EXECUTIVE SUMMARY

The purpose of this Preliminary Hydrology Report is to investigate the hydrologic impacts of developing approximately 513 acres in eastern San Diego County. Results from hydrologic analysis will be included in the Tule Wind Environmental Impact Statement (EIS)/Environmental Impact Report (EIR). Analysis detail is appropriate for an EIR level hydrology study.

This report discusses the methodology and assumptions for the hydrologic analysis performed for the Project. Discussion and comparison of existing and proposed hydrologic conditions identifies qualitative and quantitative Project impacts on local hydrologic conditions.

The hydrologic analysis was completed per the June 2003 *San Diego County Hydrology Manual*. Existing conditions hydrologic modeling was completed. Proposed conditions were determined to be identical within the accuracy of hydrology calculations, therefore, no impacts were identified.

1.0 PROJECT DESCRIPTION

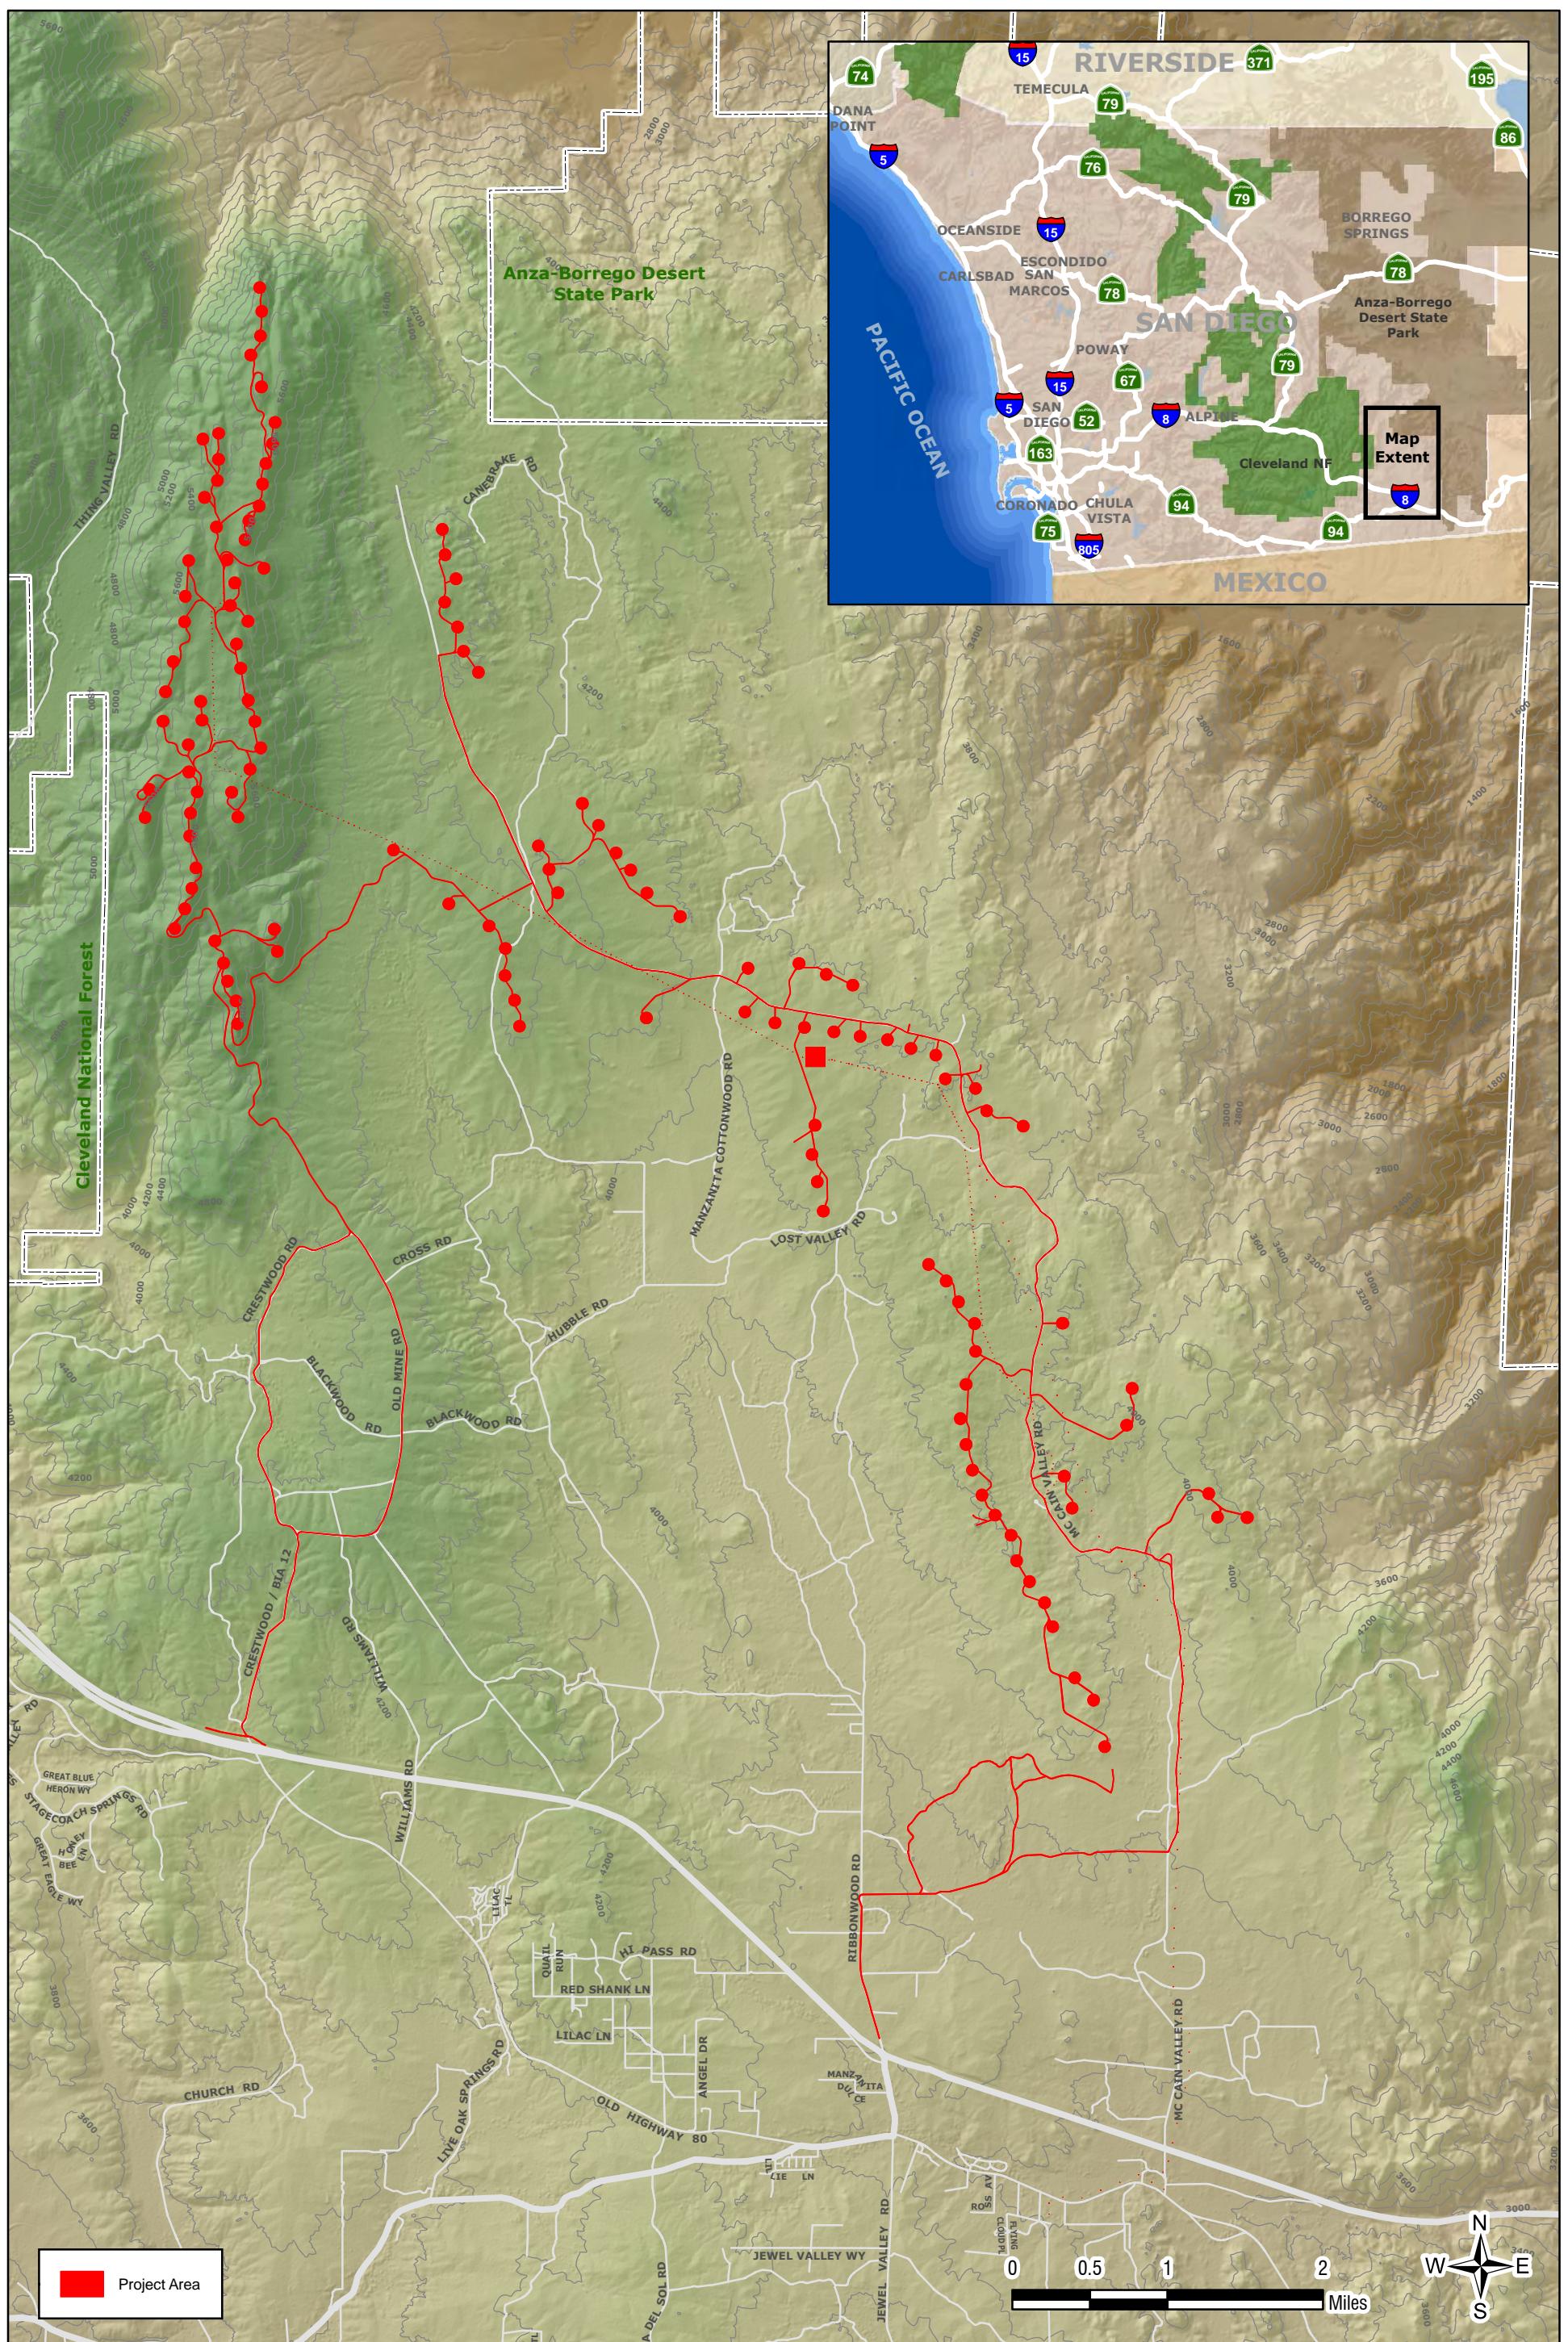

The Tule Wind Project proposes to develop a wind turbine “farm” for power generation, in the County of San Diego in the State of California. The project area is located in the eastern