Transmission Line Segments 5, 5a, 5b, 6, and 7, portions of the Apple Valley to Desert View Telecommunication Route, and the Proposed and Alternative Desert View Substation sites) , a Project biologist knowledgeable and experienced in the biology and natural history of Mohave ground squirrel would be designated to monitor construction activities to help avoid the take of individual animals and to minimize habitat disturbance. The CDFW would be notified in writing prior to commencement of ground-disturbing activities of the biologist’s name, business address, and telephone number. The biologist would be subject to the approval by the CDFW and would be required to follow all applicable protocols regarding Mohave ground squirrel.</p>
<p>CUL-1 (Cultural Resources)</p>	<p>Potential Project effects to Historical Resources/Historic Properties may be mitigated or reduced to a less than significant level by utilizing one, or a combination of standard-practice mitigation scenarios including, but not limited to:</p> <p style="padding-left: 40px;"><b>Prehistoric Resources:</b></p> <ul style="list-style-type: none"> <li>a. avoid (avoidance by design, preserve in place, capping);</li> <li>b. minimize (reduction of Area of Direct Impact/Effect);</li> <li>c. mitigate (data recovery).</li> </ul> <p style="padding-left: 40px;"><b>Historic Resources:</b></p> <ul style="list-style-type: none"> <li>a. avoid (avoidance by design, preserve in place, capping);</li> <li>b. minimize (reduction of Area of Direct Impact/Effect);</li> <li>c. mitigate (historic context statement, data recovery).</li> </ul> <p style="padding-left: 40px;"><b>Historic Architecture/Utility Infrastructure:</b></p> <ul style="list-style-type: none"> <li>a. avoid (avoidance by design, preserve in place);</li> <li>b. minimize (reduction of Area of Direct Impact/Effect);</li> <li>c. mitigate (historic context statement, Historic American Engineering Record, Historic American Building Survey, advanced DPR recordation).</li> </ul> <p style="padding-left: 40px;"><b>Traditional Cultural Property:</b></p> <ul style="list-style-type: none"> <li>a. consult with Native American stakeholders on perceived impacts/effects and negotiate mutually agreeable treatment.</li> </ul>

APM ID	APM Language
CUL-2 (Cultural Resources)	<p data-bbox="553 327 1458 548">During construction, it is possible that previously unknown archaeological or other cultural resources or human remains could be discovered. Prior to construction, SCE would prepare a Construction Monitoring and Unanticipated Cultural Resources Discovery Plan or a similar document to be implemented if an unanticipated discovery is made. At a minimum the Plan would detail the following elements:</p> <ul data-bbox="597 564 1463 1507" style="list-style-type: none"> <li data-bbox="597 564 1442 709">▪ Worker and supervisor training in the identification of cultural remains that could be found in the Proposed Project area, and the implications of disturbance and collection of cultural resources per applicable federal and state laws</li> <li data-bbox="597 726 1442 871">▪ Worker and supervisor response procedures to be followed in the event of an unanticipated discovery, including appropriate points of contact for professionals qualified to make decisions about the potential significance of any find</li> <li data-bbox="597 888 1463 961">▪ Identification of persons authorized to stop or redirect work that could affect the discovery, and their on-call contact information</li> <li data-bbox="597 978 1300 1052">▪ Procedures for monitoring construction activities in archaeologically sensitive areas</li> <li data-bbox="597 1068 1442 1178">▪ A minimum radius around any discovery within which work would be halted until the significance of the resource has been evaluated and mitigation implemented as appropriate</li> <li data-bbox="597 1194 1349 1268">▪ Procedures for identifying and evaluating the historical significance of a discovery</li> <li data-bbox="597 1285 1446 1394">▪ Procedures for consulting Native Americans when identifying and evaluating the significance of discoveries involving Native American cultural materials</li> <li data-bbox="597 1411 1430 1507">▪ Procedures to be followed for treatment of discovered human remains per current state law and protocol developed in consultation with Native Americans</li> </ul>
PAL-1 (Paleontological Resources)	<p data-bbox="553 1530 1442 1713">Potential effects of the Proposed Project to sensitive paleontological resources may be mitigated or reduced to a less than significant level by implementing a Paleontological Resource Mitigation and Monitoring Plan which would identify monitoring and treatment requirements for sensitive paleontological resources of significance.</p>

## 1.0 PURPOSE AND NEED

As part of the Renewable Energy Transmission Initiative (“RETI”)<sup>1</sup>, the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas, significant portions of which are under Bureau of Land Management (“BLM”) jurisdiction, have been identified to be rich solar and wind resource areas in the State of California. In addition, the Desert Renewable Energy Conservation Plan (“DRECP”)<sup>2</sup> has also identified large amounts of renewable generation potential in the Mojave Desert area<sup>3</sup>. Existing generation in these areas, together with most of the identified future generation potential in the RETI competitive renewable energy zones and a significant portion of the generation potential in the DRECP development focus areas, would ultimately flow into Kramer Substation in Kramer Junction, CA and would then need to be exported south to Lugo Substation located in Hesperia, CA to serve customer demand in the Los Angeles basin.

One of the major existing bottlenecks that would preclude the transfer of energy produced from renewable resources accumulating at Kramer Substation to Lugo Substation, is referred to as the Kramer-Lugo transmission corridor. ~~This corridor consists of two 220 kilovolt (“kV”) and two 115 kV transmission lines with limited transfer capability due to existing facility limitations. Specifically, the Kramer-Lugo No.1 and No.2 220 kV transmission lines are currently at thermal capacity under peak system conditions, cannot be upgraded, and have become a transmission bottleneck.~~ A second existing bottleneck that would also preclude the transfer of energy from future renewable resources developing in the Lucerne Valley area, near SCE’s future Jasper Substation, is referred to as the Lugo-Pisgah transmission corridor. Figure 1.0-A depicts a block diagram of the major transmission facilities associated with these two corridors and Table 1.0-A identifies the existing generation in the Kramer System.

7	BLM (E7G, E8G & )	Geothermal	100.7	100.7	12/05/1988	03/12/2019	Inyokern	West Mojave & Eastern Slopes

<sup>1</sup> The nameplate capacity values were obtained from a variety of sources including but not limited to generation interconnection agreements, power purchase agreements, distribution service agreements, generation interconnection applications, the Qualifying Facilities Semi-Annual Status Report to the CPUC, and the CAISO's Generating Capability List.

<sup>2</sup> Net MW to Grid are the actual MW values that get injected into the electric grid due to factors including but limited to on-site auxiliary loads, contractual limitations, and facility constraints. The Net MW to Grid values are obtained from <http://www.aiso.com/Documents/AppendixADraft2013-2014TransmissionPlan.pdf> (pp. A-15-A-16). The MW values to from the Draft 2013-2014 plan are used since the Board Approved 2013-2014 Plan's North of Lugo generation values have numerous typos that have not been corrected.

<sup>3</sup> Online date ranges indicate the generation facility has multiple generators which came on-line during different years. The earliest and latest dates for the range are provided.

<sup>4</sup> Expected retirement date ranges indicate the generation facility has multiple generators which will retire during different years. The earliest and latest dates for the range are provided. The term "undefined" indicates there is no contractual obligation for the generation facility to retire. It should also be noted that any generator could choose to extend its retirement date by amending or entering into a new contract.

*This page is intentionally blank*

Per Figure 1.0-A, up to 1,729 megawatts<sup>1</sup> (“MW”) of power is produced in the Kramer System and up to 464 MW<sup>2</sup> is consumed by local electrical demand, which leaves an excess of approximately 1,265 MW of power during peak load demand periods that needs to be exported from Kramer Substation to Lugo Substation. The existing two 220 kilovolt (“kV”) and two 115 kV transmission lines that export this power have a combined approximate capacity of 1,340 MW.<sup>3</sup> By subtracting the excess generation amount (1,265 MW) from the Kramer-Lugo transmission corridor capacity (1,340 MW), the remaining Kramer-Lugo transmission capacity is approximately 75 MW for the year 2014.

On August 22, 2006, Mojave Solar LLC applied to the California Independent System Operator (“CAISO”) for interconnection of the proposed Mojave Solar Project pursuant to Section 3.5 of the Larger Generator Interconnection Procedures issued under the CAISO Tariff. The Queue #125 Mojave Solar Project is a solar thermal generating facility, currently being constructed in Hinkely California, which will interconnect into SCE’s Sandlot<sup>4</sup> Substation and ultimately inject 275 MW<sup>5</sup> into Kramer Substation and exceed the remaining Kramer-Lugo transmission corridor capacity. The CAISO and SCE performed multiple generation interconnection studies<sup>6</sup> and determined a new Coolwater-Lugo 220 kV line is needed to provide the additional transmission capacity necessary for the Mojave Solar Project. The CAISO, SCE, and Mojave Solar LLC entered into a Generation Interconnection Agreement (“GIA”), which requires the construction of the Coolwater-Lugo 220 kV line, and this GIA<sup>7</sup> was filed at FERC with an effective date of January 30, 2011.<sup>8</sup> In addition, on December 09, 2010 SCE filed a Petition for Declaratory Order for Incentives Rate Treatment on the Coolwater-Lugo Transmission Project (“Coolwater-Lugo”) to the Federal Energy Regulatory Commission (“FERC”) and the FERC granted Abandoned Plant Recovery and Construction Work in Progress

<sup>1</sup> Net MW to Grid with “0” values indicate the projects will not export and will serve their own site load. However, projects installing generation to serve their own load effectively reduce the overall Kramer area load, which increases MW flows on the Kramer-Lugo Transmission Corridor and aggravates the existing transmission capacity bottleneck between Kramer and Lugo Substations.

<sup>2</sup> The online date is the generation project’s requested date as noted in the CAISO or SCE generation queues. The Retirement date is 20 years added to the online date. Many projects with online dates before the operational date of Coolwater-Lugo will need to wait for the Coolwater-Lugo to be in-service before they can generate as indicated in Table 1.0-N.

<b><u>Total =</u></b>			<b><u>262.6</u></b>	<b><u>260.0</u></b>							

<sup>1</sup> The online date is the generation project's requested date as noted in the CAISO or SCE generation queues. The Retirement date is 20 years added to the online date. Many projects with online dates before the operational date of Coolwater-Lugo will need to wait for the Coolwater-Lugo to be in-service before they can generate as indicated in Table 1.0-N

These thirteen projects total 695.7 MW and many are located in RETI Competitive Renewable Energy Zones (CREZs) or DRECP Development Focus Areas (DFAs) as indicated in the tables. Furthermore, as shown in Tables 1.0-E to 1.0-I, the RETI Phase 2B<sup>1</sup> report, the DRECP<sup>2</sup> report, and RPS Portfolios for 2014 LTPP and 2014-15 TPP<sup>3</sup> all anticipate large amounts of MW development in the Kramer System and the Lucerne Valley Area. In addition, 144 projects totaling 9,229 MW have withdrawn out of the Kramer System and 14 projects totaling 3,213 MW have withdrawn from the Lucerne Valley area, as depicted in Tables 1.0-J, 1.0-K, and 1.0-L. The existing queued generation, the expected RETI and DRECP generation, and the large amounts of withdrawn generation all indicate these areas are rich renewable resource areas.

**Table 1.0-E RETI CREZ MW Located in the Kramer System**

#	CREZ	Biomass MW	Geothermal MW	Solar Thermal MW	Wind MW	Total MW

The existing queued and future generation projects requesting interconnection into the Kramer System and future Jasper Substation to be located in Lucerne Valley are studied in the Generation Interconnection Process by the CAISO and SCE. These generation interconnection studies identify the necessary system upgrades needed to safely and reliably interconnect new generation to the SCE electric grid. System upgrades identified in the Generation Interconnection Studies are also studied in the CAISO's Annual Transmission Plan, where SCE and other stakeholders participate. Table 1.0-M lists the generation interconnection studies and Annual Transmission Plans that demonstrate the continued need for Coolwater-Lugo.

**Table 1.0-M Studies Supporting the Need for Coolwater-Lugo**

#	Study or Filing	Date	Performed by <sup>1</sup>	Study Results & Relation to Coolwater-Lugo
1	<u>Harper Lake Solar Plant Generator Interconnection Feasibility Study</u>	<u>4/2/07</u>	<u>CAISO &amp; SCE</u>	<u>The Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q125 Mojave Solar Project.</u>
2	<u>Harper Lake Solar Plant Project Interconnection System Impact Study</u>	<u>6/27/08</u>	<u>CAISO &amp; SCE</u>	<u>The Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q125 Mojave Solar Project.</u>
3	<u>KM Acquisitions Interconnection System Impact Study</u>	<u>7/29/08</u>	<u>CAISO &amp; SCE</u>	<u>The Q142 KM Acquisitions Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q142 KM Acquisitions Project.</u>
4	<u>Harper Lake Solar Plant Project Technical Assessment</u>	<u>12/12/08</u>	<u>SCE</u>	<u>This study took into account various queued ahead generation project withdrawals and determined the Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line was specifically identified to provide another power path from Kramer to Lugo to mitigate the identified overloads in order to safely &amp; reliability interconnect the Q125 Mojave Solar Project.</u>
5	<u>KM Acquisitions Technical Assessment</u>	<u>12/18/08</u>	<u>SCE</u>	<u>This study took into account various queued ahead generation project withdrawals and determined the Q142 KM Acquisitions Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line was specifically identified to provide another power path from Kramer to Lugo to mitigate the identified overloads in order to safely &amp; reliability interconnect the Q142 KM Acquisitions Project.</u>
6	<u>CAISO LGIP Transition Cluster Phase 1 Interconnection Study SCE's East of Lugo Bulk System Group Network Analysis</u>	<u>7/28/09</u>	<u>CAISO &amp; SCE</u>	<u>The incremental output of the Transition Cluster Phase 1 East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
7	<u>LGIP Cluster 1 Phase 1 Interconnection Study Report SCE's East of Lugo Bulk System</u>	<u>5/28/10</u>	<u>CAISO &amp; SCE</u>	<u>The incremental output of the Cluster 1 Phase 1 East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
8	<u>Transition Cluster Phase II Interconnection Study Report SCE's East of Lugo Bulk System</u>	<u>8/12/10</u>	<u>CAISO &amp; SCE</u>	<u>This study took into account various queued generation withdrawals and modifications from Transition Cluster Phase 1 to Transition Cluster Phase 2 and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
9	<u>QC 2 Phase 1 Interconnection Report SCE's East of Lugo Bulk System</u>	<u>11/12/10</u>	<u>CAISO &amp; SCE</u>	<u>The incremental output of the QC 2 Phase 1 Interconnection East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>

<sup>1</sup> Generation interconnection studies are not public proceedings or final decisions. The CAISO Annual Transmission Plans are public proceedings, but final decisions.

**1.0 PURPOSE AND NEED**

#	Study or Filing	Date	Performed by <sup>1</sup>	Study Results & Relation to Coolwater-Lugo
10	<u>FERC Icentive Filing</u>	<u>3/11/11</u>	<u>FERC</u>	<u>Final decision granting SCE recovery of 100 percent construction work in progress (CWIP) and recovery of 100 percent of prudently-incurred abandoned plant costs for most project components of Coolwater-Lugo.</u>
11	<u>CAISO 2010-2011 Transmission Plan</u>	<u>5/18/11</u>	<u>CAISO &amp; SCE</u>	<u>The Coolwater-Lugo 220 kV line is identified as an element supporting renewable energy goals, as being needed for deliverability in three of the four studied planning scenarios, as having 600 MW Renewable Deliverability Potential, as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.</u>
12	<u>QC 3 Phase 1 Interconnection Study Report SCE's East of Lugo Bulk System</u>	<u>5/27/11</u>	<u>CAISO &amp; SCE</u>	<u>The incremental output of the QC 3 Phase 1 Interconnection East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
13	<u>Queue Cluster 1 &amp; 2 Phase II Interconnection Study Report SCE's East of Lugo Bulk System</u>	<u>8/26/11</u>	<u>CAISO &amp; SCE</u>	<u>This study took into account various queued generation withdrawals and modifications from Queue Cluster 1 &amp; 2 Phase 1 to Queue Cluster 1 &amp; 2 Phase 2 and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>

15	<u>Cluster 1 &amp; 2 Deliverability Re-Assessment</u>	<u>1/31/12</u>	<u>CAISO</u>	<u>This study was performed by the CAISO pursuant to the 10/31/12 Technical Bulletin on Cluster 1-4 Deliverability Procedures and for the sole purpose of applying those procedures to Cluster 1 &amp; Cluster 2. This analysis concluded the Coolwater-Lugo 220 kV T/L was still required in order to provide additional transmission capacity.</u>
16	<u>CAISO 2011-2012 Transmission Plan</u>	<u>3/23/12</u>	<u>CAISO &amp; SCE</u>	<u>The Coolwater-Lugo 220 kV line is identified as modeled in the policy-driven planning base cases, as serving the Kramer, Inyokern, Owens Valley, and San Bernardino-Lucerne CREZs, and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.</u>
17	<u>QC3 and QC4 Phase II Interconnection Study Report SCE's North of Lugo Bulk System</u>	<u>11/9/12</u>	<u>CAISO &amp; SCE</u>	<u>This study took into account various queued generation withdrawals and modifications from Queue Cluster 3 &amp; 4 Phase 1 to Queue Cluster 3 &amp; 4 Phase 2 and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
18	<u>Queue Cluster 5 Phase 1 Interconnection Study Report SCE's North of Lugo System</u>	<u>1/31/13</u>	<u>CAISO &amp; SCE</u>	<u>The incremental output of the Queue Cluster 5 Phase 1 Interconnection North of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>
19	<u>CAISO 2012-2013 Transmission Plan</u>	<u>3/20/13</u>	<u>CAISO &amp; SCE</u>	<u>The Coolwater-Lugo 220 kV line is identified as ensuring the deliverability of 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone, in the Commercial Interest portfolio. The Coolwater-Lugo 220 kV line was also identified to address the diverged power flow solution on the Kramer 230 kV-Lugo 230 kV #1 and #2 lines contingency, as needed additional network transmission to support renewable energy goals, as providing 700-1,100 MW of deliverability, and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.</u>
20	<u>QC5 Phase II Interconnection Report SCE North of Lugo Area</u>	<u>12/3/13</u>	<u>CAISO &amp; SCE</u>	<u>This study took into account various queued generation withdrawals and modifications from Queue Cluster 5 Phase I to Queue Cluster 5 Phase 2 and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.</u>

#	Study or Filing	Date	Performed by <sup>1</sup>	Study Results & Relation to Coolwater-Lugo
21	Queue Cluster 6 Phase I Interconnection Study Report SCE North of Lugo Area	1/17/14	CAISO & SCE	The incremental output of the Queue Cluster 5 Phase 1 Interconnection North of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
22	CAISO 2013-2014 Transmission Plan	3/12/14	CAISO & SCE	The Coolwater-Lugo 220 kV line is identified as needed additional network transmission to support renewable energy goals and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.

Table 1.0-N provides a list of all queued generation in the Kramer System and at future Jasper Substation and indicates how Coolwater-Lugo supports the interconnection of each project.

**Table 1.0-N Queued Kramer & Jasper Generation & Coolwater-Lugo Need**

#	CAISO or SCE Queue #	Net MW to Grid	Point of Interconnection	Coolwater-Lugo Need
1	125	250.0	Sandlot Substation	Q125's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor, consume that corridor's remaining capacity, and create Base Case and contingency overloads. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
2	142	80.0	Kramer Substation	Q142's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
3	909	25.0	Sandlot Substation	Q909's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
4	WDT315	40.7	Control Substation	WDT315's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
5	5707	0.0	Edwards Substation	5707 is a 1.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 1.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 1.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.