portion of San Diego County, approximately 50 miles east of City of San Diego, 90 miles west of Arizona, and north of the community of Boulevard (see Figure 1). The area is accessible via Interstate 8 (I-8), State Route 94 (SR-94) and Ribbonwood Road junction, and McCain Valley Road off of Old Highway 80. The majority of the project area lies in the In-Ko-Pah Mountains adjacent to the Tecate Divide, south of the Cleveland National Forest. The topography of the area is gently-to-steep sloping with an elevation ranging between about 3,600 and 5,600 feet above mean sea level. The project area contains lands administered by the BLM, the Ewiaapaayp Reservation, the Campo and Manzanita Reservations (access only), the California State Lands Commission (CSLC), and privately-owned parcels under the jurisdiction of the County of San Diego.

Under existing conditions the Project site is mainly undeveloped naturally vegetated rocky hills. A number of existing access roads traverse the area, providing service routes to existing utility facilities, rural houses, agricultural facilities, and a landing strip. Naturally occurring native vegetation is predominant throughout the site, with periodic scattered unvegetated rock outcroppings.

Development will consist of up to 128 wind turbines, 34.5 kilovolt (kV) overhead and underground collector lines, 138 kV overhead transmission line, 5-acre collector substation site, 5-acre operation and maintenance building site, access road between turbines, improvements to existing roads to provide site access, 5-acre temporary batch plant, 10-acre temporary parking lot, 19 2-acre lay down areas, two meteorological towers, and a sonic detection and ranging system (SODAR) unit. Proposed site configuration is shown in Figure 2.

Project development proposes wind turbines ranging in size between 328 feet in height to 492 feet in height, to produce 200 megawatts total power. Turbines are constructed with a 48-foot diameter concrete foundation. Concrete foundations slope away from the centrally located turbine and will be buried greater than half a foot, so that exposed concrete foundations are approximately 6-inches to 8-inches thick and 18-feet to 20-feet in diameter. Turbines also include five-foot by nine-foot concrete pads for transformer foundations. Graded dirt pads around the turbines will be approximately 200-feet in radius.

Access roads between turbines will be 36-feet wide to accommodate self propelled cranes and supply trucks, while access roads to the turbine strings will only need to be 24-feet wide, as the crane and other assembly equipment can be brought onsite in pieces. Thirty-six foot access roads between turbines are intended to be temporary for construction activities and will be allowed to revegetate to a 20-foot width, pending construction completion. Roads under San Diego County jurisdiction will revegetate to a 24-foot width to comply with County standards. Proposed access road alignments will follow existing access roads to the maximum extent practicable to limit the amount of additional disturbed areas. New access roads will follow existing contours to maximum extent practicable to limit the amount of disturbed areas resulting from grading cuts.

Region and Vicinity

FIGURE 1

Tule, LLC | Tule Wind Project

1.0 Project Description

Electrical collector lines for the Project will be a combination of overhead and buried, with a majority being buried. Overhead collector lines will be supported by single steel or wood poles; typically 60-feet to 80-feet in height. Foundation footprints for collector line poles will be similar to the diameter of the pole itself. Collector line temporary disturbed widths are assumed to be 24-feet to allow construction vehicle access and trenching or pole erection. Transmission lines will be carried by approximately 75-foot tall poles spaced 600-feet to 700-feet. Temporary transmission line disturbed areas are assumed to be 24-feet to allow construction vehicle access and pole erection. After construction native vegetation will be established over collector line and transmission line access roads. All buried collector lines will be completely re-vegetated.

Temporary parking lot, batch plant, and lay down areas will be re-vegetated to existing conditions and are not deemed a permanent impact. In addition, all naturally occurring vegetation around proposed grading and facilities will be returned to a naturally vegetated state upon completion of construction activities.

Project development will increase impervious areas by a very small amount. Each turbine pad represents approximately 360 square feet of impermeable area. Overall Project development proposes to increase impervious area by approximately 55,000 square feet or 0.3% for the overall 513 acre site. Permanent Project impacts investigated for drainage are approximately 513-acres.

2.0 DRAINAGE PATTERNS

Existing and proposed drainage patterns are defined below.

2.1 EXISTING DRAINAGE PATTERNS

A number of existing streams will convey flows generated by the Project. A majority of the Project drains to the east ultimately discharging into the Salton Sea. Approximately one sixth of the Project drains runoff to the west, ultimately discharging into the Pacific Ocean at the Tijuana Estuary.

A northeastern ridgeline crosses the easterly draining portions of the Project, dividing Salton Sea bound flows southwest into Tule Creek and northeast into Carrizo Wash, Bow Willow Creek, and Canebrake Wash. Approximately one third of the Project drains to Tule Creek via McCain Valley and Lark Canyon. Tule Creek flows are conveyed southeast into Tule Lake, which discharges into Tule Canyon, then converges with Carrizo Wash in Carrizo Gorge. Basin No. 100 and 200 drain to Canebrake Wash, a tributary to Vallecito Creek, which conveys flows into Carrizo Wash. Basin 1300 conveys flows southerly under Interstate 8 into Walker Creek, which then conveys flows northeasterly into Carrizo Wash. All flows in Carrizo Wash are then conveyed into San Felipe Creek and the Salton Sea. The Salton Sea is a minimum of approximately 45 miles downstream of the Project.

Westerly draining flows (Simmons Canyon, Unnamed Western Wash, and Basin No. 300 - 1000) are conveyed into La Posta Creek, which conveys flows into Cottonwood Creek, discharging into Lake Morena. The dam at Lake Morena discharges back into Cottonwood Creek, which then discharges into Barrett Lake. Barrett Lake dam releases flows back into Cottonwood Creek, which discharges into the Tijuana River and into the Pacific Ocean. Cottonwood creek is a natural unconfined stream. Lake Morena is a minimum of approximately 14 miles downstream of the Project.

Southerly draining flow (Basin No. 1100) is conveyed into Miller Creek, which conveys flows into Campo Creek, which then conveys into Tijuana River and into the Pacific Ocean. Both the Miller Creek and Campo Creek are natural streams.

2.1.1 Tule Creek Basin

Tule Creek Basin containing the Project site includes an expansive upstream area draining approximately 18,250 acres and has an approximately 12.1 mile long flow path. The highest upstream point in the basin is at approximately 5,800 feet and the downstream most point is at approximately 3,475feet. Upper reaches of Tule Creek and its tributaries are generally fairly steep and confined to mountainous gullies. Tule Creek in the vicinity of the Project flattens out and takes on the form of a meandering stream in a wider valley with floodplains and flatter fields.