**1.0 PURPOSE AND NEED**

<b>#</b>	<b>CAISO or SCE Queue #</b>	<b>Net MW to Grid</b>	<b>Point of Interconnection</b>	<b>Coolwater-Lugo Need</b>
6	<u>5708</u>	<u>0.0</u>	<u>Edwards Substation</u>	<u>5708 is a 0.99 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 0.99 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 0.99 MW, and which will aggravate the Kramer-Lugo transmission constraint.</u>
7	<u>5709</u>	<u>0.0</u>	<u>Edwards Substation</u>	<u>5709 is a 1.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 1.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 1.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.</u>
8	<u>5729</u>	<u>0.0</u>	<u>Rickover 33 kV line</u>	<u>5729 is a 11.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 11.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 11.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.</u>
9	<u>5879</u>	<u>0.0</u>	<u>Montara 33 kV line</u>	<u>5879 is a 0.3 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 0.3MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 0.3 MW, and which will aggravate the Kramer-Lugo transmission constraint.</u>
10	<u>WDT930</u>	<u>20.0</u>	<u>Baroid 33 kV line</u>	<u>Q930's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.</u>
11	<u>WDT931</u>	<u>20.0</u>	<u>Remote 33 kV line</u>	<u>Q931's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.</u>
12	<u>552</u>	<u>60.0</u>	<u>Jasper Substation</u>	<u>The combined MW output of Q552 &amp; Q897 will exceed the transmission capacity on the existing Lugo-Pisgah No.1 220 kV line. Coolwater-Lugo will rebuild the portion this line from the Jasper Substation area, west to Lugo Substation and would provide additional capacity to accommodate Q552 &amp; Q897.</u>
13	<u>897</u>	<u>200.0</u>	<u>Jasper Substation</u>	<u>The combined MW output of Q552 &amp; Q897 will exceed the transmission capacity on the existing Lugo-Pisgah No.1 220 kV line. Coolwater-Lugo will rebuild the portion this line from the Jasper Substation area, west to Lugo Substation and would provide additional capacity to accommodate Q552 &amp; Q897.</u>

**Total = 695.7**

The proposed construction and upgrade of transmission and substation facilities would be required to deliver the power produced in these areas to utility load centers. The purpose of the proposed Coolwater-Lugo Project, planned to be operational by 2018, is to provide additional transmission capacity to help alleviate the 220 kV transmission bottlenecks between the existing Kramer and Lugo Substations and between the Lucerne Valley area and Lugo Substation, to facilitate the interconnection of renewable generation projects, to accommodate future load serving in the High Desert Region, particularly in

the Town of Apple ValleyTown of Apple Valley, and to facilitate additional system reliability. Specifically, Coolwater-Lugo would ensure the deliverability<sup>1</sup> of the Commercial Interest Portfolio’s 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan.<sup>2</sup> Deliverability, from the perspective of individual generator resources, ensures that, under normal transmission system conditions, if capacity resources are available and called on, their ability to provide energy to the system at peak load will not be limited by the dispatch of other capacity resources in the vicinity from a resource adequacy perspective.

From a reliability perspective, without installation of a Lugo No.3AA 500/220 kV transformer bank, the capacity of Coolwater-Lugo would be dictated by the remaining capacity of the existing Lugo No.1AA & No.2AA 500/220 kV transformer banks which have an anticipated remaining approximate capacity between 500 MW to 1,000 MW in the year 2018 under minimum to maximum load conditions. Reliability, from the perspective of individual generator resources, ensures that, under normal and abnormal transmission system conditions, if capacity resources are available and called on, they are able to provide energy to the system under minimum to maximum load conditions compliant with Reliability Standards and the Regional Business Practices developed by the CAISO, WECC, NERC, and the individual utility.

The capacity of Coolwater-Lugo and its continued ability to relieve transmission constraints in the Kramer-Lugo and Lugo-Pisgah Corridors will be tied to load growth, 3<sup>rd</sup> party generation projects pursuing development in the Kramer Area and at future Jasper Substation, and the specific point of interconnections (POI) of those 3<sup>rd</sup> party generation projects. The generation interconnection studies identified in Table 1.0-M have considered a wide range of load forecasts and actual queued generation scenarios and demonstrate the effectiveness of Coolwater-Lugo at relieving existing transmission constraints in the load forecast and generation interconnection horizons.

The proposed Coolwater-Lugo scope would consist of installing new transmission lines, new substation facilities to support line termination, and telecommunication facilities to support use of a Special Protection System (“SPS”)<sup>3</sup>. The transmission line would utilize a combination of single-circuit and double-circuit structures consisting of 220 kV and 500 kV design standards between the existing Coolwater Generation Station 220 kV

---

<sup>1</sup> <http://www.caiso.com/Documents/On-PeakDeliverabilityAssessmentMethodology.pdf> (p. 1)

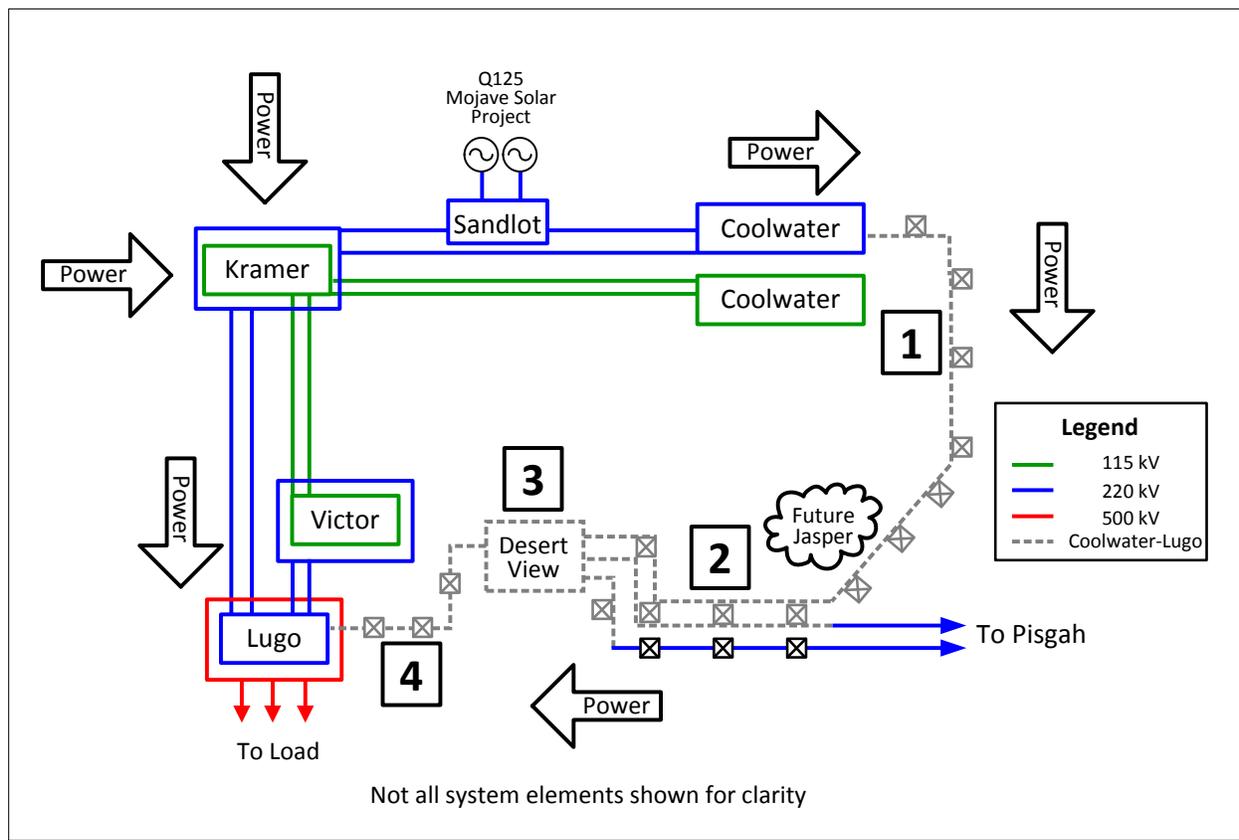

<sup>2</sup> . <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf> (p. 155)

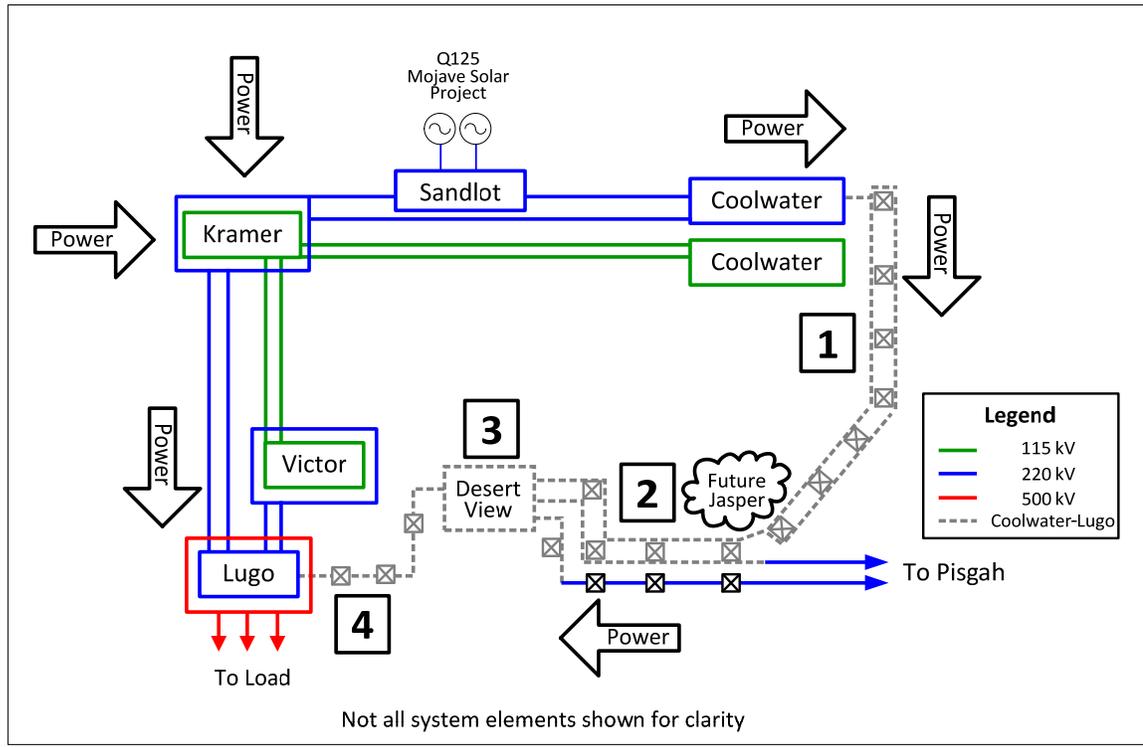

<sup>3</sup> As defined by the NERC, a SPS is an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and MVAR), or system configuration to maintain system stability, acceptable voltage, or power flows.

## 1.0 PURPOSE AND NEED

Switchyard (“Coolwater Switchyard”) and the existing CAISO-controlled Lugo Substation, in order to provide an additional path for power to flow from Kramer Substation ultimately to Lugo Substation. Routing of the transmission line south from Coolwater Switchyard through the Lucerne Valley area to SCE existing transmission ROW, would facilitate future connection to SCE proposed future Jasper Substation, which is a separate project that ~~would be is being~~ developed approximately 22 miles south of Coolwater Switchyard and 27 miles northeast of Lugo Substation. ~~In addition, a new~~ 500/220 kV transformer bank would be installed at Lugo Substation and A new Desert View Substation with ultimate design for 500/220/115/12 kV, would be sited and partially constructed approximately 16 miles northeast of Lugo Substation along the proposed transmission line route as part of Coolwater-Lugo in order to consolidate the new Coolwater-Lugo 220 kV line into the existing SCE ROW. Figures 1.0-B and 1.0-C depict block diagrams of the Coolwater-Lugo’s Minimum and Initial Buildout scenarios.

**Figure 1.0-B Coolwater-Lugo Minimum Buildout**

**Figure 1.0-C Coolwater-Lugo Initial Build Out**

As depicted by the four numbered squares in Figure 1.0-B, the Coolwater-Lugo's Minimum Buildout is the minimum facilities necessary to fulfill the contractual obligation of the Q125 Mojave Solar LGIA and would consist of the following main transmission facilities:

1. Approximately 34.0 miles of double-circuit structures with an initial 220 kV circuit from the existing Coolwater 220 kV Substation south to the existing SCE Lugo-Pispah transmission corridor.
2. Tear down and rebuild of approximately 13.6 miles of the existing capacity limited single-circuit Lugo-Pispah No.1 220 kV transmission line with higher capacity two bundled 1,590 thousand circular mils aluminum conductor steel reinforced ACSR ("2B-1590 ACSR") conductor. The new line from the Coolwater 220 kV Substation would be connected to the north side of the new double-circuit structures and the remaining portions of the existing Lugo-Pispah No.1 220 kV transmission line would be connected to the south side of the new double-circuit structures.
3. Grade an initial 13.5 acres at Desert View and construct an initial four-position 220 kV Switchrack in order to combine the three lines coming from the east into one high capacity line going west to Lugo Substation in order to stay within the existing SCE ROW.

4. Tear down and rebuild of approximately 16.6 miles of the existing capacity limited Lugo-Pisgah No.1 and No.2 220 kV transmission lines with one single circuit 500 kV transmission line, utilizing 2B-2156 ACSR conductor, initially operated at 220 kV from the Desert View 220 kV Switchrack west to Lugo Substation.

However, given the additional large amounts of generation projects in queue in the Kramer System and at Jasper Substation, the need to interconnect additional renewable projects in order to maintain the 33% RPS past the year 2020, the growing electrical demand in the High Desert Area, and the future need for increased system reliability, SCE is proposing to construct the Initial Buildout rather than the Minimum Buildout, in consideration of the long-term planning forecast and in order to minimize the cost, lead time, and environmental disturbance of expected incremental upgrades within the Coolwater-Lugo Project area that are expected to occur within or just beyond the 10-year planning window.

The four numbered squares in Figure 1.0-C depict the facilities that SCE proposes to build as an Initial Buildout.

- a. Area “1” in Figure 1.0-C depicts a double-circuit 220 kV line operated in a box-loop configuration, where both sides of the new double-circuit structures would be strung, but operated as a single circuit. Using double-circuit structures and initially stringing both sides would be cheaper and have less environmental disturbance than either initially constructing one single-circuit line and having to build a second separate single-circuit line later, or using double-circuit structures and only initially stringing one side of the towers and having to string the second circuit at a later date. Stringing both sides of the double-circuit towers initially in a box-loop configuration would reduce material purchases and crew mobilizations and would also allow for special conductor phasing to significantly reduce electrical and magnetic fields (“EMF”).
- b. Area “2” in Figure 1.0-C would remain the same as the minimum build out.
- c. Area “3” in Figure 1.0-C would include the grading of the full 86 a acres at Desert View, instead of the minimum grading of just 13.5 acres, with the constructing of the initial four-position 220 kV Switchrack in order to combine the three lines coming from the east into one high capacity line going to the west to Lugo Substation in order to stay within the existing SCE ROW. Grading of the additional 73.5 acres, 86 acres total, would ensure alignment in grading of all 86 acres
- d. Area “4” in Figure 1.0-C would remain the same as the Minimum Buildout.

Table 1.0-O provides the purpose and need justification for each major element of Coolwater-Lugo under the Minimum, Initial, and Full Buildout scenarios.

**Table 1.0-O Purpose & Need Justification for the Coolwater-Lugo Elements**

<u>Element<sup>1</sup></u>	<u>Purpose and Need</u>	<u>Mojave Solar LGIA</u>	<u>FERC Incentive Filing</u>	<u>Future CAISO Study, Review, or Approval?</u>	<u>Estimated Need Date</u>
<b><u>Substations</u></b>					
<u>Coolwater</u>	<ul style="list-style-type: none"> <li>• <u>Minimum Build: 220 kV switchyard reconfiguration and supporting equipment required to terminate new transmission line</u></li> <li>• <u>Initial Build: Same as Minimum Build</u></li> <li>• <u>Full Build: Same as Minimum Build</u></li> </ul>	<u>Minimum Build</u>	<u>Minimum Build</u>	<u>Not required</u>	<u>2018</u>
<u>Desert View</u>	<ul style="list-style-type: none"> <li>• <u>Minimum Build: Four-position 220 kV switchrack including all supporting infrastructure located on 86 acres but grading only 13.5 acres and installing a chain link fence around the 13.5 acres. Required to connect four 220 kV transmission lines, facilitate future generation interconnections, future load serving, and future reliability.</u></li> <li>• <u>Initial Build: Same as Minimum Build except for grading the entire 86 acres and installing perimeter wall around the 86 acres instead of a chain link fence around the 13.5 acres.</u></li> <li>• <u>Full Build: Install 500 kV, additional 220 kV, 115 kV, and 12 kV substation facilities. Required at a future point to serve future generation interconnections, load, and reliability.</u></li> </ul>	<u>Minimum Build</u>  <u>Not included in LGIA since LGIA assumed Jasper was moving forward</u>	<u>Minimum Build</u>  <u>Not included in FERC filing since FERC filing contemplated Jasper moving forward</u>	<u>Minimum &amp; Initial Build – It is SCE’s belief that further CAISO Study, Review, Approval is Not Required.</u>  <u>Full Build – The CAISO would study, review and approve the 500 kV &amp; 220 kV Desert View elements expanded beyond the initial 4-position 220 kV switchrack.</u>	<u>Minimum Build – 2018</u>  <u>Initial Build – 2018</u>  <u>Portions of Full Build – 2025 to 2029</u>

<sup>1</sup> The Lugo No. 3AA 500/220kV transformer bank was removed from this table since it is no longer included as a Coolwater-Lugo element.

<p><b><u>Telecommunications</u></b></p>					
<p><u>Fiber Optics, Microwave, and other supporting equipment</u></p>	<p><u>Telecommunications needed to support Coolwater-Desert View, Desert View-Lugo, and Desert View-Pisgah line protection and Special Protection System</u></p>	<p><u>Minimum Build</u></p>	<p><u>Portion<sup>1</sup> of Minimum Build since FERC filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project.</u></p>	<p><u>Not required</u></p>	<p><u>2018</u></p>

<sup>1</sup> Since the FERC Filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project, it did not include the Apple Valley-Desert View fiber optic.

*This page is intentionally blank*

As discussed below, and further discussed in Section 1.1 Project Purpose, the purpose of the proposed Coolwater-Lugo is to:

1. Facilitate achievement of the state-mandated Renewables Portfolio Standard (“RPS”) (i.e., 33% renewable by year 2020 per Senate Bill 2 (“SBX1 2”) in an orderly, rational and cost-effective manner, while also considering the need for maintaining reliable electric service during the upgrade and/or construction of new facilities;
2. Integrate planned renewable generation projects in the Kramer and Lucerne Valley areas and provide for the full delivery of a ~~250~~275 megawatt (“MW”) renewable generation project, known as the Mojave Solar Project, in a manner which minimizes potential environmental impacts. Currently the ~~250~~275 MW renewable generation project is under construction by Abengoa Solar, Inc. (“Abengoa”), the interconnection customer, who has executed a Power Purchase Agreement (“PPA”) pursuant to California Public Utilities Commission (“CPUC”) tariff. Abengoa is seeking interconnection via the CAISO Interconnection Process;<sup>1</sup>
3. Interconnect and deliver energy from up to 1,000 MW ensure the deliverability of the Commercial Interest Portfolio’s 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone as indicated in the 2012-2013 CAISO Annual Transmission Plan<sup>2</sup> in a way that complies with all applicable CAISO, North American Electric Reliability Corporation (“NERC”), and Western Electric Coordinating Council (“WECC”) reliability planning criteria, and in a manner that minimizes transmission line crossings;
4. Support the State of California Greenhouse Gas (“GHG”) Reduction Program;
5. Assist the BLM in meeting the Federal Renewable Energy Mandate to develop 10,000 MW of renewable generation on public lands by 2015;<sup>3</sup>
6. Support ~~California~~SCE’s Renewable Energy Small Tariff (“CREST”), Renewable Market Adjusting Tariff (Re-MAT), and SCE’s Rule 21 Projects. By expanding transmission capacity south of Kramer, Coolwater-Lugo would allow an increased number of SCE retail customers to export to the grid power produced from

<sup>1</sup> Abengoa, CAISO, and SCE executed a Large Generation Interconnection Agreement (“LGIA”) for SCE to construct the Coolwater-Lugo 220 kV transmission line in order to provide the Mojave Solar Project full capacity deliverability. The FERC on January 28, 2011 accepted the LGIA with an effective date of January 30, 2011. FERC Docket Nos. ER11-2204-000 and ER11-2368-000.

<sup>2</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf> (p. 155)

<sup>3</sup> Executive Order 13212, Actions to Expedite Energy-Related Projects, requires federal agencies to expedite review of energy project applications; and the Energy Policy Act of 2005 (Title II, Sec. 211) requires the Department of Interior (“DOI”) to approve at least 10,000 MW of renewable energy on public lands by 2015.

- eligible small-scale renewable energy facilities under CREST, Re-MAT, and Rule 21;
7. Support military desire to serve its own load under Rule 21. Coolwater-Lugo would allow the military facilities in the Kramer Junction and Ridgecrest areas to develop and serve their own load to meet national security goals;
  8. Address the City of Ridgecrest's renewable energy integration concerns by reducing the existing Kramer-Lugo transmission bottleneck and thus allowing increased development of renewable energy projects in the Ridgecrest area, including Rule 21 projects and projects on military facilities;
  9. Facilitate serving future load in High Desert Region, particularly in the Town of Apple Valley. As load continues to grow in the High Desert Region, Victor Substation will reach its load serving limits thereby requiring a new major load-serving substation;
  10. Facilitate reliability improvements in the Lugo-Pisgah Transmission Corridor, at Coolwater 220 kV Substation, and at Lugo Substation. ~~Currently, eight 500 kV transmission lines terminate at Lugo Substation.~~ By developing Coolwater-Lugo, including the Desert View Substation, line protection would be upgraded in the Lugo-Pisgah Transmission Corridor, 220 kV Switchrack upgrades would occur at Coolwater 220 kV Substation, and future transmission lines could be delooped out of Lugo Substation and looped into Desert View Substation improving overall system reliability; and,
  11. Meet project purpose and objectives while minimizing potential environmental effects of Coolwater-Lugo. Specific approaches to minimizing potential environmental effects include:
    - a) Maximizing the use of existing, previously disturbed transmission corridors to minimize potential effects on previously undisturbed land and resources;
    - b) Selecting site, route, and structure locations with the lowest potential for environmental impacts while still meeting project objectives; and,
    - c) Selecting a route that minimizes potential environmental impacts and project costs.

## 1.1 Project Purpose

### 1.1.1 Compliance with Renewable Portfolio Standard

The California RPS was established in 2002 by SB 1078. The RPS required investor-owned utilities, including retail sellers of electricity such as SCE, to increase their sale of electricity produced by renewable energy sources (such as solar and wind) by at least one percent per year, achieving 20 percent by 2017 (at the latest). These requirements were accelerated by the signing of SBX1 2 by Governor Edmund G. Brown, Jr., requiring 20 percent of retail sales from renewables by the end of 2013, 25 percent by the end of 2016, and a 33 percent requirement being met by the end of 2020.<sup>1</sup> In order for investor-owned utilities to satisfy these target goals, new transmission facilities would be required to interconnect remote areas of high renewable generation concentration, and new transmission would be required to eliminate bottlenecks that would preclude delivery of energy produced from these renewable resources to the applicable utility load centers. Coolwater-Lugo is needed to enable California electric utilities to facilitate compliance with the state mandated RPS in a manner that maximizes the use of existing, previously disturbed transmission line right-of-way (“ROW”) in order to minimize potential effects on previously undisturbed land and resources.

Moreover, the California Energy Commission’s (“CEC”) 2011 Integrated Energy Policy Report (“IEPR”) encourages the development of additional transmission infrastructure to interconnect and deliver renewable resources. The IEPR Report identified that the success in meeting the RPS and the GHG Reduction Program is largely dependent upon having the ability to interconnect substantial amounts of new renewable generation. Furthermore it states that the lack of transmission infrastructure to access remote renewable resources is a critical barrier to meeting California’s 2020 electricity and natural gas goals.

### 1.1.2 Integrate Planned Renewable Generation Resources

Under orders issued pursuant to Sections 210 and 212 of the Federal Power Act (16 U.S. Code §§ 824i and 824k) and interconnection agreements executed pursuant to CAISO Fifth Replacement Electric Tariff, SCE is obligated to interconnect and integrate power generation facilities into its electric system and provide for the level of interconnection service requested.

When an electric generating facility makes an interconnection request, the CAISO evaluates whether transmission line upgrades are needed to safely and reliably satisfy the request. If the CAISO analysis indicates that transmission upgrades are needed, then the necessary upgrades are incorporated into a Generator Interconnection Agreement that is entered into by the applicable interconnection customer(s), the utility (such as SCE), and the CAISO.

---

<sup>1</sup> <http://www.energy.ca.gov/portfolio/index.html>

A CAISO Serial interconnection study completed in 2008 identified the need for Coolwater-Lugo. This study indicated that without Coolwater-Lugo, the anticipated addition of new generation resources in the Barstow, Inyokern, Kramer, and Owens Valley areas would result in unacceptable thermal overload conditions on the existing Kramer-Lugo transmission corridor. During the interconnection studies, it was determined that Coolwater-Lugo could not be operational until 2018 due to estimated licensing and construction timelines. Coolwater-Lugo has since been included in the CAISO’s 2010-2011<sup>1</sup>, 2011-2012<sup>2</sup>, and 2012-2013<sup>3</sup>, and 2013-2014<sup>4</sup> Transmission Plans<sup>5</sup> and is referenced by the CAISO as an upgrade necessary to meeting California’s 33% RPS<sup>6</sup>.

As of July 5, 2013, there were a total of 17 active interconnection requests to SCE’s transmission system in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas in the CAISO and SCE interconnection queues totaling 1,994.1 MW. Table 1.0-A lists all active generation interconnection requests in the Barstow, Inyokern, Kramer, and Owens Valley areas (“Kramer Junction Area”), while Table 1.0-B lists all the active generation interconnection requests in the Lucerne Valley area.

**Table 1.0-A Kramer Junction Area Generation Interconnection Requests**

<sup>3</sup> <http://www.aiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

<sup>4</sup> <http://www.aiso.com/Documents/RevisedDraft2013-2014TransmissionPlan.pdf>

<sup>5</sup> The CAISO Transmission Plans identified a 220 kV transmission line with approximately 43 circuit miles of bundled 2B-1590 KCMIL ACSR conductor and approximately 16 circuit miles of bundled 2B-2156 KCMIL ACSR conductor, from Coolwater Switchyard to Lugo Substation, and an SPS and associated telecommunication facilities. In addition, as a result of SCE’s siting process to identify alternative locations for this route, SCE has determined the need for additional scope, to include the initial construction of a 220 kV switchrack (“Desert View Substation”) to facilitate construction of the Proposed Route, as described in Chapter 3.0, *Project Description*. Full build out of the Desert View Substation would be completed as needed over time to facilitate load serving, reliability, and future generation interconnections as detailed in Project Objective 2 and Project Objective 9.

Consequently, Coolwater-Lugo, summarized in Section 1.6, *Project Summary*, would enable California utilities to access and deliver the output of renewable generation projects in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas and thus satisfy SCE’s obligation to interconnect and integrate power generation facilities, providing the level of service requested, into the electric grid.

### 1.1.3 Comply with Reliability Standards

Coolwater-Lugo would allow SCE to comply with NERC<sup>1</sup> Reliability Standards and the WECC Regional Business Practices.<sup>2</sup> Transmission lines must be planned in accordance with Reliability Standards and the Regional Business Practices developed by the CAISO, WECC, NERC, and the individual utility.<sup>3</sup> These Standards require that the potential “loss” of transmission lines (both proposed and existing lines) be analyzed and the transmission system be designed to continue to function if a “loss” occurs. A transmission line would be considered “lost” when removed from service due to planned or unplanned events. In accordance with these Reliability Standards, SCE must utilize acceptable measures to ensure electric system reliability is maintained in the event of a loss of one or more transmission lines within the same transmission corridor. Depending

<sup>2</sup> WECC’s Regional Business Practices are available at: <http://www.wecc.biz/library/Documentation%20Categorization%20Files/Regional%20Business%20Practices/TPL-001-WECC-RBP-2.pdf>

<sup>3</sup> SCE’s transmission planning standards are available at [https://www.sce.com/wps/wcm/connect/c827954f-98c8-4819-965f-f824f466fbb3/030413\\_InterconnectionHandbook.pdf?MOD=AJPERES](https://www.sce.com/wps/wcm/connect/c827954f-98c8-4819-965f-f824f466fbb3/030413_InterconnectionHandbook.pdf?MOD=AJPERES).

on transmission planning studies, these measures may include installation of a SPS,<sup>1</sup> construction of additional facility upgrades, or both.

#### **1.1.4 Support California's Greenhouse Gas Reduction Program**

With the signing of Assembly Bill ("AB") 32<sup>2</sup>, California has embarked on an ambitious program to reduce GHG emissions. The 2006 IEPR Update states that "achieving the state's RPS goals is an essential component of California's GHG emission reduction targets."

Coolwater-Lugo would enable California to integrate renewable resources such as solar and wind, which could help the State of California achieve GHG emissions reduction targets by reducing reliance on energy sources that result in high levels of GHG emissions.

#### **1.1.5 Support Federal Renewable Energy Mandate**

Executive Order 13212, Actions to Expedite Energy-Related Projects, requires Federal agencies to expedite review of energy project applications.

The Energy Policy Act of 2005 (Title II, Sec. 211) requires the Department of Interior to approve at least 10,000 MW of renewable energy on public lands by 2015.

#### **1.1.6 Support CREST, Re-MAT, and Rule 21 Projects**

Under the CREST, created by California's AB 1969 and SB 380, and as implemented by the CPUC, SCE is required to purchase power from SCE retail customers who own and operate an eligible renewable generator with a total effective generation capacity of not more than three MW. In addition, Re-MAT implements a renewable resource feed-in tariff program pursuant to California Public Utilities Code (PUC) Section 399.20 and CPUC Decision (D.) 12-05-035, D.13-01-041, and D.13-05-034. Furthermore, SCE customers have the option to generate their own power under SCE's Rule 21 non-export program.

Since there is more generation than load in the Barstow, Inyokern, Kramer, and Owens Valley areas, any CREST and Re-MAT MW connecting to distribution voltages in these electrical areas would effectively be transferred to the transmission system, flow into Kramer Substation, and would ultimately need to be exported south of Kramer. Furthermore, Rule 21 projects would result in a decrease of local area load which would

---

<sup>1</sup> An SPS is designed to detect abnormal system conditions and take automatic, pre-planned, corrective action (other than the isolation of faulted elements) to provide acceptable system performance. SPS actions may result in reduction in load or generation, or changes in system configuration to maintain system stability, acceptable voltages, or acceptable facility loading.

<sup>2</sup> Cal. Health and Safety Code §§ 38500 to 38599 (2006)

increase the amount of net generation in this region thereby causing additional power to flow into Kramer Substation that would ultimately need to be exported south. Because the system in the South of Kramer area is already constrained, CREST and Rule 21 projects would further aggravate system reliability caused by the bottleneck associated with the two capacity constrained Kramer-Lugo 220 kV transmission lines. Small projects seeking export under CREST and Rule 21 have therefore been blocked from development and because of their size, have complained about the lack of transmission capacity in this region and their inability to develop.

### **1.1.7 Support Military Desire to Serve their Load under Rule 21**

Several military installations within the Kramer Junction and Ridgecrest areas have expressed a desire to participate in Rule 21 projects in order to serve their site load for national security purposes. As previously stated, Rule 21 projects result in reduced local area load. This condition would cause more power to flow into Kramer Substation, which would ultimately need to be exported south. As Rule 21 projects materialize, an operating procedure to curtail (i.e., turn off) renewable resources may be required. Such a procedure would result in less renewable resources as they are curtailed; thus, adversely impacting the achievement of RPS goals. Coolwater-Lugo would provide additional transmission capacity that would help avoid reducing renewable resource projects, and would also allow military installations to participate in Rule 21 projects and address their national security concerns to serve their load.

### **1.1.8 Address City of Ridgecrest's Renewable Integration Concerns**

The City of Ridgecrest is concerned about the Kramer-Lugo transmission bottleneck and the impact this constraint is having on their ability to add solar generation in their community, to support local military installation Rule 21 projects, and to create jobs. On May 10, 2011, SCE explained the Kramer-Lugo bottleneck constraint to the Ridgecrest City Council Planning Commission and proposed Coolwater-Lugo as a means to help create additional transmission capacity<sup>1</sup>.

### **1.1.9 Facilitate Future Load Serving in the High Desert Apple Valley Region, particularly the Town of Apple Valley**

~~Apple Valley load is currently served out of SCE's Victor Substation, located in the City of Victorville, which is the only major load serving substation providing service to the entire High Desert Region. As load continues to grow in the High Desert Region, Victor Substation will reach its load serving limits thereby requiring a new major load serving substation. A new multipurpose 500/220/115/12 kV substation ("Desert View Substation") placed in an area with significant load, such as the growing Apple Valley load area, would provide the required load serving relief to Victor Substation. The proposed Desert View Substation, to be licensed as part of Coolwater-Lugo, is~~

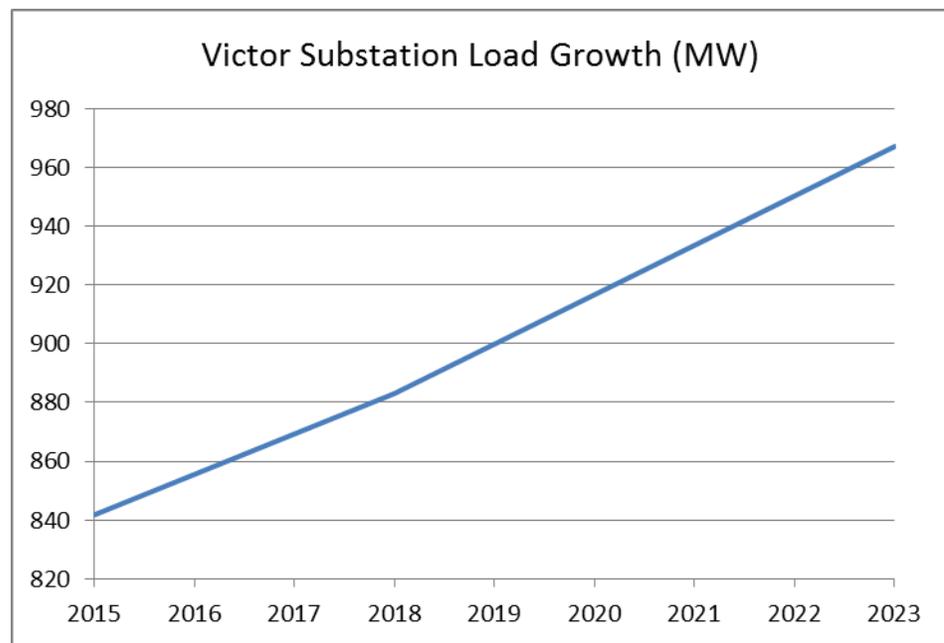

---

<sup>1</sup> <http://ci.ridgecrest.ca.us/doclib/lib/Meetings/PC/Minutes/2011/5-10-11%20PC%20Minutes.pdf>

anticipated to be located approximately 16 miles east of Lugo Substation along the existing Lugo-Pisgah corridor. Since the last 16-mile segment of Coolwater-Lugo's Coolwater-Lugo transmission line into Lugo Substation would be 500 kV construction (initially energized at 220 kV), Coolwater-Lugo would facilitate construction of this proposed multipurpose substation by allowing a 500 kV connection to it without the need for an additional transmission line on new ROW in the future. The future 500 kV constructed, 220 kV operated transmission line that would connect Desert View Substation to Lugo Substation would later be switched to 500 kV operation when the 500 kV section of Desert View Substation is built out in the future.

SCE's Victor Substation, located in the City of Victorville, is the only major load-serving substation providing service to the entire High Desert Region which includes the Town of Apple Valley. As load continues to grow in the High Desert Region, Victor Substation will reach its load serving limits thereby requiring a new major load-serving substation. Figure 1.1-A depicts the Victor Substation load forecast from the 2013-2014 CAISO Transmission Plan<sup>1</sup>, which is based on the California Energy Commission's 1-in-10 year load forecast.

**Figure 1.1-A Victor Substation Load Growth**

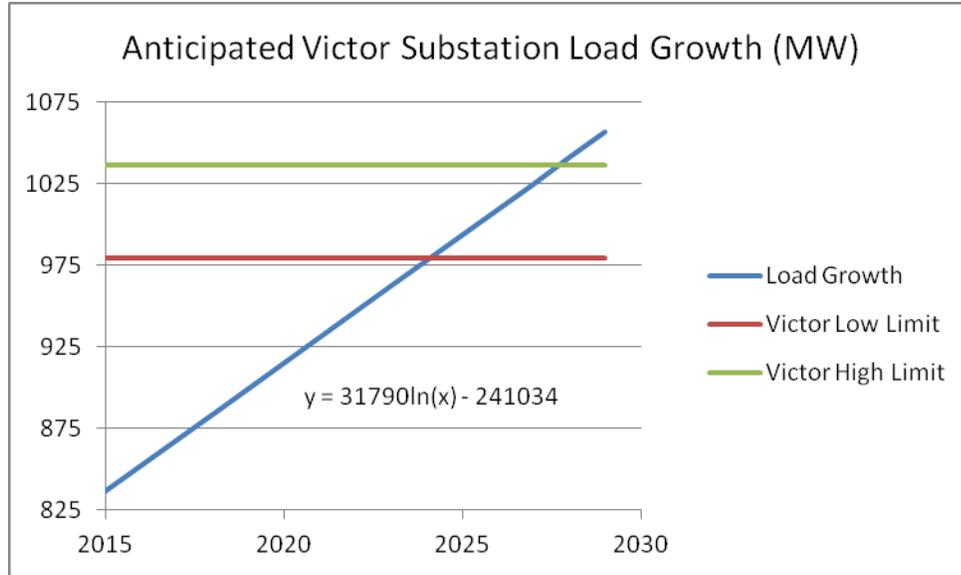

By plotting the load forecast data, the equation of the curve can be calculated and used to approximate the load forecast in the future. Victor Substation's load serving limit under a single contingency on one of its four high voltage transformers is between 979 MW to 1,042 MW. Based on this approximated future load forecast and the Victor Substation load serving limit range, a new Substation would be required in the High Desert area to

<sup>1</sup> <http://www.caiso.com/Documents/RevisedDraft2013-2014TransmissionPlan.pdf> (p. 115)

relieve Victor Substation between the approximate years 2025 and 2029, as depicted in Figure 1.1-B.

**Figure 1.1-B Anticipated Victor Substation Load Growth**

A new multipurpose 500/220/115/12 kV substation (“Desert View Substation”) placed in an area with significant load, such as the growing Town of Apple Valley, would provide the required load-serving relief to Victor Substation. The proposed Desert View Substation, to be licensed as part of Coolwater-Lugo, is anticipated to be located approximately 16 miles east of Lugo Substation along the existing Lugo-Pisgah corridor. The specific Desert View elements required to provide load serving relief to Victor Substation include the following major facilities, which would be phased in as necessary over the 2025 to 2029 time period, starting with the 220 kV and 115 kV facilities:

1. Extension of the Desert View 220 kV Switchrack
2. Installation of at least one of the planned four 220/115 kV transformers, two would be recommended to ensure service is maintained under loss of one of these transformers
3. A 115 kV switchrack
4. Looping of the existing Cottonwood-Savage 115 kV line<sup>1</sup> into the Desert View 115 kV Switchrack

<sup>1</sup> The Cottonwood-Savage 115 kV line is an existing line that runs east-west approximately 0.7 miles north of the proposed and alternate Desert View Substation sites.