Runoff sheet flows across the ground surface until it encounters rivulets which then discharge into larger streams which ultimately discharge into Tule Creek. Precipitation that falls on typical access roads sheet flows off the side of the road where it is collected either in swales running parallel to the road or sheet flows across the surrounding terrain. Swales carry runoff to streams crossing the access road, where it is then conveyed to Tule Creek. There are no major improvements to the drainage features within the basin. However, a number of culverts have been installed on the northeast portion of the drainage basin to facilitate the construction of access roads across the smaller drainage features. An unnamed tributary to Tule Creek along the northeastern edge of the basin crosses a number of public and private roads via culverts just east of the landing strip. Crossings relevant to this Project include two 36-inch culverts for a private road and one 36-inch culvert for McCain

2.0 Drainage Patterns

Valley Road. Several access roads utilize a depressed on grade type crossing, where flows are conveyed across the top of the road, rather than constructing culverts to carry flows under the road. An existing access road crossing Tule Creek within the Project limits near the downstream half of the basin has this type of crossing.

2.1.2 Bow Willow Creek North

Northern portions of the Project site lie within an approximately 2,747 acre basin, having an approximately 4.9 mile long flow path. The highest upstream point in the basin is at approximately 5,620 feet and the downstream most point is at approximately 3,930 feet. Upper reaches of Bow Willow Creek North and its tributaries are generally fairly steep and confined to mountainous gullies. The stream makes its way across a north to south fractured landscape, gaining flow from numerous tributaries. Flow continues generally to the southeast, where it leaves the limits of this study and merges with other washes to form Bow Willow Creek.

Runoff sheet flows across the ground surface until it encounters rivulets which then discharge into larger streams which ultimately discharge into Bow Willow Creek North. Precipitation that falls on typical access roads sheet flows off the side of the road where it is collected either in swales running parallel to the road or sheet flows across the surrounding terrain. Swales carry runoff to streams crossing the access road, where it is then conveyed to natural drainages. There are no major improvements to the drainage features within the basin.

2.1.3 Bow Willow Creek South

Northern portions of the Project site lie within an approximately 5197 acre basin, having an approximately 6.55 mile long flow path. The highest upstream point in the basin is at approximately 5,640 feet and the downstream most point is at approximately 3,410 feet. Upper reaches of Bow Willow Creek South and its tributaries are generally fairly steep and confined to mountainous gullies. The stream makes its way across a north to south fractured landscape, gaining flow from numerous tributaries. Flow continues generally to the southeast, where it leaves the limits of this study and merges with other washes to form Bow Willow Creek.

Runoff sheet flows across the ground surface until it encounters rivulets which then discharge into larger streams which ultimately discharge into Bow Willow Creek South. Precipitation that falls on typical access roads sheet flows off the side of the road where it is collected either in swales running parallel to the road or sheet flows across the surrounding terrain. Swales carry runoff to streams crossing the access road, where it is then conveyed to natural drainages. There are no major improvements to the drainage features within the basin.

2.1.4 Unnamed Northern Wash

Eastern portions of the Project site lie within an approximately 1542 acre basin that drains to an unnamed wash. Basin drainage has a maximum flow path of approximately 2.5 miles, with a maximum elevation of 4156 feet and a minimum elevation of 3765 feet. The Unnamed Northern Wash basin drains to confined mountainous gullies that are steep and rocky.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet flow into small rivulets that will join with surrounding streams and eventually discharge into Carrizo Wash. Roads in the Unnamed Northern Wash basin are primarily double track trails and do not have any associated drainage improvements.

2.1.5 Unnamed Eastern Wash

Eastern portions of the Project site lie within an approximately 734 acre basin that drains to an unnamed wash. Basin drainage has a maximum flow path of approximately 1.9 miles, with a maximum elevation of 4,125 feet and a minimum elevation of 3,620 feet. The Unnamed Eastern Wash basin drains to confined mountainous gullies that are steep and rocky.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet flow into small rivulets that will join with surrounding streams and eventually discharge into Carrizo Wash. Roads in the Unnamed Eastern Wash basin are primarily double track trails and do not have any associated drainage improvements.

2.1.6 Unnamed Western Wash

Western portions of the Project site lie within an approximately 1440 acre basin that drains to an unnamed wash. Basin drainage has a maximum flow path of 2.06 miles, with a maximum elevation of 4,795 feet and a minimum elevation of 4,140 feet. Upper reaches of Unnamed Western Wash and its tributaries are generally fairly steep and confined to mountainous gullies. The lower reaches are significantly less steep and are crossed numerous times by unimproved dirt tracks. A small earthen impoundment just outside of the study area creates ponding in the extreme lower reach.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet flow into small rivulets that will join with surrounding streams and eventually leave the analyzed portion of the basin and discharge into La Posta Creek. Roads in the Unnamed Western Wash basin are primarily double track trails and do not have any associated drainage improvements.

2.1.7 Simmons Canyon

Western portions of the Project site lie within an approximately 878 acre basin that drains to Simmons Canyon Creek. Basin drainage has a maximum flow path of 2.19 miles, with a maximum elevation of 5,652 feet and a minimum elevation of 4,120 feet. The entire reach of Simmons Canyon and its tributaries are generally fairly steep and confined to mountainous gullies.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet flow into small rivulets that will join with surrounding streams and eventually discharge into La Posta Creek. Roads in the Simmons Canyon basin are primarily double track trails and do not have any associated drainage improvements.