5. Looping of the existing Apple Valley-Cottonwood-Pluess-Savage 115 kV line<sup>1</sup> into the Desert View 115 kV Switchrack
6. Installation of at least one of the planned four 115/12 kV transformers
7. A 12 kV switchrack
8. One or more 12 kV distribution lines from the Desert View 12 kV Switchrack into the nearby neighborhood surrounding Desert View Substation

Once the Desert View 115 kV Switchrack is in place, the Cottonwood-Savage and Apple Valley-Cottonwood-Pluess-Savage 115kV lines would be looped into the 115 kV Switchrack allowing Desert View to serve the load on these lines that was previously being served from Victor Substation. In addition, the future Desert View 12 kV Switchrack and future 12 kV distribution lines out of Desert View would serve local area load of the nearby expanding community.

Furthermore, since the last 16-mile segment of Coolwater-Lugo's Coolwater-Lugo transmission line into Lugo Substation would be 500 kV single circuit transmission line, with 2B-2156 ACSR conductor(initially energized at 220 kV), Coolwater-Lugo would facilitate construction of this proposed multipurpose substation by allowing a 500 kV connection to it without the need for an additional transmission line on new ROW in the future. The future 500 kV constructed, 220 kV operated transmission line that would connect Desert View Substation to Lugo Substation would later be switched to 500 kV operation when the 500 kV section of Desert View Substation is built out in the future.

### **1.1.10 Facilitate Reliability Improvements at Lugo Substation in the Lugo-Pisgah Transmission Corridor and at the Coolwater and Lugo Substations**

~~Currently, eight 500 kV transmission lines terminate into SCE's Lugo Substation. Coolwater-Lugo would facilitate construction of a multipurpose 500/220/115/12 kV Desert View Substation which would allow future 500 kV transmission lines to be delooped out of Lugo Substation thus reducing the number of 500 kV transmission lines terminating at Lugo Substation and thereby improving overall system reliability.~~

~~In addition, a SPS is currently required to maintain loadings to within emergency limits under loss of either the Lugo No.1 or No.2 500/220 kV transformer banks, as well as maintain system stability under the loss of both the Lugo No.1 and No.2 500/220 kV transformer banks. Under loss of a single Lugo 500/220 kV transformer bank, the current SPS automatically disconnects (curtails) up to 850 MW of non-renewable resources and under loss of both Lugo 500/220 kV transformer banks, the SPS automatically disconnects (curtails) a significant amount of renewable and non-renewable generation in~~

<sup>1</sup> The Apple Valley-Cottonwood-Pluess-Savage 115 kV line is an existing line that runs east-west approximately 0.1 miles south of the proposed and alternate Desert View Substation sites.

the Barstow, Daggett, Inyokern, and Kramer areas to maintain system reliability and stability. As part of Coolwater-Lugo, a new Lugo No.3 500/220 kV transformer bank would be installed at Lugo Substation, thus reducing the severity under loss of a single Lugo 500/220 kV transformer bank and loss of both Lugo 500/220 kV transformer banks and would reduce the amount of Barstow, Inyokern, and Kramer area generation that needs to be curtailed during this type of event, thus increasing overall system reliability and stability.

Furthermore, this new Lugo No.3 500/220 kV transformer bank will also be required to handle the additional 1,000 MW of system capacity Coolwater-Lugo will provide. Coolwater-Lugo will create a new transmission path from Kramer to Lugo Substation and this additional power will need to be stepped up from 220 kV to 500 kV in order to be delivered to utility load centers. Since the existing Lugo No.1AA and No.2AA 500/220 kV transformers do not have sufficient capability to handle 1,000 additional MW, a third Lugo 500/220 kV transformer will need to be installed as part of Coolwater-Lugo to avoid base case thermal overloads.

The existing Lugo-Pisgah No.1 and No.2 220 kV transmission lines currently have line protection that meets existing CAISO, NERC, and WECC reliability criteria, but which is not aligned with SCE's current line protection standards. Since Coolwater-Lugo would tear down and rebuild approximately 29.1 miles of the Lugo-Pisgah No. 1 220 kV line and also tear down approximately 16.0 miles of the existing Lugo-Pisgah No.2 220 kV line, the line protection from Lugo to Pisgah Substations will need to be upgraded to current SCE standards, which will reduce fault clearing times and improve overall system reliability. Specifically, the existing directional and ground-over-current and step distance protection provided by the existing electromechanical relays on the existing Lugo-Pisgah No.1 and No.2 220 kV lines would be replaced by G.E. L90 and SEL-311L relays with new telecom circuits to provide high speed fault clearing. High speed fault clearing helps to reduce damage to power system equipment, injury to SCE personnel and the public, and extended and widespread outages because the faults are detected and isolated more quickly thus minimize their effect on the system.

The Coolwater 220 kV Switchrack is currently a radial facility not under CAISO control. Construction of Coolwater-Lugo would convert the Coolwater 220 kV Switchrack from a radial facility to a network facility, which would then be under CAISO control. The Coolwater-Lugo work at the Coolwater 220 kV Switchrack would include augmenting the existing disconnect switches on switch rack positions 1, 3, and 6 with circuit breakers in order to isolate faults on those positions from affecting the rest of the Switchrack. Adding circuit breakers to these rack positions would convert them to "double bus double breaker" positions, which is SCE's 220 kV design standard. This arrangement ensures reliability is maintained under outage conditions (forced outage or during maintenance) since it allows for the loss of equipment connected to the substation without affecting all other facilities connected to the substation during such an outage condition. These upgrades would increase the reliability of the Coolwater 220 kV Switchrack in its new network configuration, would simplify future additions, minimize loss of station capacity during forced or planned outages, and improve the selectivity of the system protection.

Moreover, there are currently eight 500 kV transmission lines that terminate at SCE's Lugo Substation. Per the CAISO's 2010-2011<sup>1</sup> and 2011-2012<sup>2</sup> Transmission Plans, loss of the entire Lugo 500/220 kV Substation would cause the north of Lugo system to be unstable. To restore system synchronism, extensive generation tripping in the North of Lugo area and load tripping in the LA Basin would be required. Coolwater-Lugo would facilitate construction of a multipurpose 500/220/115/12 kV Desert View Substation which would allow future 500 kV transmission lines to be delooped out of Lugo Substation thus reducing the number of 500 kV transmission lines terminating at Lugo Substation. This would allow 500 kV system connections to remain which would result in improving overall system reliability by reducing the amount of generation and load that would be need to be tripped under the loss of Lugo Substation.

### **1.1.11 Meet Project Purpose & Objectives while Minimizing Environmental Effects**

In compliance with the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"), Coolwater-Lugo includes and analyzes site and route alternatives that meet the project purpose and objectives while minimizing potential environmental effects. Specific approaches to minimizing environmental effects include:

- a) Maximizing the use of existing, previously disturbed corridors to minimize potential effects on previously undisturbed land and resources;
- b) Selecting site, route, and structure locations with the lowest potential for environmental impacts while still meeting project objectives; and,
- c) Selecting site, route, and structure locations that minimize potential environmental impacts and project costs.

## **1.2 Project Need**

Coolwater-Lugo is needed to interconnect and deliver energy from renewable resources located in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas in a way that complies with all applicable NERC/WECC Planning Standards. All new generation interconnection requests are shown in Tables 1.0-A and 1.0-B. The interconnection studies conducted as mandated by the CAISO Large Generator Interconnection Procedures ("LGIP") and SCE's Wholesale Distribution Access Tariff ("WDAT") have determined that the existing 220 kV transmission lines which connect SCE's Kramer Substation with SCE's Lugo Substation are inadequate to provide for the level of service requested by new planned generation interconnections.

<sup>1</sup> [http://www.caiso.com/Documents/110518Decision\\_TransmissionPlan-RevisedDraftPlan.pdf](http://www.caiso.com/Documents/110518Decision_TransmissionPlan-RevisedDraftPlan.pdf)

<sup>2</sup> [http://www.caiso.com/Documents/Decision\\_2011-12TransmissionPlan-Plan-MAR2012.pdf](http://www.caiso.com/Documents/Decision_2011-12TransmissionPlan-Plan-MAR2012.pdf)

The studies identified that without transmission upgrades, the inclusion of additional generation resources in the Barstow, Inyokern, Kramer, and Owens Valley areas would result in unacceptable thermal overload conditions on the existing Kramer-Lugo No.1 and No.2 220 kV transmission lines due to existing facility limitations. The conclusion of the studies was that these two transmission lines would present a bottleneck that would limit the amount of generation output from the new generation resources to be located in SCE's Kramer Junction area that can be delivered to the utility load centers. ~~In addition, generation pursuing development in the Lucerne Valley area would face a similar bottleneck since the existing Lugo-Pisgah No.1 220 kV transmission line that passes through this area is composed of 605 thousand circular mils ("kcmil") aluminum conductor steel reinforced ("ACSR") conductor with no emergency capability due to line clearance and would be unable to support the 320 MW of queued generation in the Lucerne Valley area or provide sufficient capacity to support the proposed Coolwater-Lugo 220 kV transmission line.~~ In addition, generation pursuing development in the Lucerne Valley area would face a similar bottleneck since the existing Lugo-Pisgah No.1 220 kV transmission line that passes through this area is composed of 605 kcmil ACSR conductor with no emergency capability due to line clearance and would be unable to support the 260 MW of queued generation in the Lucerne Valley area along with existing resources utilizing the transmission line or provide sufficient capacity to support the proposed Coolwater-Lugo 220 kV transmission line.

In order for investor-owned utilities, including retail sellers of electricity such as SCE, to satisfy the RPS goals to increase their sale of electricity produced by renewable energy sources by at least one percent per year, achieving 33 percent by 2020, new transmission facilities would be required to interconnect remote areas of high renewable generation concentration and new transmission would be required to eliminate bottlenecks that would preclude delivery of energy produced from these renewable resources to the utility load centers. The generation interconnection studies identified a transfer capability bottleneck associated with the two Kramer-Lugo 220 kV transmission lines and the existing Lugo-Pisgah No.1 220 kV transmission line which would jeopardize new renewable energy project development.

The state-mandated RPS by definition is based on the actual MW capacity sale. The identified transfer capability bottleneck south of SCE's Kramer Substation and bottleneck in the Lucerne Valley area prevent the sale of the renewable power to customers. To achieve the mandated RPS goals, Coolwater-Lugo is needed to remove the bottleneck limitations and to increase transfer capability from renewable resources into customer areas by creating a new transmission path from Kramer to Lugo Substations and by rebuilding a portion of the existing Lugo-Pisgah No.1 220 kV transmission line from the Lucerne Valley area west to Lugo Substation. Without Coolwater-Lugo, the new generation located in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas could not be deemed deliverable and would be subjected to significant curtailment to avoid overloading the two existing Kramer-Lugo 220 kV transmission lines and the existing Lugo-Pisgah No.1 220 kV transmission line and avoid system stability issues identified in System Impact Studies.

### 1.3 Basic Objectives

CEQA (Pub. Res. Code § 21000, et seq.) and Section 15126.6 (a) of the CEQA Guidelines<sup>1</sup> require the consideration of a reasonable range of alternatives to a proposed project, or the location of a proposed project, that would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project. Section 15126.6 (a) of the CEQA Guidelines also requires that the comparative merits of the alternatives be evaluated. In order to develop a reasonable range of alternatives, Section 15124(b) of the CEQA Guidelines requires that a clearly written statement of objectives be prepared for a proposed project that demonstrates the objectives sought to be achieved by the project and includes the underlying purpose of the project. The range of potential alternatives selected for evaluation shall “include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects.”<sup>2</sup> In addition to the purposes described in the section 1.1 above, SCE has identified the following objectives for meeting Coolwater-Lugo’s purpose and need described in this chapter:

1. Facilitate SCE and other California utilities ~~achievement~~ achieving and maintaining of California’s RPS in an expedited manner;
2. Provide transmission facilities identified as necessary for the full delivery of 1) a ~~250~~ 275 MW renewable generation project located in the Barstow area; 2) future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas;
3. Comply with all applicable reliability planning criteria required by the CAISO, the NERC, and the WECC;
4. Support California’s GHG Reduction Program;
5. Support BLM compliance with the Federal Renewable Energy Mandate;
6. Provide transmission facilities in a timely manner that would facilitate the interconnection of CREST, Re-MAT, and Rule 21 projects;
7. Provide transmission facilities that facilitate the Department of Defense meeting their Energy Mandate of producing or procuring 25% of their total energy from renewable energy sources beginning in 2025 as outlined under the National Defense Authorization Act of 2010;<sup>3</sup>
8. Address transmission capacity concerns from the City of Ridgecrest;

<sup>1</sup> See Cal. Code Regs., tit. 14, §15000, et seq.

<sup>2</sup> Cal. Code Regs., tit. 14, §15126.6(c).

<sup>3</sup> See [http://www.govenergy.com/2010/Files/Presentations/Renewables/2010\\_GovEnergy\\_Tindal.pdf](http://www.govenergy.com/2010/Files/Presentations/Renewables/2010_GovEnergy_Tindal.pdf)

9. License a new multipurpose 500/220/115/12 kV Desert View Substation southeast of the Town of Apple Valley to facilitate load serving, reliability, and future generation interconnections;<sup>1</sup>
10. Construct facilities in an orderly, rational, and cost-effective manner to maintain reliable electric service and by minimizing service interruptions during construction;
11. Minimize potential environmental impacts through selection of transmission routes and substation site locations; including maximizing the use of existing transmission corridors in order to minimize potential effects on previously undisturbed land and resources<sup>2</sup>, and where existing ROW is not available, utilize the shortest route that minimizes potential environmental impacts;
12. Meet project needs in a cost-effective and timely manner; and,
13. Design and construct the project in conformance with SCE's current engineering, design, and construction standards for substation, transmission, subtransmission, and distribution system projects.

These objectives have guided SCE in developing a range of reasonable alternatives to Coolwater-Lugo, or to the location of Coolwater-Lugo, which would feasibly attain most of the basic project objectives.

## **1.4 Electrical System Alternatives**

System alternatives were developed as part of the serial and cluster generation interconnection study processes. This section describes the process SCE used to develop the system alternatives for Coolwater-Lugo and to select the system alternative for Coolwater-Lugo for recommendation to the CPUC and the BLM. This section provides a description of each system alternative (including the No Project Alternative) and discusses the ability of each of these system alternatives to meet Project objectives, purpose, and need. Also included is the rationale for either eliminating an alternative or carrying it forward. Substation site and transmission route alternatives are discussed in

---

<sup>1</sup> The proposed Desert View Substation would be initially constructed with only the facilities needed to support the transmission line from Coolwater to Lugo. Similar to SCE's Antelope Substation and Windhub Substation, SCE is seeking to license the full build out of Desert View Substation, which would include 500/220/115/12 kV facilities needed for anticipated load serving in the High Desert Region, particularly the Town of Apple Valley, reliability, and future generation interconnection purposes.

<sup>2</sup> See Garamendi Principles (Senate Bill 2431, Stats. 1988, Ch. 1457) regarding State transmission siting policies, including; 1) encourage the use of existing rights-of-way by upgrading existing transmission facilities where technically and economically justifiable; 2) when construction of new transmission lines is required, encourage expansion of existing right-of-way, when technically and economically feasible; 3) provide for the creation of new rights-of-way when justified by environmental, technical, or economic reasons as determined by the appropriate licensing agency; 4) where there is a need to construct additional transmission capacity seek agreement among all interested utilities on the efficient use of that capacity.

Chapter 2. CEQA does not require in-depth analysis of all potential system alternatives, but specifies that a reasonable range of system alternatives be considered and evaluated that will foster informed decision making and public participation.<sup>1</sup>

This section begins with a description of the approach to the initial system alternatives selection, discusses requirements of CEQA and NEPA, and then provides descriptions of system alternatives eliminated and retained for evaluation in this Proponent's Environmental Assessment ("PEA"). While the CAISO is responsible for providing open and non-discriminatory access to the CAISO controlled Grid in California, the CPUC retains exclusive jurisdiction over the siting of CAISO approved transmission projects within the State of California and is the lead agency with respect to such project elements within California under CEQA. Therefore, in the Application of which this PEA is a part, SCE seeks from the CPUC a Certificate of Public Convenience and Necessity ("CPCN") in accordance with CPUC General Order 131-D. If approved by the CPUC, the CPCN would identify the substation site and transmission route for Coolwater-Lugo, based on the environmental review of SCE's site and route alternatives, as required by CEQA, and would authorize construction of Coolwater-Lugo (including any modifications to the project approved by the CPUC), consistent with Public Utilities Code Section 1001. This PEA includes a detailed environmental analysis of SCE's Coolwater-Lugo, together with other information required by CPUC rules, in order to assist the CPUC in preparing its Initial Study of Coolwater-Lugo pursuant to CEQA. Also, since most of the Project Study Area is located on land under the jurisdiction of the BLM, SCE would need to file a ROW application separately with the BLM and obtain a permit to construct from the BLM.

Based on SCE's evaluation of Coolwater-Lugo's basic objectives and its potentially significant environmental effects, the principal Project system alternatives SCE has considered and evaluated below are:

- System Alternative 1 – Coolwater-Pisgah 220 kV Transmission Line
- System Alternative 2 – Rebuilding the Existing Kramer-Lugo 220 kV Transmission Lines
- System Alternative 3 – Reconductoring the Existing Kramer-Lugo 220 kV Transmission Lines
- System Alternative 4 – Kramer-Lugo No.3 220 kV Transmission Line
- System Alternative 5 – Kramer-Llano 500 kV Transmission Line
- System Alternative 6 – Kramer-Llano 500 kV Transmission Line and Rebuild of Lugo-Pisgah No.1 220 kV Transmission Line

---

<sup>1</sup> See CEQA Guidelines § 15126.6(a).

- System Alternative 7 – AV Clearview Transmission Proposal – Baseline Case
- System Alternative 8 – AV Clearview Transmission Proposal – Expanded Case
- System Alternative 9 - No Project Alternative

#### **1.4.1 System Alternative 1 – Coolwater-Pisgah 220 kV Transmission Line**

Description: A Coolwater-Pisgah 220 kV transmission line would require the acquisition of new ROW and the construction of approximately 28 miles of new double-circuit single-strung 220 kV transmission line from the existing Coolwater 220 kV Switchyard, located in Daggett, to Pisgah Substation, which is located east of Newberry Springs. This new Coolwater to Pisgah 220 kV transmission line path would redirect a portion of the power from Kramer Substation and the Coolwater 220 kV Switchyard southeast to Pisgah Substation and then west to Lugo Substation. This new transmission path would attempt to off-load the existing transmission capacity limited Kramer-Lugo No.1 and No.2 220 kV transmission lines in an effort to create additional transmission capacity.

Project Objectives, Feasibility, and Environmental Considerations: Due to the increased electrical path impedance associated with rerouting power from Kramer Substation and the Coolwater 220 kV Switchyard all the way east to Pisgah Substation and then back west to Lugo Substation, a Coolwater-Pisgah 220 kV transmission line would not alleviate the Kramer-Lugo No.1 and No.2 220 kV transmission line constraints. In fact, if additional resources are interconnected to the Pisgah Substation, this alternative would result in additional flows on the already constrained Kramer-Lugo 220 kV transmission lines.