2.1.8 Basin 100 and 200

Basins 100 and 200 are approximately 86 and 375 acres, respectively in size and drain to Canebrake Wash, a tributary of Carrizo Wash. Both generally drain mountainous and rocky terrain to the north of the Project site and have maximum elevations of around 5665 feet.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet into small rivulets, combining with other runoff, into larger and larger flows. These flows confluence into the major drainages of these basins and confluence to the major course of flow for the analyzed basin. There are few current roads in these basins and have no improved drainage features.

2.1.9 Basins 300 to 800

Basins 300 to 800 range in size from 73 to 475 acres and lie west of the Tecate Divide. These basins drain western portions of the project area, contributing flows to La Posta Creek. Beginning in

2.0 Drainage Patterns

confined mountain ravines, these flows meet La Posta Creek in Thing Valley. Basins 300 to 500 are first to join La Posta Creek, and do so within a reach of less than 2000 feet. Basin 600 empties to La Posta Creek 4,500 feet below Basin 500, followed by Basin 700 1200 feet downstream. Basin 800 is the last to directly join La Posta Creek about a mile downstream of Basin 700.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet into small rivulets, combining with other runoff, into larger and larger flows. These flows confluence into the major drainages of these basins and confluence to the major course of flow for the analyzed basin. There are few current roads in these basins and have no improved drainage features.

2.1.10 Basin 900 and 1000

Basins 900 and 100 are approximately 188 and 101 acres, respectively and drain western portions of the Project site. These basins contribute flows to Simmons Canyon Creek, a tributary to La Posta Creek. Both drain mountainous and rocky terrain, with maximum elevations of over 5600 feet. There two systems converge shortly downstream of the studied area, where they flow for approximately 2.5 miles prior to meeting Simmons Canyon Creek. After joining Simmons Canyon, these flows continue another 1.5 miles before joining La Posta Creek.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet into small rivulets, combining with other runoff, into larger and larger flows. These flows confluence into the major drainages of these basins and confluence to the major course of flow for the analyzed basin. There are few current roads in these basins and have no improved drainage features.

2.1.11 Basin 1100

Basin 1100 is 635 acres in size and drains southern portions of the Project site, specifically an alternative access road leading from Interstate-8. The basin has a maximum elevation of 4,580 feet and a flow path of 1.52 miles. The main flow path flows through an open and gently sloped valley. The studied basin terminates upon intersection with Interstate-8, where flows pass via culvert.

Drainage patterns are similar to the previously discussed basins; precipitation will sheet flow into small rivulets that will join with surrounding streams and eventually merge to form the main flow leaving the studied area. Roads in the basin vary from double track trails to improved surface roads.

2.1.12 Basin 1200

A portion of the Project site is located in an approximately 484 acre basin that drains to Carrizo Gorge. The drainage basin has a maximum flow path of 1.5 miles with a maximum elevation of 4,065 feet and a minimum elevation of 3,200 feet. A ridge divides the basin into a northern and southern portion, each draining into two respective streams. Both streams then join at a confluence at the bottom of the drainage basin, as shown on Exhibit A. Topography for Basin 1200 is mountainous with streams confined in steep gullies.

Generally, drainage is similar to the Unnamed Basin East and other easterly draining basins; Rainfall sheet flows into rivulets and then into larger streams. Terrain is predominantly rocky and steep and will not provide substantial opportunity for infiltration. There are an extremely limited number of roads in the basin; most are single track trails. There are no existing improvements to the drainage features in the basin, given the limited amount of development in the basin.

2.1.13 Basin 1300

Portions of the Project are located in an approximately 71 acre basin immediately north of Interstate 8 surrounding Ribbonwood Road. Flows generated from Basin 1300 are conveyed southerly under Interstate 8 and into Walker Creek. Walker Creek flows to the east and discharges into Carizzo Wash, which conveys flows northerly.

Drainage from Basin 1300 is facilitated similarly to the rest of the Project, with rainfall sheet flowing into rivulets and then into larger streams. Terrain is somewhat flat with a number of scattered graded pads for rural houses and barns. Ribbonwood Road crosses through the basin along with a number of private rural access roads. There are a number of culvert crossings for access road crossing of minor drainages.

2.2 PROPOSED DRAINAGE PATTERNS

Proposed Project improvements will aim to mimic existing drainage patterns and will minimize redirection of any flows. Improvements include graded pads, access roads, utility lines, and engineered crossings at each drainage feature. Project improvements propose minimal additional impervious areas. Any increase in runoff resulting from these impacts is assumed to be negligible, from a flood impact standpoint, with water quality impacts addressed in the Storm Water Management Plan published under a separate cover by HDR.