Because a Coolwater-Pisgah 220 kV transmission line would not eliminate the existing Kramer to Lugo transmission capacity bottleneck, this alternative would not provide the additional transmission system capacity to interconnect and integrate new generation resources that ultimately require transmission capacity south of Kramer and allow compliance with California's RPS (Objective 1 – Facilitate SCE and other California utilities achievement of California's RPS). Alternative 1 would not provide the necessary transmission capacity to fully integrate the ~~250~~275 MW generation project seeking interconnection in the Barstow area and additional future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas (Objective 2 – Provide transmission that would facilitate the full delivery a ~~250~~ 275 MW renewable generation project and future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas) or facilitate the interconnection of CREST, Re-MAT, and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects). In addition, this alternative does not facilitate the Department of Defense meeting their Energy Mandate of producing or procuring 25% of their total energy from renewable energy sources beginning in 2025 (Objective 7 – Facilitate the Department of Defense meeting their Energy Mandate) or address transmission capacity concerns from the City of Ridgecrest

(Objective 8 – Address transmission capacity concerns from the City of Ridgecrest). Finally, this alternative does not site a new Desert View Substation to facilitate load serving, reliability, and future generation interconnections (Objective 9 – Site a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections ~~provide reliability and support load growth in the Apple Valley area~~). Because System Alternative 1 fails to achieve most of the basic Coolwater-Lugo objectives, it was eliminated from further consideration.

#### **1.4.2 System Alternative 2 – Rebuilding the Existing Kramer-Lugo 220 kV Transmission Lines**

Description: Rebuilding the existing 220 kV lines between the existing Kramer and Lugo Substations would involve tearing down and removing the existing 220 kV facilities and replacing them with higher capacity 220 kV or 500 kV facilities. Rebuilding the existing Kramer-Lugo 220 kV lines with 220 kV facilities would not involve the expansion of Kramer Substation and would be developed within existing ROW. However, rebuilding the Kramer-Lugo 220 kV lines with 500 kV facilities would require approximately 92 additional acres to accommodate for the full build-out of a standard SCE designed 500/220 kV substation. Facilities to support a new Kramer-Lugo 500 kV transmission line would require a 500 kV operating bus, a 500/220 kV transformer bank, a Mechanical Electrical Equipment Room (“MEER”), and the installation of additional ancillary equipment including but not limited to circuit breakers, disconnect switches, conductor, and system protection. The acquisition of new ROW around Kramer Substation and Lugo Substation would also be required to route the new 500 kV line from the existing Kramer-Lugo corridor to the 500 kV buses at Kramer and Lugo Substations.

Project Objectives, Feasibility, and Environmental Considerations: Rebuilding the Kramer-Lugo 220 kV transmission lines with higher capacity 220 kV or 500 kV facilities would require the complete removal of the existing 220 kV facilities (approximately 48 miles) and the installation of new higher capacity 220 kV or 500 kV facilities. However, SCE is precluded from taking a long-term outage on both the Kramer-Lugo No.1 and No.2 220 kV transmission lines in order to rebuild them due to RPS, financial, reliability, and load serving concerns.

Under the outage of both the Kramer-Lugo No.1 and No.2 220 kV transmission lines, there would be insufficient transmission capacity for the existing 1,729<sup>1</sup> MW of Kramer area generation. Consequently, significant amounts of the Kramer area generation would need to be curtailed to maintain a balance between local area load and generation. Since most generation in the Kramer area is renewable in nature, this prolonged curtailment of renewable resources would negatively impact SCE’s RPS requirements. Moreover, over 900 MW of generation resources in the North of Kramer area have qualified facilities contracts in place with SCE and SCE could be required to pay these generators for lost production during a prolonged outage, which would cause an unnecessary financial

<sup>1</sup> <http://www.caiso.com/Documents/AppendixABoardApproved2012-2013TransmissionPlan.pdf>

burden to SCE ratepayers. Furthermore, system reliability could not be guaranteed under the long term outage of both the Kramer-Lugo No.1 and No.2 220 kV transmission lines because SCE would be unable to mitigate certain additional single or double contingency outages while in this system condition. Single contingency outages on the 115 kV subtransmission lines between the Kramer and Victor Substations or on the Kramer No.1 or No.2 220/115 kV transformers would cause thermal overloads on some of the remaining local facilities. In addition, a double contingency outage on both 115 kV subtransmission lines, supported on a common structure, between Kramer and Victor Substations would effectively disconnect the entire Kramer Area from the rest of the SCE system causing the Kramer area transmission system to become unstable, resulting in localized blackouts thereby jeopardizing SCE's ability to provide reliable load service.

Because SCE cannot take a long term outage on both 220 kV lines to remove and rebuild them due to reasons stated above, System Alternative 2 could not be developed unless there was an already established alternative transmission system between Kramer and Lugo Substations that could reliably serve load<sup>1</sup> (such as the system proposed by Coolwater-Lugo). Thus, this alternative would not allow compliance with California's RPS (Objective 1 – Facilitate SCE and other California utilities achievement of California's RPS) or support California's GHG reduction program (Objective 4 – Support California's GHG reduction program) because it would require the curtailment of renewable resources. Alternative 2 would not interconnect and integrate the 250275 MW generation project seeking interconnection in the Barstow area and additional future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas (Objective 2 – Provide transmission that would facilitate the full delivery of a 250275 MW renewable generation project and future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas), would not facilitate the interconnection of CREST and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects), would not facilitate the Department of Defense meeting their Energy Mandate of producing 25% of their total energy from renewable energy sources (Objective 7 – Facilitate the Department of Defense meeting their Energy Mandate), or address transmission capacity concerns from the City of Ridgecrest (Objective 8 – Address City of Ridgecrest transmission capacity concerns) because this alternative is not able to be

---

<sup>1</sup> Pursuant to Cal. Pub. Util. Code § 451 "Every public utility shall furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities, including telephone facilities, as defined in Section 54.1 of the Civil Code, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public." Further, Cal. Pub. Util. Code § 330 (g) provides that "Reliable electric service is of utmost importance to the safety, health, and welfare of the state's citizenry and economy. It is the intent of the Legislature that electric industry restructuring should enhance the reliability of the interconnected regional transmission systems, and provide strong coordination and enforceable protocols for all users of the power grid." Generally, the CPUC provides the following language in regards to a utility's obligation to serve: "The utilities' obligation to serve their customers is mandated by state law and is part and parcel of the entire regulatory scheme under which the utilities received a franchise and under which the CPUC regulates utilities under the Public Utilities Act. (See, e.g., Pub. Util. Code §§ 451, 761, 762, 768, and 770)"

constructed without an established alternative transmission system between Kramer and Lugo Substations in place.

Moreover, Alternative 2 would not comply with applicable reliability planning criteria required by the CAISO, the NERC, and the WECC (Objective 3 – Comply with all applicable reliability planning criteria) and would not construct facilities in a manner which would maintain reliable electric service and minimize service interruptions during construction (Objective 10 construct facilities to maintain reliable electric service and minimize service interruptions). ~~Finally, Alternative 2 would not site a new Desert View Substation to facilitate load serving, reliability, and future generation interconnections (Objective 9 – Site a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections provide reliability, and support load growth and generation interconnections in the Apple Valley area).~~

In addition, future expansion of Kramer Substation with 500 kV facilities may not be possible due to Caltrans’ proposed State Route 58 (“SR-58”) Kramer Junction Expressway Project.<sup>1</sup> This proposed Caltrans Project would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website.<sup>2</sup> All of these four alternatives would negatively impact the expansion of Kramer Substation to 500 kV and/or possible line routing to Kramer Substation. These complications would delay Coolwater-Lugo’s operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Because System Alternative 2 fails to achieve most of the basic Coolwater-Lugo objectives, it was eliminated from further consideration.

### **1.4.3 System Alternative 3 – Reconductoring the Existing Kramer-Lugo 220 kV Transmission Lines**

Description: Reconductoring the existing 220 kV lines between the Kramer and Lugo Substations would involve replacing the existing low capacity conductor with new higher capacity conductor.

Project Objectives, Feasibility, and Environmental Considerations: The existing Kramer-Lugo No.1 and No.2 220 kV transmission lines are strung with 1,033 kcmil ACSR conductor and the existing tower structures are not designed to accommodate SCE’s current standard design 220 kV higher capacity conductor, which is two bundled 1,590 kcmil ACSR (2B-1590 ACSR). Reconducting the existing 220 kV transmission lines

<sup>1</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>2</sup>

[http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

with 1,590 kcmil ACSR would equate to a complete tear down and rebuild, which is explained in System Alternative 2.

However, the existing lines could be reconducted with new high temperature low sag conductor that would have similar mechanical properties (weight, tension, cross-sectional area, etc.) as the existing 220 kV lines in order to accommodate the existing transmission tower structural limitations. High temperature low sag conductor, such as Curlew 1,033 kcmil aluminum conductor steel supported (“ACSS”) conductor, has a higher allowable ampacity than ACSR conductor, but the resistance, reactance, and line charging characteristics of ACSS conductor are essentially equivalent to ACSR conductor. Use of ACSS conductor would therefore result in increased power flows without improvements to voltage stability or dynamic stability due to an increased voltage phase angle. Since the Kramer area is also a stability limited transmission area, a Special Protection System is currently in place to mitigate against this concern which would occur under certain local single and double contingency outages. Reconducting the existing Kramer-Lugo No.1 & No.2 220 kV transmission lines with high temperature low sag conductor would degrade the voltage and stability performance below existing conditions, which would increase the chance of the Kramer area transmission system going unstable under certain outages, resulting in localized black outs and thereby jeopardizing SCE’s ability to provide reliable load service. In addition, one Kramer-Lugo 220 kV transmission line cannot be reconducted while the remaining line is left in-service due to concerns over safe working clearances. As explained in System Alternative 2, SCE is precluded from taking a long-term outage on both the Kramer-Lugo No.1 and No.2 220 kV transmission lines in order to rebuild them due to RPS, financial, reliability, and load serving concerns.

Because the existing Kramer-Lugo 220 kV structures cannot support SCE’s current standard design 220 kV higher capacity conductor and because SCE cannot take a long term outage on both 220 kV lines to remove and rebuild them due to reasons stated above in the System Alternative 2 explanation, System Alternative 3 could not be developed unless there was an already established alternative transmission system between Kramer and Lugo Substations that could reliably serve load<sup>1</sup>, such as the system proposed by Coolwater-Lugo. Thus, this alternative would not allow compliance with California’s RPS (Objective 1 – Facilitate SCE and other California utilities achievement of California’s RPS) or support California’s GHG reduction program (Objective 4 – Support

---

<sup>1</sup> Pursuant to Cal. Pub. Util. Code § 451 "Every public utility shall furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities, including telephone facilities, as defined in Section 54.1 of the Civil Code, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public." Further, Cal. Pub. Util. Code § 330 (g) provides that "Reliable electric service is of utmost importance to the safety, health, and welfare of the state's citizenry and economy. It is the intent of the Legislature that electric industry restructuring should enhance the reliability of the interconnected regional transmission systems, and provide strong coordination and enforceable protocols for all users of the power grid." Generally, the CPUC provides the following language in regards to a utility's obligation to serve: "The utilities' obligation to serve their customers is mandated by state law and is part and parcel of the entire regulatory scheme under which the utilities received a franchise and under which the CPUC regulates utilities under the Public Utilities Act. (See, e.g., Pub. Util. Code §§ 451, 761, 762, 768, and 770)"

California's GHG reduction program) because it would require the curtailment of renewable resources. Alternative 3 would not interconnect and integrate the ~~250~~275MW generation project seeking interconnection in the Barstow area and additional future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas (Objective 2 – Provide transmission that would facilitate the full delivery a ~~250~~275MW renewable generation project and future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Apple Valley, and Owens Valley areas), would not facilitate the interconnection of CREST and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects), would not facilitate the Department of Defense meeting their Energy Mandate of producing 25% of their total energy from renewable energy sources (Objective 7 – Facilitate the Department of Defense meeting their energy mandate), or address transmission capacity concerns from the City of Ridgecrest (Objective 8 – Address City of Ridgecrest transmission capacity concerns) because this alternative is not able to be constructed without an established alternative transmission system between Kramer and Lugo Substations in place.

Moreover, Alternative 3 would not comply with applicable reliability planning criteria required by the CAISO, the NERC, and the WECC (Objective 3 – Comply with all applicable reliability planning criteria) and would not construct facilities in a manner which would maintain reliable electric service and minimize service interruptions during construction (Objective 10 construct facilities to maintain reliable electric service and minimize service interruptions) due to the extended outage required for construction and because use of high temperature low sag conductor would result in degraded voltage stability and dynamic stability characteristics. ~~Finally~~, Alternative 3 would not include a new Desert View Substation to facilitate load serving, reliability, and future generation interconnections (Objective 9 – License a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections ~~provide reliability, and support load growth and generation interconnections in the Apple Valley area~~).

In addition, Caltrans' proposed SR-58 Kramer Junction Expressway Project<sup>1</sup> would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>2</sup>. All of these four alternatives would negatively impact possible line routing to Kramer Substation under this system alternative. These complications would delay Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Because System Alternative 3 fails to achieve most of the basic Coolwater-Lugo objectives, it was eliminated from further consideration.

<sup>1</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>2</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

#### 1.4.4 System Alternative 4 – Kramer-Lugo No.3 220 kV Transmission Line

Description: Installing a new Kramer-Lugo No.3 220 kV transmission line parallel to the existing Kramer-Lugo No.1 and No.2 transmission lines would involve expanding the existing ROW and the construction of approximately 48 miles of new double-circuit single-strung 220 kV transmission line from the existing Kramer Substation to the existing Lugo Substation. Due to approximately 18 miles of structures located on either side of the ROW from the City of Adelanto south to the City of Hesperia, a new Kramer-Lugo No.3 220 kV transmission line would require new ROW that may already be encumbered with residential and/or commercial buildings.

Project Objectives, Feasibility, and Environmental Considerations: A new Kramer-Lugo No. 3 220 kV line could integrate new generation resources in the Barstow, Inyokern, Kramer, and Owens Valley areas, but would not integrate future generation resources in the Lucerne Valley area (Objective 2 – Provide transmission that would facilitate the full delivery of future generation resources in the Lucerne Valley/future Jasper Substation and Apple Valley areas). ~~In addition,~~ Alternative 4 would not include a future multipurpose 500/220/115/12 kV Desert View Substation to facilitate load serving, reliability, and future generation interconnections (Objective 9 – License a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections). ~~Finally,~~ The development of a contiguous route between Kramer and Lugo Substations may not be achievable due to approximately 18 miles of obstructions along the existing ROW from the City of Adelanto to the City of Hesperia. As a result, a new Kramer-Lugo No.3 220 kV transmission line would most likely not meet the project needs in a cost effective or timely manner due to requiring new ROW that may already be encumbered with residential and/or commercial buildings (Objective 12 – Meet project needs in a cost-effective and timely manner).

In addition, Caltrans' proposed SR-58 Kramer Junction Expressway Project<sup>1</sup> would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>2</sup>. All of these four alternatives would negatively impact possible line routing to Kramer Substation under this system alternative. These complications would delay Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Therefore, System Alternative 4 was eliminated from further consideration.

---

<sup>1</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>2</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

### 1.4.5 System Alternative 5 – Kramer-Llano 500 kV Transmission Line

Description: A Kramer-Llano 500 kV transmission line alternative would include expansion of the existing Kramer Substation with 500 kV facilities, a new 40-mile single-circuit 500 kV transmission line, a new 500 kV switching station near the City of Llano, and new telecommunication facilities. Expansion of the existing Kramer Substation with 500 kV facilities would require approximately 92 additional acres adjacent to the existing Kramer Substation to accommodate for the full build-out of a standard SCE designed 500/220 kV substation. Facilities to support a new Kramer-Llano 500 kV transmission line would require a 500 kV operating bus, a 500/220 kV transformer bank, a MEER, and the installation of additional ancillary equipment including but not limited to circuit breakers, disconnects, conductor, and system protection. In addition, this substation expansion would require the relocation of approximately two miles of the existing Kramer-Rocket Test 115 kV subtransmission line on expanded or new ROW.

A new Kramer-Llano 500 kV transmission line would require new or expanded ROW from Kramer Substation, south along the west side of Highway 395 for approximately 12 miles. The new 500 kV transmission line would then turn southwest towards Lake Los Angeles for approximately 16 miles and then turn directly south for approximately 12 miles on new ROW to interconnect into a new 500 kV switching station tentatively called Llano. This new Llano Switching Station would be connected to the system by looping one or both of the existing Lugo-Vincent 500 kV transmission lines to provide a system connection for the new 500 kV transmission line from Kramer Substation, in order to create a new electrical path from Kramer Substation to the existing Lugo and Vincent substations. A new Llano Switching Station would require approximately 9 acres of land for a 500 kV switch rack, a MEER, and the installation of additional ancillary equipment including but not limited to circuit breakers, disconnects, conductor, and system protection together with telecommunications needed for the system protection.

Because the Kramer-Llano 500 kV transmission line would be located in a different area than the proposed Coolwater-Lugo, Alternative 5 would require substantially greater new telecommunication facilities to support line protection and associated SPS than Coolwater-Lugo. Alternative 5 would require approximately 48 miles of new fiber-optic cable between Llano Switching Station and Lugo Substation requiring approximately 128 new poles, and approximately 80 miles of new fiber-optic cable between Llano Switching Station and Vincent Substation requiring approximately 195 new poles<sup>1</sup>. The installation of these fiber-optic structures would require an undetermined amount of new roads, grading, and laydown areas. In addition, new microwave antennas would need to be installed at the new Llano Switching Station and the existing Frost Peak communication site in Wrightwood, California.

Project Objectives, Feasibility, and Environmental Considerations: A new Kramer-Llano 500 kV transmission line, new 500 kV facilities at existing Kramer Substation, a new

---

<sup>1</sup> As estimated in the CAISO Transition Cluster Phase II Interconnection Study Report for SCE's East of Lugo Bulk System

Llano 500 kV Switching Station, and new telecommunication facilities could integrate new generation resources in the Barstow, Inyokern, Kramer, and Owens Valley areas, but would not integrate future generation resources in the Lucerne Valley area (Objective 2 - Provide transmission that would facilitate the full delivery of future generation resources in the Lucerne Valley/future Jasper Substation and Apple Valley areas).

Furthermore, System Alternative 5 would not facilitate the interconnection of CREST and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects), or address transmission capacity concerns from the City of Ridgecrest (Objective 8 – Address transmission capacity concerns from the City of Ridgecrest), or meet the project needs in a timely manner (Object 12 – Meet project needs in a timely manner). Objectives 6, 8, and 12 would not be achieved because System Alternative 5 would significantly delay Coolwater-Lugo operating date due to the additional environmental work, agency approvals, and engineering that would be required. Since this alternative is located outside of the Coolwater-Lugo Study Area, it would require SCE to perform a siting process to identify and evaluate potential routing alternatives. This process typically takes approximately six to eight months prior to the development of Proponent’s Environmental Assessment (“PEA”). This delay would negatively affect multiple large and small renewable generation requests currently queued in the CAISO and SCE generation interconnection queues, in addition to the ~~250~~275MW Barstow area renewable generation project, currently under construction, that are all seeking interconnection into SCE’s North of Kramer electrical area. By delaying the necessary transmission required for these project interconnections, System Alternative 5 would negatively affect the ability of these queued projects to negotiate PPAs due to delayed commercial operating dates and would also negatively impact the resource adequacy status and PPA obligations of the ~~250~~275MW Barstow area renewable generation project. SCE is obligated to make a best effort with meeting the operating dates in generation interconnection agreements so that generation developer resource adequacy status or obligations under PPAs are not jeopardized. In addition, this extended delay for transmission capacity in the North of Kramer electrical area could lead to complaints filed with the CPUC against SCE for unfairly prohibiting renewable generation interconnection under the Feed-in Tariff program, and/or the CSI, or the NHSP.

Moreover, because transmission facilities for Alternative 5 would be located on the west side of the Highway 395, this alternative would not include a new Desert View Substation southeast of the Town of Apple Valley (Objective 9 - License a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections ~~provide reliability, and support load growth and generation interconnections in the Apple Valley area~~). Alternative 5 would also not minimize environmental impacts or utilize the route that would minimize environmental impacts (Objective 11 – Minimize environmental impacts and utilize the shortest route that minimizes environmental impacts). A Kramer-Llano 500 kV transmission line alternative would require approximately 92 acres of additional land disturbance and associated environmental impacts to expand Kramer Substation with 500 kV facilities, approximately nine acres of additional land disturbance and environmental impacts for a Llano 500 kV Switching Station, approximately six more miles of transmission line facilities on new or expanded ROW, approximately two miles of additional new or

expanded ROW for relocation of an existing subtransmission line, and approximately 128 miles of additional fiber-optic telecommunication facilities, due to lack of adequate telecommunication on the existing Lugo-Vincent No.1 and No.2 500 kV transmission lines requiring approximately 323 new poles and an undetermined amount of new roads, grading, and laydown areas.

In addition, future expansion of Kramer Substation with 500 kV facilities may not be possible due to Caltrans' proposed SR-58 Kramer Junction Expressway Project.<sup>1</sup> This proposed Caltrans Project would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>2</sup>. All of these four alternatives would negatively impact the expansion of Kramer Substation to 500 kV and/or possible line routing to Kramer Substation. These complications would delay Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Finally, the Coolwater-Lugo 220 kV transmission line was included in the CAISO's 2010-2011<sup>3</sup>, and 2011-2012<sup>4</sup>, 2012-2013<sup>5</sup>, and 2013-2014<sup>6</sup> Transmission Plans, but the CAISO determined System Alternative 5 was not needed and therefore not modeled in their 2010-2011 or 2011-2012 Transmission Plans. Since System Alternative 5 fails to achieve most of the basic Coolwater-Lugo objectives, this alternative was eliminated from further consideration.

#### **1.4.6 System Alternative 6 – Kramer-Llano 500 kV Transmission Line and Rebuild of Lugo-Pisgah No.1 220 kV Transmission Line**

Description: System Alternative 6 would include all of the facilities described in System Alternative 5 plus rebuilding the existing Lugo-Pisgah No.1 220 kV transmission line with 220 kV and 500 kV construction, installation of a new third 500/220 kV transformer bank at Lugo Substation, and siting of a new multipurpose Desert View Substation southeast of the Town of Apple Valley. Rebuilding the Lugo-Pisgah No.1 220 kV transmission line would involve removing and replacing 67 miles of the existing 220 kV transmission line with higher capacity conductor on 220 kV and 500 kV structures that would initially be operated at 220 kV within existing or mostly existing ROW. In

<sup>1</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>2</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

<sup>3</sup> [http://www.aiso.com/Documents/110518Decision\\_TransmissionPlan-RevisedDraftPlan.pdf](http://www.aiso.com/Documents/110518Decision_TransmissionPlan-RevisedDraftPlan.pdf)

<sup>4</sup> [http://www.aiso.com/Documents/Decision\\_2011-12TransmissionPlan-Plan-MAR2012.pdf](http://www.aiso.com/Documents/Decision_2011-12TransmissionPlan-Plan-MAR2012.pdf)

<sup>5</sup> <http://www.aiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

<sup>6</sup> <http://www.aiso.com/Documents/RevisedDraft2013-2014TransmissionPlan.pdf>

addition, rebuilding the Lugo-Pisgah No.1 220 kV transmission line would involve the removal of approximately 16 miles of the existing Lugo-Pisgah No.2 220 kV transmission line, from Lugo Substation to the proposed Desert View Substation, and termination of the remaining portion of the Lugo-Pisgah No.2 220 kV transmission line into proposed Desert View Substation. The removal of approximately 16 miles of the existing Lugo-Pisgah No.2 220 kV transmission line would be required to create the necessary space within the existing ROW for the 500 kV constructed, 220 kV operated, structures between the proposed Desert View Substation and Lugo Substation for the rebuilt Lugo-Pisgah No.1 220 kV transmission line.

Project Objectives, Feasibility, and Environmental Considerations: A new Kramer-Llano 500 kV transmission line and a rebuilt Lugo-Pisgah No.1 220 kV transmission line, installation of a third 500/220 kV transformer at Lugo Substation, and siting a multipurpose Desert View Substation could integrate new generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas and is a viable alternative from an electrical standpoint.

However, this alternative was eliminated from further consideration for the reasons explained under System Alternative 5 (greater amount of new telecommunication facilities, timing of siting and environmental review, lack of facilitation of CREST and Rule 21 projects, lack of support for a new multipurpose substation in the Town of Apple Valley area). In addition to those reasons, Alternative 6 would require approximately 39 additional miles of removed and rebuilt 220 kV transmission line than Alternative 5 on existing or expanded ROW, from the Lucerne Valley area east to Pisgah Substation, which would not minimize environmental impacts or utilize the route that would minimize environmental impacts (Objective 11 – Minimize environmental impacts and utilize the shortest route that minimizes environmental impacts). Alternative 6 would also not meet the cost goals of Objective 12 (Objective 12 - Meet project needs in a cost-effective manner) because it would increase Coolwater-Lugo costs approximately 50 percent<sup>1</sup> due to the extra facilities required beyond that of Coolwater-Lugo which would be an unnecessary burden to SCE ratepayers.

In addition, future expansion of Kramer Substation with 500 kV facilities may not be possible due to Caltrans' proposed SR-58 Kramer Junction Expressway Project.<sup>2</sup> This proposed Caltrans Project would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>3</sup>. All of these four alternatives would negatively

---

<sup>1</sup> Cost comparison based on costs identified in the Q125 Abengoa Mojave Solar system impact study, the transition cluster phase II North of Lugo group report, and SCE's per unit cost guide available at: [http://www.caiso.com/Documents/SCE\\_2012FinalPerUnitCostGuide.xls](http://www.caiso.com/Documents/SCE_2012FinalPerUnitCostGuide.xls)

<sup>2</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>3</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

impact the expansion of Kramer Substation to 500 kV and/or possible line routing to Kramer Substation. These complications would delay Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

#### **1.4.7 System Alternative 7 – AV Clearview Transmission Proposal – Baseline Case**

Description: System Alternative 7 is the AV Clearview Transmission Proposal's Baseline Case as submitted by Critical Path Transmission, LLC, for consideration in the CAISO's 2012-2013 Annual Transmission Plan.

As described in the CAISO's 2012-2013 Annual Transmission Plan, Critical Path Transmission, LLC's AV Clearview Baseline Case consists of the following transmission elements:

- New 230 kV Yeager Substation;
- New double circuit 230 kV from Windhub to Yeager;<sup>1</sup>
- New double circuit 230 kV from Yeager to Kramer;
- New 230/115 kV step down transformer bank at Yeager;
- New single circuit 115 kV from Yeager to SCE Edwards 115 kV Substation with line operated as normally open at Edwards;<sup>2</sup>
- New 500 kV Tucker Substation;<sup>3</sup>
- Loop Lugo-Vincent No.1 and No.2 500 kV transmission lines through Tucker Substation; and, new 1,000 MW capacity underground DC line between Yeager and Tucker Substations.

Figure 1.0-A below shows the Baseline Case configuration:

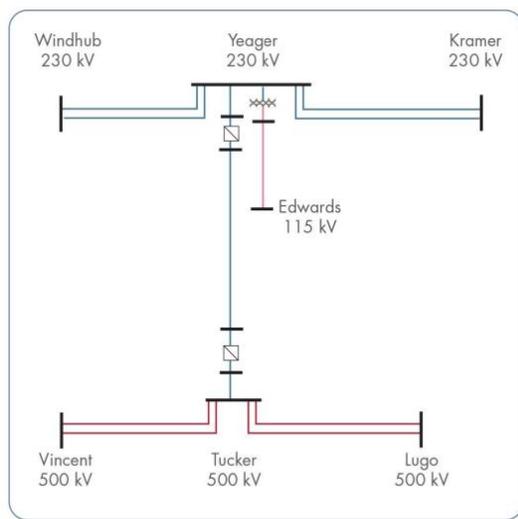

---

<sup>1</sup> Required upgrades at SCE's Windhub Substation to accommodate new double-circuit 230 kV line are not described in the CAISO's 2012-2013 Annual Transmission Plan

<sup>2</sup> Upgrades at Edwards, such as a complete substation rebuild, may be required to accommodate the proposed 115 kV line and are not described in the CAISO's 2012-2013 Annual Transmission Plan

<sup>3</sup> Required telecommunications to new Tucker Substation necessary to provide proper line protection once existing Lugo – Vincent 500 kV transmission lines are looped in are not described in the CAISO's 2012-2013 Annual Transmission Plan

Figure 1.0-A AV Clearview Baseline Case<sup>1</sup>

The AV Clearview Proposal was analyzed in the CAISO's 2012-2013<sup>2</sup> Transmission Plan and the CAISO determined that this Proposal did not produce economic benefits that would offset the higher costs of the project relative to Coolwater-Lugo and was therefore not modeled in their 2012-2013 Transmission Plan.

Project Objectives, Feasibility, and Environmental Considerations: The AV Clearview Proposal's Baseline Case would not be able to integrate new generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas (Objective 2 - Provide transmission that would facilitate the full delivery of future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas) because it could not be implemented in a cost effective and timely manner due to existing system limitations. Potential environmental impacts for the Baseline Case are not known; however, it should be noted that new ROW, new substations, and substation expansions would be required on currently undisturbed lands.

The first existing system limitation is associated with Windhub Substation availability to accommodate the interconnection of the proposed double-circuit 220 kV transmission line from AV Clearview's proposed Yeager Substation. With all generation interconnection requests to the Windhub 220 kV Switchrack, there would be no available space for the AV Clearview Proposal's Baseline Case. Such a proposed interconnection would require Windhub Substation to be expanded, which may impact newly installed wind generation and generation tie-line facilities that support recently interconnected wind projects. This necessary expansion would also require acquisition of land controlled by generation developers.

<sup>1</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

<sup>2</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

In addition, the connection of the two proposed transmission lines to Windhub Substation under the Baseline Case would result in significant short-circuit duty issues. Specifically, this alternative would exceed SCE's maximum short-circuit duty design at Windhub Substation. To address the short-circuit duty limitation, significant and costly actions, such as the complete demolition of the existing 220 kV switchrack and the construction of new Gas Insulated Switchgear ("GIS") 220 kV facilities with increased 80 kA short-circuit duty rating would be necessary. Upgrading Windhub Substation for short-circuit duty issues would require extremely long-term curtailment of recently interconnected generation resources. These curtailments could potentially cause significant monetary losses to the recently interconnected wind generation projects as well as result in a reduction to the overall renewable energy production while the upgrade is implemented, thereby adversely impacting RPS target goals (Objective 1 – Facilitate SCE and other California utilities achievement of California's RPS) and creating costs in excess of \$100 million of otherwise unnecessary work to convert Windhub's existing 220 kV Switchrack to GIS (Objective 12 – meet project needs in a cost-effective and timely manner). Furthermore, the required curtailments of the Tehachapi area renewable generation connecting to and around Windhub Substation would require replacement generation which may not come from renewable resources, and which may not support California's GHG Reduction Program (Objective 4 – Support California's GHG Reduction Program).

Moreover, this proposal would not meet applicable CAISO, NERC and WECC planning criteria (Objective 3 – Comply with all applicable reliability planning criteria) as demonstrated by the CAISO's analysis of the AV Clearview Proposal in their 2012-2013 Annual Transmission Plan<sup>1</sup>. The analysis indicated that the proposed connection from Yeager to SCE's Edwards Substation would result in overloads on the proposed Yeager-Edwards 115 kV line, the existing Edwards-Holgate 115 kV line, and the existing Kramer-Holgate 115 kV line. The CAISO's proposed mitigation for these overloads was to leave the proposed Yeager-Edwards 115 kV line open; however, this operating condition would result in this line having the sole purpose of providing energy redundancy for Edwards Air Force Base ("AFB")<sup>2</sup>. SCE's review of outage history has revealed that the existing 115 kV line serving Edwards AFB has not experienced a prolonged outage in the last ten years. All outages have been categorized as "open and reclose" operations and have thus been minimal in duration. Any proposed "energy redundancy" aspects would therefore not exist since the proposed line would be operated normally open and would close only upon loss of the existing 115 kV line. As such, the exact same outage duration would be experienced with or without AV Clearview's proposed Yeager-Edwards 115 kV line. Consequently, the Yeager-Edwards 115 kV line provides no real measurable benefit and has not been identified to be required in any of the load serving studies that have been performed as part of the CAISO's 2012-2013 Annual Transmission Plan. Furthermore, since the existing SCE Edwards Substation does not have a 115 kV switchrack, the proposed Yeager-Edwards 115 kV line would require a complete rebuild of Edwards Substation and the construction of an Edwards 115 kV

<sup>1</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

<sup>2</sup> <http://www.caiso.com/Documents/CriticalPathCommentsDraft2012-2013TransmissionPlan.pdf>

Switchrack, which would also not meet Objective 12 (Objective 12 – meet project needs in a cost-effective and timely manner).

System Alternative 7 would also not facilitate the interconnection of CREST and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects), address transmission capacity concerns from the City of Ridgecrest (Objective 8 – Address transmission capacity concerns from the City of Ridgecrest), or meet the project needs in a timely manner (Object 12 – Meet project needs in a timely manner) due to the lack of space on the Windhub 220 kV Switchrack to accommodate AV Clearview’s proposed connection from Yeager due to the short-circuit duty concerns from such a connection as described above and due to the need to rebuild SCE’s Edwards Substation. Objectives 6, 8, and 12 would not be achieved because System Alternative 7 would significantly delay the operating date due to the additional environmental review, agency approvals, and engineering that would be needed for construction of the AV Clearview Proposal, the required substation rebuilds that would be necessary at SCE’s Windhub and Edwards Substations, and any other necessary reliability upgrades in the SCE system that would be required as a result of the AV Clearview proposal.

This delay would negatively affect multiple large and small renewable generation requests currently in the CAISO and SCE generation interconnection queues, in addition to the ~~250~~275MW Barstow area renewable generation project, currently under construction, that are all seeking interconnection into SCE’s North of Kramer electrical area. By delaying the necessary transmission required for these project interconnections, System Alternative 7 would negatively affect the ability of these queued projects to negotiate PPAs due to delayed commercial operating dates, and would also negatively impact the resource adequacy status and PPA obligations of the ~~250~~275MW Barstow area renewable generation project. SCE is obligated to make a best effort with meeting the operating dates in generation interconnection agreements so that generation developer resource adequacy status or obligations under PPAs are not jeopardized. In addition, this extended delay for transmission capacity in the North of Kramer electrical area could lead to complaints filed with the CPUC against SCE for unfairly prohibiting renewable generation interconnection under the Feed-in Tariff program, and/or the CSI, or the NHSP.

Moreover, because the transmission facilities for Alternative 7 would be located on the west side of Highway 395, this alternative would not include a new Desert View Substation southeast of the town of Apple Valley (Objective 9 - License a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections ~~provide reliability, and support load growth and generation interconnections in the Apple Valley area~~). Alternative 7 would also not minimize environmental impacts or utilize the route that would minimize environmental impacts (Objective 11 – Minimize environmental impacts and utilize the shortest route that minimizes environmental impacts). The AV Clearview Proposal alternative would require approximately 84 miles of new transmission facilities on primarily new or

expanded ROW, approximately 40 miles of which would be underground<sup>1</sup>. Underground transmission facilities usually involve a combination of trenching and tunneling and the installation of cooling equipment, splice vaults, and underground ducts. Undergrounding, as opposed to overhead construction, would result in more severe impacts to air quality from emission from construction equipment, could disturb cultural resources and potentially hazardous waste (e.g., mining waste) buried at shallow depths, and could also create noise and vibration, potentially affecting nearby structures, protected species, surface and groundwater resources and deeply buried geological and paleontological features. Additional land disturbance and environmental impact would also be required to rebuild Edwards 115 kV Substation, and to provide for Fiber-Optic telecommunication facilities. Because Alternative 7 would be located in a different area than the proposed Coolwater-Lugo, it may require substantially greater new telecommunication facilities to support line protection and possibly an SPS than Coolwater-Lugo. Alternative 7 could require approximately 128 miles of new Fiber-Optic cable between Lugo Substation and Vincent Substation requiring approximately 323 new poles<sup>2</sup>. The installation of these Fiber-Optic structures would require an undetermined amount of new roads, grading, and laydown areas. In addition, new microwave antennas may need to be installed at the proposed Tucker Substation and the existing Frost Peak communication site in Wrightwood, California.

In addition, Caltrans' proposed SR-58 Kramer Junction Expressway Project<sup>3</sup> would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>4</sup>. All of these four alternatives would negatively impact possible line routing to Kramer Substation under this system alternative. These complications would delay

---

<sup>1</sup> While Critical Path Transmission, LLC, has stated in the CAISO 2012-2013 Annual Transmission Plan that the DC transmission line between Yeager and Tucker Substations will be built underground, they have not identified whether the transmission and subtransmission lines from Yeager Substation to Edwards, Windhub, and Kramer Substations will be overhead or underground and it is assumed these will be overhead. Based on information at criticalpathtransmission.com and from the AV Clearview map routes contained in the CAISO's 2012-2013 Annual Transmission Plan, it is estimated that the AV Clearview Transmission Proposal will require approximately 40 miles of new underground transmission line between Yeager and Tucker Substations, approximately 42 miles of new transmission line connecting Windhub, Yeager and Kramer Substations, and two miles of new subtransmission line between Yeager and Edwards Substation. It is estimated that approximately only two miles of the 84 miles of the new subtransmission and transmission required by the AV Clearview Transmission Proposal will be within an existing energy corridor.

<sup>2</sup> As compared to the Kramer-Llano 500 kV upgrade as estimated in the CAISO Transition Cluster Phase II Interconnection Study Report for SCE's East of Lugo Bulk System

<sup>3</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>4</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Since System Alternative 7 fails to achieve most of the basic Coolwater-Lugo objectives, this alternative was eliminated from further consideration. Additional SCE comments on the AV Clearview Proposal are located on the CAISO's 2012-2013 Transmission planning process webpage<sup>1</sup>.

### **1.4.8 System Alternative 8 – AV Clearview Transmission Proposal – Expanded Case**

Description: System Alternative 8 is the AV Clearview Transmission Proposal's Expanded Case as submitted by Critical Path Transmission, LLC, for consideration in the CAISO's 2012-2013 Annual Transmission Plan.

As described in the CAISO's 2012-2013 Annual Transmission Plan, Critical Path Transmission, LLC's AV Clearview Expanded Case consists of the following transmission elements instead of the elements discussed in the Baseline Case:

- New 500 kV Yeager Substation;
- New double circuit 500 kV from Windhub to Yeager;
- New double circuit 500 kV from Yeager to Kramer<sup>2</sup>;
- New 500/115 kV step down transformer bank at Yeager;
- New single circuit 115 kV from Yeager to SCE Edwards 115 kV Substation with line operated as normally open at Edwards<sup>3</sup>;
- New 500 kV Tucker Substation<sup>4</sup>;
- Loop Lugo-Vincent No.1 & No.2 transmission lines through Tucker Substation; and

---

<sup>1</sup> <http://www.caiso.com/planning/Pages/TransmissionPlanning/2012-2013TransmissionPlanningProcess.aspx>

<sup>2</sup> Required upgrades at SCE's Kramer Substation to accommodate new double-circuit 500 kV line are not described in the CAISO's 2012-2013 Annual Transmission Plan.