2.2.1 Tule Creek Basin

Tule Creek Basin drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 0.95% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads will be improved or created throughout the basin connecting multiple strings of turbines. McCain Valley road serves as a central corridor for this access. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 14,366 square feet impervious areas or 0.002% of basin total area). Impervious areas include the area of 40 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located mainly in the northeastern corner of the basin. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.2 Bow Willow Creek North

Bow Willow Creek North drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.1% of the area. Existing drainage patterns within the basin will be substantially maintained.

2.0 Drainage Patterns

Two main roads are proposed to provide access to two strings of turbines. One parallels McCain Valley Road and the other is to follow the ridge on the western edge of the basin. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 3,771 square feet impervious areas or 0.003% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 10.5 turbine pads (some pads are located on basin boundaries). Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located mainly in the western and center of the basin, following the two strings of turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.3 Bow Willow Creek South

Bow Willow Creek South drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.6% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect multiple strings of turbines, mainly to the west and south, roughly along the present course of McCain Valley Road. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 7,722 square feet impervious areas or 0.003% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 21.5 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located mainly in the western and southern portions of the basin, connecting the strings of turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.4 Unnamed Northern Wash Basin

Unnamed Northern Wash Basin drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 4.0% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect multiple strings of turbine, mainly along the northern and western boundaries. As with most of the east basins, McCain Valley Road serves as the main corridor to which strings of turbines connect. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 13,849 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 13.5 turbine pads, 1 O&M facility and 1 substation. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines and the substation. Transmission lines leaving the substation are also proposed. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.5 Unnamed Eastern Wash Basin

Unnamed Eastern Wash Drainage Basin drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.6% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect two strings of turbines, located roughly in the center of the basin. These connect to McCain Valley Road. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,077 square feet impervious areas or 0.003% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 3 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Transmission lines traverse the basin. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.6 Unnamed Western Basin Drainage Pattern

Unnamed Western Wash Drainage Basin drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 0.7% of the area. Existing drainage patterns within the basin will be substantially maintained.

Two existing access roads cross the site, North to South, and represent the only project improvements in the basin. There are no turbines, facilities, or transmission lines located in this basin. Precipitation falling on the exposed portions of the roads will sheet flow off the roads as under current conditions and flow into surrounding brow ditches/swales.

2.2.7 Simmons Canyon Basin

Simmons Canyon Basin drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 2.2% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect two strings of turbines, located in the northern portion of the basin. Two other access roads cross the basin to the south. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,616 square feet impervious areas or 0.004% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 4.5 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.8 Basin 100

Basin 100 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 7.3% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect a single string of turbines, located in the western edge of the basin. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 718 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 2 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.9 Basin 200

Basin 200 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 2.4% of the area. Existing drainage patterns within the basin will be substantially maintained.

2.0 Drainage Patterns

Access roads connect a single string of turbines, located in the eastern edge of the basin. Drainage of this access road will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,077 square feet impervious areas or 0.007% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 3 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.10 Basin 300

Basin 300 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 8.5% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connect two strings of turbines, located in the center and eastern edge of the basin. Drainage of access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,975 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 5.5 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.11 Basin 400

Basin 400 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.5% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects one turbine located on the basin boundary. Drainage of this access road will be facilitated by brow ditches/swales parallel to the proposed road, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 539 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 1.5 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff

will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.12 Basin 500

Basin 500 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 6.9% of the area. Existing drainage patterns within the basin will be substantially maintained.

Access roads connects two strings of turbines located through the center and on the basin's eastern boundary. Drainage of these access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,077 square feet impervious areas or 0.01% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 3 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.13 Basin 600

Basin 600 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 2.1% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects one string of turbines located on the basin's eastern boundary. Drainage of this access road will be facilitated by brow ditches/swales parallel to the proposed road, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 359 square feet impervious areas or 0.005% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 1 turbine pad. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.14 Basin 700

Basin 700 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 2.8% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects one string of turbines located on the basin's eastern boundary. Drainage of this access road will be facilitated by brow ditches/swales parallel to the proposed road, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 359 square feet impervious areas or 0.01% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 1 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.15 Basin 800

Basin 800 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 8.1% of the area. Existing drainage patterns within the basin will be substantially maintained.

Multiple access roads connect strings of turbines located on the basin's northern, eastern, and southern boundary. Drainage of these access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 4,310 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 12 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.16 Basin 900

Basin 900 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 6.5% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects one string of turbines located on the basin's northern boundary. Drainage of this access road will be facilitated by brow ditches/swales parallel to the proposed road, which will convey flows to existing surface drainage features.

2.0 Drainage Patterns

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 1,257 square feet impervious areas or 0.02% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 3.5 turbine pad. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.17 Basin 1000

Basin 1000 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.9% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects one string of turbines located on the basin's northern boundary. Another access road traverses the basin north to south through the center. Drainage of these access roads will be facilitated by brow ditches/swales parallel to proposed roads, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 180 square feet impervious areas or 0.004% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 0.5 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.18 Basin 1100

Basin 1100 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 0.8% of the area. Existing drainage patterns within the basin will be substantially maintained.