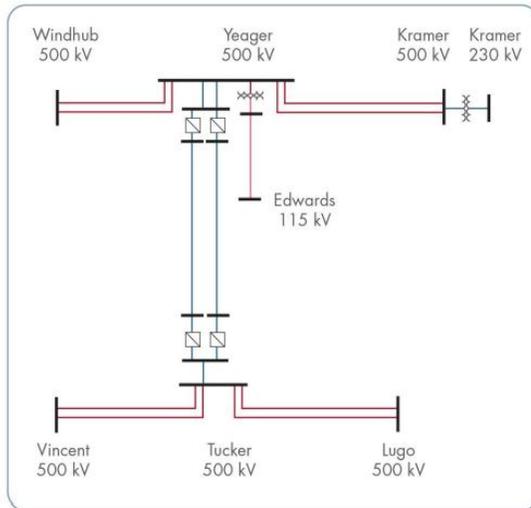

<sup>3</sup> Required upgrades at Edwards to accommodate new 115 kV line are not described in the CAISO's 2012-2013 Annual Transmission Plan.

<sup>4</sup> Required telecommunications to new Tucker Substation necessary to provide proper line protection once existing Lugo – Vincent 500 kV transmission lines are looped in are not described in the CAISO's 2012-2013 Annual Transmission Plan.

- New 2000 MW capacity underground DC line between Yeager and Tucker Substation.

Figure 1.0-B below shows the Expanded Case configuration:

**Figure 1.0-B AV Clearview Expanded Case<sup>1</sup>**

CAISO's analysis in their 2012-2013 Transmission Plan indicated that the AV Clearview Expanded Case Proposal did not produce economic benefits that would offset the higher costs of the project relative to Coolwater-Lugo.

**Project Objectives, Feasibility, and Environmental Considerations:** The AV Clearview Proposal's Expanded Case would not be able to integrate new generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas (Objective 2 - Provide transmission that would facilitate the full delivery of future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley/future Jasper Substation, Town of Apple Valley, and Owens Valley areas) because it also could not be implemented in a cost effective and timely manner. Furthermore, potential environmental impacts for the Expanded Case are not known; however, it should be noted that new ROW, new substations, and substation expansions would be required on currently undisturbed lands.

This proposal would not meet applicable CAISO, NERC and WECC planning criteria (Objective 3 – Comply with all applicable reliability planning criteria) as demonstrated by the CAISO's analysis of the AV Clearview Proposal in their 2012-2013 Annual Transmission Plan. The analysis indicated that the proposed connection from Yeager to SCE's Edwards Substation would result in overloads on the proposed Yeager-Edwards 115 kV line, the existing Edwards-Holgate 115 kV line, and the existing Kramer-Holgate 115 kV line. The CAISO's proposed mitigation for these overloads was to leave the Yeager-Edwards 115 kV line open; however, this operating condition would result in this

<sup>1</sup> <http://www.caiso.com/Documents/BoardApproved2012-2013TransmissionPlan.pdf>

line having the sole purpose of providing energy redundancy for Edwards AFB<sup>1</sup>. SCE's review of outage history has revealed that the existing 115 kV line serving Edwards AFB has not experienced a prolonged outage in the last ten years. All outages have been categorized as "open and reclose" operations and have thus been minimal in duration. Any proposed "energy redundancy" aspects would therefore not exist since the proposed line would be operated normally open and would close only upon loss of the existing 115 kV line. As such, the exact same outage duration would be experienced with or without AV Clearview's proposed Yeager-Edwards 115 kV line. Consequently, the Yeager-Edwards 115 kV line provides no real measurable benefit and has not been identified to be required in any of the load serving studies that have been performed as part of the CAISO's Annual Transmission Plan. Furthermore, since the existing SCE Edwards Substation does not have a 115 kV switchrack, the proposed Yeager-Edwards 115 kV line would require a complete rebuild of Edwards Substation and the construction of an Edwards 115 kV Switchrack, which would also not meet Objective 12 (Objective 12 – meet project needs in a cost-effective and timely manner).

Furthermore, System Alternative 8 would not facilitate the interconnection of CREST and Rule 21 projects (Objective 6 – Facilitate CREST, Re-MAT, and Rule 21 projects), address transmission capacity concerns from the City of Ridgecrest (Objective 8 – Address transmission capacity concerns from the City of Ridgecrest), or meet the project needs in a timely manner (Object 12 – Meet project needs in a timely manner). Objectives 6, 8, and 12 would not be achieved because System Alternative 8 would significantly delay the operating date due to the additional environmental work, agency approvals, engineering that would be needed for construction of the AV Clearview Proposal's Expanded Case, which includes but is not limited to the required substation rebuild of SCE's Edwards Substation, the expansion of SCE's existing Kramer 220/115 kV Substation to include 500 kV facilities, and new telecommunication facilities to support line protection and possibly an SPS.

Expansion of the existing Kramer Substation with 500 kV facilities would require approximately 92 additional acres adjacent to the existing Kramer Substation to accommodate the full build-out of a standard SCE designed 500/220 kV substation. Facilities to support a new double-circuit Yeager-Kramer 500 kV transmission line would require a 500 kV operating bus, one or more 500/220 kV transformer banks, a MEER, and the installation of additional ancillary equipment including but not limited to circuit breakers, disconnects, conductor, and system protection. In addition, this substation expansion would require the relocation of approximately two miles of the existing Kramer-Rocket Test 115 kV subtransmission line on expanded or new ROW.

This delay would negatively affect multiple large and small renewable generation requests currently in the CAISO and SCE generation interconnection queues, in addition to the ~~250~~275 MW Barstow area renewable generation project, currently under construction, that are all seeking interconnection into SCE's North of Kramer electrical area. By delaying the necessary transmission required for these project interconnections,

---

<sup>1</sup> <http://www.caiso.com/Documents/CriticalPathCommentsDraft2012-2013TransmissionPlan.pdf>

System Alternative 8 would negatively affect the ability of these queued projects to negotiate PPAs due to delayed commercial operating dates and would also negatively impact the resource adequacy status and PPA obligations of the ~~250~~275 MW Barstow area renewable generation project. SCE is obligated to make a best effort with meeting the operating dates in generation interconnection agreements so that generation developer resource adequacy status or obligations under PPAs are not jeopardized. In addition, this extended delay for transmission capacity in the North of Kramer electrical area could lead to complaints filed with the CPUC against SCE for unfairly prohibiting renewable generation interconnection under the Feed-in Tariff program, and/or the CSI, or the NHSP.

Moreover, because transmission facilities for Alternative 8 would be located on the west side of Highway 395, this alternative would not include a new Desert View Substation southeast of the Town of Apple Valley (Objective 9 - License a new multipurpose substation to facilitate load serving, reliability, and future generation interconnections ~~provide reliability, and support load growth and generation interconnections in the Apple Valley area~~). Alternative 8 would also not minimize environmental impacts or utilize the route that would minimize environmental impacts (Objective 11 – Minimize environmental impacts and utilize the shortest route that minimizes environmental impacts). AV Clearview’s Expanded Case would require approximately 84 miles of new transmission facilities on new or expanded ROW, approximately 40 miles of which would be underground<sup>1</sup>. Underground transmission facilities usually involve a combination of trenching and tunneling and the installation of cooling equipment, splice vaults, and underground ducts. Undergrounding would result in more severe impacts to air quality from emission from construction equipment, could disturb cultural resources and potentially hazardous waste (e.g., mining waste) buried at shallow depths, and could also create noise and vibration, potentially affecting nearby structures, protected species, surface and groundwater resources and deeply buried geological and paleontological features. Furthermore, an additional 92 acres would be required to expand SCE’s existing Kramer Substation to include 500 kV facilities, a two mile subtransmission line would require relocation, SCE’s Edwards 115 kV Substation would need to be rebuilt to include a 115 kV switchrack, and Fiber-Optic telecommunication facilities. Because Alternative 8 would be located in a different area than the proposed Coolwater-Lugo, it may require substantially greater new telecommunication facilities to support line protection and possibly an SPS than Coolwater-Lugo. Alternative 8 could require approximately 128 miles of new Fiber-Optic cable between Lugo Substation and Vincent Substation requiring approximately 323 new poles<sup>2</sup>. The installation of these Fiber-Optic structures would require an undetermined amount of new roads, grading, and laydown areas. In addition, new microwave antennas may need to be installed at the proposed Tucker Substation and the existing Frost Peak communication site in Wrightwood, California.

---

<sup>1</sup> See Footnote 25.

<sup>2</sup> As compared to the Kramer-Llano 500 kV upgrade as estimated in the CAISO Transition Cluster Phase II Interconnection Study Report for SCE’s East of Lugo Bulk System

Alternative 8 would also not meet the cost goals of Objective 12 (Objective 12 - Meet project needs in a cost-effective manner). SCE has identified additional significant costs that would be necessary for the AV Clearview's Expanded Case Proposal, which were not identified in the CAISO's 2012-2013 Transmission Plan<sup>1</sup>. These costs include the expansion of SCE's existing Kramer Substation to include 500 kV facilities, the rebuild of SCE's existing Edwards Substation to include a 115 kV Switchrack, and the 128 miles of telecommunications, all of which would not be required as part of Coolwater-Lugo, and which would result in higher costs passed on to SCE ratepayers. Finally, the AV Clearview Proposal's Expanded Case was determined not to be needed by the CAISO and was therefore not modeled in their 2012-2013 Transmission Plan.

In addition, future expansion of Kramer Substation with 500 kV facilities may not be possible due to Caltrans' proposed SR-58 Kramer Junction Expressway Project.<sup>2</sup> This proposed Caltrans Project would widen and realign a 13.3-mile segment of SR-58 centered on Kramer Junction, where SR-58 intersects with US-395, in San Bernardino County. The four possible build alternatives are located on the Caltrans SR-58 Kramer Junction Expressway Project website<sup>3</sup>. All of these four alternatives would negatively impact the expansion of Kramer Substation to 500 kV and/or possible line routing to Kramer Substation. These complications would delay Coolwater-Lugo's operating date, increase its cost, and possibly negatively impact access to Kramer Substation.

Since System Alternative 8 fails to achieve most of the basic Coolwater-Lugo objectives, this alternative was eliminated from further consideration. Additional SCE comments on the AV Clearview Proposal are located on the CAISO's 2012-2013 Transmission planning process webpage<sup>4</sup>.

### 1.4.9 System Alternative 9 - No Project Alternative

Description: Under the No Project Alternative, there would be no facility upgrades or other changes to the electric transmission system. Proposed alternatives, including new and upgraded transmission lines and substations, would not be constructed.

Project Objectives, Feasibility, and Environmental Considerations: With implementation of the No Project Alternative, the following key objectives would not be met:

---

<sup>1</sup> SCE believes the costs of the AV Clearview's Baseline and Expanded Case Proposals are underestimated because both these proposal require SCE upgrades to existing facilities and SCE was never contacted for the necessary cost and scope estimates.

<sup>2</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/index.htm](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/index.htm)

<sup>3</sup> [http://dot.ca.gov/dist8/projects/san\\_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf](http://dot.ca.gov/dist8/projects/san_bernardino/sr58/kramerjunction/pdf/Alternative%20Project%20Routes.pdf)

<sup>4</sup> <http://www.aiso.com/planning/Pages/TransmissionPlanning/2012-2013TransmissionPlanningProcess.aspx>

1. Facilitate SCE and other California utilities achievement of California's RPS in an expedited manner;
2. Provide transmission facilities identified as necessary for the full delivery of 1) a 250275 MW renewable generation project located in the Barstow area; 2) future generation resources in the Barstow, Inyokern, Kramer, Lucerne Valley, Town of Apple Valley, and Owens Valley areas;
3. Support California's GHG Reduction Program;
4. Support BLM compliance with the Federal Renewable Energy Mandate;
5. Provide transmission facilities in a timely manner that would facilitate the interconnection of CREST and Rule 21 projects;
6. Provide transmission facilities that facilitate the Department of Defense meeting their Energy Mandate of producing or procuring 25% of their total energy from renewable energy sources beginning in 2025 as outlined under the National Defense Authorization Act of 2010;<sup>1</sup>
7. Address transmission capacity concerns from the City of Ridgecrest;
8. License a new multipurpose 500/220/115/12 kV Desert View Substation southeast of the Town of Apple Valley to facilitate load serving, reliability, and future generation interconnections; and,
9. Meet project needs in a cost-effective and timely manner.

The No Project Alternative would not meet the project objectives, but is retained in the PEA to enable the CPUC to compare the impacts of approving the proposed Coolwater-Lugo with the impacts of not approving the project.

## 1.5 System Alternatives Comparison

SCE evaluated each system alternative for its ability to meet the project objectives. Each of these alternatives differs according to environmental impacts, engineering feasibility, and cost. SCE concluded that Coolwater-Lugo (the system alternative presented in Section 1.0) is the only feasible alternative that could be implemented in an efficient and expedited manner that would meet all 13 project objectives presented in Section 1.3. However, as discussed in Section 1.4, Electric System Alternatives, the analysis determined that the following system alternatives are feasible, but do not meet all 13 of the basic project objectives:

- System Alternative 1 – Coolwater-Pisgah 220 kV Transmission Line

---

<sup>1</sup> See [http://www.govenergy.com/2010/Files/Presentations/Renewables/2010\\_GovEnergy\\_Tindal.pdf](http://www.govenergy.com/2010/Files/Presentations/Renewables/2010_GovEnergy_Tindal.pdf)

- System Alternative 4 – Kramer-Lugo No.3 220 kV Transmission Line
- System Alternative 5 – Kramer-Llano 500 kV Transmission Line
- System Alternative 6 – Kramer-Llano 500 kV Transmission Line and Rebuild of Lugo-Pisgah No.1 220 kV Transmission Line
- System Alternative 7 – AV Clearview Transmission Proposal – Baseline Case
- System Alternative 8 – AV Clearview Transmission Proposal – Expanded Case
- System Alternative 9 – No Project Alternative

### **1.5.1 System Alternatives Considered and Eliminated**

As described in section 1.4, the following system alternatives were considered and eliminated because they failed to meet most of the basic project objectives:

- System Alternative 1 – Coolwater-Pisgah 220 kV Transmission Line
- System Alternative 2 – Rebuilding the Kramer-Lugo 220 kV Transmission Lines
- System Alternative 3 – Reconductoring the Kramer-Lugo 220 kV Transmission Lines
- System Alternative 4 – Kramer-Lugo No.3 220 kV Transmission Line
- System Alternative 5 – Kramer-Llano 500 kV Transmission Line
- System Alternative 6 – Kramer-Llano 500 kV Transmission Line and Rebuild of Lugo-Pisgah No.1 220 kV Transmission Line
- System Alternative 7 – AV Clearview Transmission Proposal – Baseline Case
- System Alternative 8 – AV Clearview Transmission Proposal – Expanded Case
- System Alternative 9 – No Project Alternative

## **1.6 Project Summary**

To provide additional south of Kramer capacity to integrate current and future renewable generation projects, SCE needs to develop new and upgraded transmission facilities. These new and upgraded transmission facilities would eliminate the bottlenecks that would preclude renewable generation resources from reaching the utility load centers. To this end, SCE is required to develop and maintain a reliable transmission network with adequate capacity. The facilities needed to deliver the electrical power from the new planned generation resources located in the Barstow, Inyokern, Kramer, Lucerne Valley, and Owens Valley areas have been identified through generation interconnection studies

performed as mandated by the CAISO. The major components of these facilities are summarized below with complete descriptions provided in Chapter 3, *Project Description*.

### 1.6.1 Substations

- Reconfigure Coolwater 220 kV Switchyard
- Terminate new Coolwater-Desert View 220 kV Transmission Line at the Coolwater and Desert View 220 kV buses
- Install new relay buildings and necessary equipment to support the SPS at Coolwater 220 kV Switchyard
- ~~▪ Expand the Lugo 500 kV Switchrack to the south five positions~~
- ~~▪ Relocate two existing 500 kV transmission line terminations at Lugo Substation~~
- Terminate new Desert View-Lugo 220 kV Transmission Line at the Desert View and Lugo 220 kV buses
- ~~▪ Install one 500/220 kV transformer bank at Lugo Substation~~
- ~~▪ Construct new relay building and install bank protection relays at Lugo Substation~~
- Install new protection, control, and SPS at Lugo Substation
- License proposed Desert View 500/220/115/12 kV Substation and initially construct the facilities necessary to loop Coolwater-Lugo 220 kV Transmission Line and the Lugo-Pisgah No.1 & No.2 220 kV Transmission Lines into Desert View Substation including new protection, control, and SPS at Desert View Substation.

### 1.6.2 Transmission and Telecommunication

- Remove approximately 29.1 miles of the existing Lugo-Pisgah No.1 220 kV Transmission Line from Lugo Substation northeast to approximately the intersection of Haynes Road and SR-247
- Remove approximately 16.0 miles of the existing Lugo-Pisgah No.2 220 kV Transmission Line from Lugo Substation northeast to proposed Desert View Substation and terminate the remaining portion of this line into the proposed Desert View Substation
- Construct 16.6 miles of 500 kV single-circuit transmission line utilizing 2B-2156 ASCR conductor (initially operated at 220 kV) from Lugo Substation to the proposed Desert View Substation and 13.6 miles of 220 kV double-circuit

transmission line in existing ROW from proposed Desert View Substation to approximately the intersection of Haynes Road and SR-247

- Construct approximately 34.0 miles of 220 kV double-circuit transmission line from Coolwater 220 kV Switchyard south to the existing Lugo-Pisgah transmission corridor, located approximately near the intersection of Haynes Road and SR-247
- Install a new 150-foot tall microwave tower and foundation at the existing Coolwater 220 kV Switchyard
- Install lightwave transponder equipment or optical amplifier and channel bank equipment at Coolwater Switchyard, Lugo Substation, and the proposed Desert View Substation
- Install approximately 11.0 miles of Fiber-Optic Cable from existing Apple Valley Substation to the proposed Desert View Substation
- Install approximately 29.0 miles of Fiber-Optic Cable from existing Pisgah Substation near Ludlow to the existing Gale Substation near Daggett

<sup>1</sup> The nameplate capacity values were obtained from a variety of sources including but not limited to generation interconnection agreements, power purchase agreements, distribution service agreements, generation interconnection applications, the Qualifying Facilities Semi-Annual Status Report to the CPUC, and the CAISO’s Generating Capability List.

<sup>2</sup> Net MW to Grid are the actual MW values that get injected into the electric grid due to factors including but limited to on-site auxiliary loads, contractual limitations, and facility constraints. The Net MW to Grid values are obtained from <http://www.caiso.com/Documents/AppendixADraft2013-2014TransmissionPlan.pdf> (pp. A-15-A-16). The MW values to from the Draft 2013-2014 plan are used since the Board Approved 2013-2014 Plan’s North of Lugo generation values have numerous typos that have not been corrected.

<sup>3</sup> Online date ranges indicate the generation facility has multiple generators which came on-line during different years. The earliest and latest dates for the range are provided.

<sup>4</sup> Expected retirement date ranges indicate the generation facility has multiple generators which will retire during different years. The earliest and latest dates for the range are provided. The term “undefined” indicates there is no contractual obligation for the generation facility to retire. It should also be noted that any generator could choose to extend its retirement date by amending or entering into a new contract.

3	909 <sup>6</sup>	Solar Thermal	366.0	25.0	07/07/2014 / 07/07/2044	Complete Phase 2 Cluster Study	100%	Permits Complete	Yes / Yes	Barstow	West Mojave & Eastern Slopes
				<b>Total =</b>	<b>458.0<sup>7</sup></b>	<b>355.0</b>					

<sup>5</sup> The online date is the generation project's requested date as noted in the CAISO or SCE generation queues. The Retirement date is 20 years added to the online date. Many projects with online dates before the operational date of Coolwater-Lugo will need to wait for the Coolwater-Lugo to be in-service before they can generate as indicated in Table 1.0-N.

<sup>6</sup> Q909 is a 25 MW increase to Q125.

<sup>7</sup> Since Q125 and Q909 represent the same generation units, the nameplate capacity of 366.0 MW is only counted once.

**Table 1.0-C Generation in SCE Queue Requesting Interconnection in Kramer System**

#	SCE Queue #	Fuel Type	MW Nameplate Capacity	Net MW to Grid <sup>8</sup>	Online Date <sup>9</sup> / Retirement Date	Electrical Studies	Deliverability Allocation	Permitting Status	GIA/ PPA	RETI CREZ	DRECP DFA

6	5879	Photovoltaic	0.3	0.0	09/30/2013 / 09/30/2033	Completed Rule 21 Interconnection Study	0%	Permitting Complete	Yes / N/A	Barstow	West Mojave & Eastern Slopes

<sup>8</sup> Net MW to Grid with “0” values indicate the projects will not export and will serve their own site load. However, projects installing generation to serve their own load effectively reduce the overall Kramer area load, which increases MW flows on the Kramer-Lugo Transmission Corridor and aggravates the existing transmission capacity bottleneck between Kramer and Lugo Substations.

<sup>9</sup> The online date is the generation project’s requested date as noted in the CAISO or SCE generation queues. The Retirement date is 20 years added to the online date. Many projects with online dates before the operational date of Coolwater-Lugo will need to wait for the Coolwater-Lugo to be in-service before they can generate as indicated in Table 1.0-N.

#	Study or Filing	Date	Performed by <sup>11</sup>	Study Results & Relation to Coolwater-Lugo
1	Harper Lake Solar Plant Generator Interconnection Feasibility Study	4/2/07	CAISO & SCE	The Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q125 Mojave Solar Project.
2	Harper Lake Solar Plant Project Interconnection System Impact Study	6/27/08	CAISO & SCE	The Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q125 Mojave Solar Project.
3	KM Acquisitions Interconnection System Impact Study	7/29/08	CAISO & SCE	The Q142 KM Acquisitions Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line is the evolution of the previously prescribed upgrades to provide another power path from Kramer to Lugo in order to mitigate the identified overloads and safely and reliability interconnect the Q142 KM Acquisitions Project.
4	Harper Lake Solar Plant Project Technical Assessment	12/12/08	SCE	This study took into account various queued ahead generation project withdrawals and determined the Q125 Mojave Solar Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line was specifically identified to provide another power path from Kramer to Lugo to mitigate the identified overloads in order to safely & reliability interconnect the Q125 Mojave Solar Project.
5	KM Acquisitions Technical Assessment	12/18/08	SCE	This study took into account various queued ahead generation project withdrawals and determined the Q142 KM Acquisitions Project's incremental MW output causes base case and contingency overloads on the Kramer-Lugo 220 kV lines in the Kramer-Lugo Transmission Corridor. The Coolwater-Lugo 220 kV line was specifically identified to provide another power path from Kramer to Lugo to mitigate the identified overloads in order to safely & reliability interconnect the Q142 KM Acquisitions Project.
6	CAISO LGIP Transition Cluster Phase 1 Interconnection Study SCE's East of Lugo Bulk System Group Network Analysis	7/28/09	CAISO & SCE	The incremental output of the Transition Cluster Phase 1 East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
7	LGIP Cluster 1 Phase 1 Interconnection Study Report SCE's East of Lugo Bulk System	5/28/10	CAISO & SCE	The incremental output of the Cluster 1 Phase 1 East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
8	Transition Cluster Phase II Interconnection Study Report SCE's East of Lugo Bulk System	8/12/10	CAISO & SCE	This study took into account various queued generation withdrawals and modifications from Transition Cluster Phase 1 to Transition Cluster Phase 2 and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
9	QC 2 Phase 1 Interconnection Report SCE's East of Lugo Bulk System	11/12/10	CAISO & SCE	The incremental output of the QC 2 Phase 1 Interconnection East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.

<sup>11</sup> Generation interconnection studies are not public proceedings or final decisions. The CAISO Annual Transmission Plans are public proceedings, but final decisions.

#	Study or Filing	Date	Performed by <sup>11</sup>	Study Results & Relation to Coolwater-Lugo
10	FERC Incentive Filing	3/11/11	FERC	Final decision granting SCE recovery of 100 percent construction work in progress (CWIP) and recovery of 100 percent of prudently-incurred abandoned plant costs for most project components of Coolwater-Lugo.
11	CAISO 2010-2011 Transmission Plan	5/18/11	CAISO & SCE	The Coolwater-Lugo 220 kV line is identified as an element supporting renewable energy goals, as being needed for deliverability in three of the four studied planning scenarios, as having 600 MW Renewable Deliverability Potential, as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.
12	QC 3 Phase 1 Interconnection Study Report SCE's East of Lugo Bulk System	5/27/11	CAISO & SCE	The incremental output of the QC 3 Phase 1 Interconnection East of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
13	Queue Cluster 1 & 2 Phase II Interconnection Study Report SCE's East of Lugo Bulk System	8/26/11	CAISO & SCE	This study took into account various queued generation withdrawals and modifications from Queue Cluster 1 & 2 Phase I to Queue Cluster 1 & 2 Phase II and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
14	Queue Cluster 4 Phase I Interconnection System Report SCE's North of Lugo Bulk System	12/31/11	CAISO & SCE	The incremental output of the Queue Cluster 4 Phase I Interconnection North of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
15	Cluster 1 & 2 Deliverability Re-Assessment	1/31/12	CAISO	This study was performed by the CAISO pursuant to the 10/31/12 Technical Bulletin on Cluster 1-4 Deliverability Procedures and for the sole purpose of applying those procedures to Cluster 1 & Cluster 2. This analysis concluded the Coolwater-Lugo 220 kV T/L was still required in order to provide additional transmission capacity.
16	CAISO 2011-2012 Transmission Plan	3/23/12	CAISO & SCE	The Coolwater-Lugo 220 kV line is identified as modeled in the policy-driven planning base cases, as serving the Kramer, Inyokern, Owens Valley, and San Bernardino-Lucerne CREZs, and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.
17	QC3 and QC4 Phase II Interconnection Study Report SCE's North of Lugo Bulk System	11/9/12	CAISO & SCE	This study took into account various queued generation withdrawals and modifications from Queue Cluster 3 & 4 Phase I to Queue Cluster 3 & 4 Phase II and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
18	Queue Cluster 5 Phase I Interconnection Study Report SCE's North of Lugo System	1/31/13	CAISO & SCE	The incremental output of the Queue Cluster 5 Phase I Interconnection North of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
19	CAISO 2012-2013 Transmission Plan	3/20/13	CAISO & SCE	The Coolwater-Lugo 220 kV line is identified as ensuring the deliverability of 750 MW of renewable generation in the Kramer zone and 106 MW in the Lucerne zone, in the Commercial Interest portfolio. The Coolwater-Lugo 220 kV line was also identified to address the diverged power flow solution on the Kramer 230 kV-Lugo 230 kV #1 and #2 lines contingency, as needed additional network transmission to support renewable energy goals, as providing 700-1,100 MW of deliverability, and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.
20	QC5 Phase II Interconnection Report SCE North of Lugo Area	12/3/13	CAISO & SCE	This study took into account various queued generation withdrawals and modifications from Queue Cluster 5 Phase I to Queue Cluster 5 Phase II and required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.

#	Study or Filing	Date	Performed by <sup>11</sup>	Study Results & Relation to Coolwater-Lugo
21	Queue Cluster 6 Phase I Interconnection Study Report SCE North of Lugo Area	1/17/14	CAISO & SCE	The incremental output of the Queue Cluster 5 Phase 1 Interconnection North of Lugo generation projects required the Coolwater-Lugo 220 kV line in order to provide additional transmission capacity in the Kramer System.
22	CAISO 2013-2014 Transmission Plan	3/12/14	CAISO & SCE	The Coolwater-Lugo 220 kV line is identified as needed additional network transmission to support renewable energy goals and as a project that defers the need for the CAISO to approve additional transmission projects in order to meet California's 33% RPS goals.

**Table 1.0-N Queued Kramer & Jasper Generation & Coolwater-Lugo Need**

#	CAISO or SCE Queue #	Net MW to Grid	Point of Interconnection	Coolwater-Lugo Need
1	125	250.0	Sandlot Substation	Q125's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor, consume that corridor's remaining capacity, and create Base Case and contingency overloads. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
2	142	80.0	Kramer Substation	Q142's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
3	909	25.0	Sandlot Substation	Q909's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
4	WDT315	40.7	Control Substation	WDT315's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
5	5707	0.0	Edwards Substation	5707 is a 1.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 1.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 1.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.
6	5708	0.0	Edwards Substation	5708 is a 0.99 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 0.99 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 0.99 MW, and which will aggravate the Kramer-Lugo transmission constraint.

#	CAISO or SCE Queue #	Net MW to Grid	Point of Interconnection	Coolwater-Lugo Need
7	5709	0.0	Edwards Substation	5709 is a 1.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 1.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 1.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.
8	5729	0.0	Rickover 33 kV line	5729 is a 11.1 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 11.1 MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 11.1 MW, and which will aggravate the Kramer-Lugo transmission constraint.
9	5879	0.0	Montara 33 kV line	5879 is a 0.3 MW non-export project which will serve its own electrical load, thus causing the overall Kramer System load to be reduced by 0.3MW, and which increases the amount of excessive MW accumulating at Kramer Substation by 0.3 MW, and which will aggravate the Kramer-Lugo transmission constraint.
10	WDT930	20.0	Baroid 33 kV line	Q930's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
11	WDT931	20.0	Remote 33 kV line	Q931's MW output will flow to the capacity constrained Kramer-Lugo transmission corridor and aggravate the constraint. Coolwater-Lugo is needed to create a new transmission path from Kramer to Lugo, which will allow a significant amount of power accumulating at the Kramer, Sandlot, and Coolwater 220 kV Substations to bypass the Kramer-Lugo transmission corridor, thus alleviating the capacity constraint.
12	552	60.0	Jasper Substation	The combined MW output of Q552 & Q897 will exceed the transmission capacity on the existing Lugo-Pisgah No.1 220 kV line. Coolwater-Lugo will rebuild the portion this line from the Jasper Substation area, west to Lugo Substation and would provide additional capacity to accommodate Q552 & Q897.
13	897	200.0	Jasper Substation	The combined MW output of Q552 & Q897 will exceed the transmission capacity on the existing Lugo-Pisgah No.1 220 kV line. Coolwater-Lugo will rebuild the portion this line from the Jasper Substation area, west to Lugo Substation and would provide additional capacity to accommodate Q552 & Q897.

**Total = 695.7**

**Table 1.0-O Purpose & Need Justification for the Coolwater-Lugo Elements**

Element <sup>12</sup>	Purpose and Need	Mojave Solar LGIA	FERC Incentive Filing	Future CAISO Study, Review, or Approval?	Estimated Need Date
<b>Substations</b>					
Coolwater	<ul style="list-style-type: none"> <li>Minimum Build: 220 kV switchyard reconfiguration and supporting equipment required to terminate new transmission line</li> <li>Initial Build: Same as Minimum Build</li> <li>Full Build: Same as Minimum Build</li> </ul>	Minimum Build	Minimum Build	Not required	2018
Desert View	<ul style="list-style-type: none"> <li>Minimum Build: Four-position 220 kV switchrack including all supporting infrastructure located on 86 acres but grading only 13.5 acres and installing a chain link fence around the 13.5 acres. Required to connect four 220 kV transmission lines, facilitate future generation interconnections, future load serving, and future reliability.</li> <li>Initial Build: Same as Minimum Build except for grading the entire 86 acres and installing perimeter wall around the 86 acres instead of a chain link fence around the 13.5 acres.</li> <li>Full Build: Install 500 kV, additional 220 kV, 115 kV, and 12 kV substation facilities. Required at a future point to serve future generation interconnections, load, and reliability.</li> </ul>	Minimum Build  Not included in LGIA since LGIA assumed Jasper was moving forward	Minimum Build  Not included in FERC filing since FERC filing contemplated Jasper moving forward	Minimum & Initial Build – It is SCE’s belief that further CAISO Study, Review, Approval is Not Required.  Full Build – The CAISO would study, review and approve the 500 kV & 220 kV Desert View elements expanded beyond the initial 4-position 220 kV switchrack.	Minimum Build – 2018  Initial Build – 2018  Portions of Full Build – 2025 to 2029
Lugo	<ul style="list-style-type: none"> <li>Minimum Build: 220 kV switchyard supporting equipment required to terminate new transmission line.</li> <li>Initial Build: Same as Minimum Build</li> <li>Full Build: Same as Minimum Build</li> </ul>	Minimum Build	Minimum Build	Not Required	2018

<sup>12</sup> The Lugo No. 3AA 500/220kV transformer bank was removed from this table since it is no longer included as a Coolwater-Lugo element.

<b>Coolwater- Lugo Transmission Line</b>					
Coolwater to Lugo-Pisgah corridor (Seg. 12,1,2,3)	<ul style="list-style-type: none"> <li>Minimum Build: Double-circuit single side strung capacity necessary for Full Delivery of the Mojave Solar Project.</li> <li>Initial Build: Double-circuit both sides strung. Required to provide the additional transmission capacity necessary for Full Delivery of the Mojave Solar Project. Stringing both sides is needed to eliminate future environmental impacts associated with stringing second circuit at a later date and minimize overall cost of stringing both sides by maximizing use of resources during initial construction.</li> <li>Full Build: Same as Initial Build</li> </ul>	Minimum Build	Initial Build	It is SCE's belief that further CAISO Study, Review, Approval is Not Required.	2018
Lugo-Pisgah Corridor to Desert View (Seg. 5 and 5A)	<ul style="list-style-type: none"> <li>Minimum Build: Double-circuit both sides strung located on existing ROW by removing portion of the existing Lugo-Pisgah No.1 220 kV T/L. Required to provide the additional transmission capacity necessary for Full Delivery of the Mojave Solar Project and to reestablish the portion of existing Lugo-Pisgah No.1 220 kV T/L removed to use existing ROW.</li> <li>Initial Build: Same as Minimum Build</li> <li>Full Build: Same as Minimum Build</li> </ul>	Minimum Build with one side strung since FERC filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project.	Minimum Build with one side strung since FERC filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project.	It is SCE's belief that further CAISO Study, Review, Approval is Not Required.	2018
Desert View to Lugo (Seg. 7)	<ul style="list-style-type: none"> <li>Minimum Build: Single-circuit 500 kV transmission line (2B-2156 ACSR), initially energized at 220 kV, replacing the two existing Lugo-Pisgah No.1 and No.2 220 kV T/Ls. Required to provide the additional transmission capacity necessary for Full Delivery of the Mojave Solar Project.</li> <li>Initial Build: Same as Initial Build</li> <li>Full Build: Same as Initial Build</li> </ul>	Minimum Build	Minimum Build	It is SCE's belief that further CAISO Study, Review, Approval is Not Required.	2018
<b>Telecommunications</b>					

Fiber Optics, Microwave, and other supporting equipment	Telecommunications needed to support Coolwater-Desert View, Desert View-Lugo, and Desert View-Pisgah line protection and Special Protection System	Minimum Build	Portion <sup>13</sup> of Minimum Build since FERC filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project.	Not required	2018
---	--	---------------	--	--------------	------

---

<sup>13</sup> Since the FERC Filing contemplated Jasper Substation and new Lugo-Pisgah 500 kV T/L with Pisgah 500 kV Substation in-service as part of separate project, it did not include the Apple Valley-Desert View fiber optic.

**Appendix M**

**JOINT STATEMENT OF PURPOSE AND NEED**

**Joint Statement of Southern California Edison Company,  
California Independent System Operator and Mojave Solar LLC**

SCE, CAISO, and Mojave Solar LLC, have conferred in an effort to create a Joint Statement as requested by the CPUC Administrative Law Judge in Application No. 13-08-023 regarding the need and purpose for individual CLTP project components required for interconnection of the Mojave Solar Project with full deliverability.

In this Joint Statement:

- SCE, CAISO and Mojave Solar LLC all concur that a new 220 kV circuit extending from Coolwater to Lugo is necessary to meet the deliverability requirements set out in the LGIA for the Mojave Solar Project. The SCE applied-for project meets those requirements.
- SCE, CAISO and Mojave Solar LLC all concur that it is reasonable to remove the Lugo No.3AA 500/220 kV transformer bank from the CLTP project at this time.

SCE has set out a Minimum Build Out Option consisting of the project components set forth in the table<sup>1</sup> below that meet the requirements of the Mojave Solar LLC LGIA for full deliverability. This option is a subset of the project components identified in Application No. 13-08-023 or modification to those components, and addresses further considerations that SCE believes must be met.

CLTP Project Components		
Substation	Description	Notes
Coolwater	220 kV Switchyard reconfiguration and supporting equipment	Required to terminate new transmission line at Coolwater.
Desert View	Initial 4 Position Switchrack including all supporting infrastructure	Grade 13.5 acres, chain link fence
Lugo	220 kV Switchyard supporting equipment	Required to terminate new transmission line at Lugo.
Transmission	Description	Notes
Segment 1	220 kV Double Circuit One side strung	
Segment 2	220 kV Double Circuit One side strung	
Segment 3	220 kV Double Circuit One side strung	
Segment 5	220 kV Double Circuit	Double-circuit within existing ROW by replacing a

<sup>1</sup> A more detailed description of these components is provided in the Proponent's Environmental Assessment

	To stay within ROW	portion of existing Lugo – Pisgah No.1 220 kV to keep two 220 kV T/Ls to Pisgah Sub and support new line to Coolwater (Coolwater line on north side of structure, Lugo-Pisgah No.1 on south side of structure)
Segment 5A	220 kV Double Circuit (Ingress into Desert View)	Double-circuit on new ROW to connect the existing Lugo – Pisgah No. 1 220 kV and new Coolwater 220 kV transmission line into the Desert View Substation.
Segment 7	Single Circuit (2B-2156 Conductor)	Single-circuit 2B-2156 high capacity conductor to connect Desert View to Lugo Substation utilizing existing ROW by replacing both Lugo – Pisgah No.1 and No. 2 220 kV T/Ls
Segment 12	220 kV Double Circuit One side strung	
Telecommunication	Description	Notes
Fiber Optics, Microwave, and other	<ul style="list-style-type: none"> <li>Approximately 11-miles from existing Apple Valley 115/33 kV Substation to new Desert View Substation</li> <li>Approximately 29-miles from existing Gale 115/33 kV Substation to existing Pisgah Substation</li> <li>New microwave tower at existing Coolwater 220 kV Switchyard</li> <li>Other telecomm equipment (e.g. transponder, lightwave, optical amplifier) at Lugo, Desert View, Coolwater and Pisgah</li> </ul>	Telecomm needed to support Desert View-Lugo and Desert View-Pisgah line protection and Special Protection System.

SCE, CAISO and Mojave Solar LLC agree that the above project components provide full deliverability to Mojave Solar LLC consistent with the LGIA.

The CAISO has also identified an alternative configuration consisting of a 220kV single-circuit design directly connecting the Coolwater substation to the Lugo substation. This alternative would construct different tower structures, would not include a Desert View switchrack, and would require the elimination of one of the two existing Lugo-Pisgah 220 kV lines for purposes of making right-of-way available between the Jasper area and Lugo. Electrically, this CAISO alternative would also allow for the full deliverability of Mojave Solar LLC. The CAISO is not in a position to comment on the viability of this alternative to address Mojave Solar LLC's timing needs. SCE and Mojave Solar LLC are not in a position to comment on the impacts of the CAISO alternative configuration at this time.

SCE, CAISO and Mojave Solar LLC agree that SCE has identified reasons for constructing the SCE Minimum Build Out Option that the CPUC should consider in this proceeding.