A single access road connects traverses the basin from north to south, roughly in the center. The road is to be improved, but currently exists. Drainage of this access road will be facilitated by brow ditches/swales parallel to the road, which will convey flows to existing surface drainage features, as it does currently. There are no turbines, facilities, or transmission lines located in this basin.

2.2.19 Basin 1200

Basin 1200 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.2% of the area. Existing drainage patterns within the basin will be substantially maintained.

2.0 Drainage Patterns

A single access road connects one string of turbines located on the basin's northern boundary. Drainage of this access road will be facilitated by brow ditches/swales parallel to the proposed road, which will convey flows to existing surface drainage features.

Precipitation falling on the exposed portions of the turbine pads will sheet flow off the proposed features and finished surfaces (a total of roughly 718 square feet impervious areas or 0.003% of basin total area) to surrounding brow ditches/swales. Impervious areas include the area of 2 turbine pads. Runoff from exposed turbine pads will drain through a layer of gravel surrounding each pad. Runoff will then be directed into the surrounding existing natural drainage features, with overall flow patterns intended to mimic existing drainage features.

Proposed collector lines will be located in conjunction with the turbines. Minor effects on drainage patterns will only be prevalent during construction. Once the collector lines are either hung or buried the surrounding vegetation and grades will be restored to existing conditions. In the long term, existing drainage patterns within the basin will be maintained.

2.2.20 Basin 1300

Basin 1300 drainage patterns will not be altered significantly in proposed conditions. Almost all flow generated by the basin is from existing areas with proposed improvements taking up less than 1.4% of the area. Existing drainage patterns within the basin will be substantially maintained.

Improvements will be completed to Ribbonwood Road, which will maintain the existing alignment. Drainage of the improved Ribbonwood Road will remain unchanged, with existing flow patterns maintained. There are no turbines, facilities, or transmission lines located in this basin.

3.0 HYDROLOGY

Hydrologic analysis was completed for the entire project area in order to determine a baseline existing condition and to account for changes due to proposed development. The three distinct watersheds dividing the project area were studied for existing and proposed conditions. Sub-basins formed by grading and requiring a hydraulically designed road crossing structure were analyzed under proposed conditions.

3.1 HYDROLOGY METHODOLOGY

Existing and proposed hydrology calculations were both completed per the *San Diego County Hydrology Manual*, June 2003 Rational Method criteria. A summary of the hydrology criteria is presented in Table 2. Appendix A contains *County of San Diego Hydrology Manual* runoff coefficient, rainfall intensity, and overland flow time of concentration figures used in calculations.

Table 1: Hydrology Methodology

Land Use:	SANDAG provided land use overlay dated 2009 and associated cover descriptions in Table 4-2 of 2003 <i>County of San Diego Hydrology Manual</i> .
Precipitation Zone Number	Per PZN Map (Appendix C) of 2003 <i>County of San Diego Hydrology Manual</i> .
Design Storm:	100 year.
Rainfall Intensity:	Per Isopluvial Maps (Appendix B) of 2003 <i>County of San Diego Hydrology Manual</i> .
Soil Data:	NRCS, SSURGO Database
Topographic Data:	2' Project Flown Contours 20' IFSAR Topo provided by SANDAG

Land use was defined based on data provided by SANDAG, which was then used to select the runoff coefficient from Table 4-2 of the *County of San Diego Hydrology Manual*. Soil type data was derived from the Natural Resources Conservation Service (NRCS) Soil Survey Geographic (SSURGO) Database for California. Rainfall intensities and Precipitation Zone Numbers (PZN) were taken from Appendices B and C of the *County of San Diego Hydrology Manual*, respectively.

ArcMap 9.3.1 was utilized to process all geographic data and to determine appropriate inputs for hydrologic modeling. Existing and proposed drainage basins, flow paths and basin area centroids were all developed within ArcMap. The hydrologic modeling was completed through the use of Civil Design Hydrology software (CivilID) and the San Diego County specific module.

3.2 EXISTING CONDITIONS

3.2.1 Universal Unit Hydrograph

The Universal Unit Hydrograph Method was used to analyze all nodes with basins larger than 640 acres. Basin areas, flow path lengths and length to centroid values were all determined using ArcMap.

Area averaged rainfall intensities were determined for each individual basin for the 100-year 24-hour and 100-year 6-hr events. Precipitation zone numbers (PZN), important in San Diego County's method for curve number adjustment, were interpolated for each basin using the basin area centroid.

An area averaged composite runoff curve number (CN) was determined for each basin through tabulating data for combinations of land use and soil type. Land use information was matched to the

cover descriptions assigned in the *County of San Diego Hydrology Manual*, Table 4-2 and were verified through site visits. Curve numbers were manually adjusted per Tables 4-6 and Table 4-10 of the *County of San Diego Hydrology Manual*, using the interpolated PZN values.

Basin lag time was entered into CivilD directly and calculated independently using the United States Army Corps of Engineers (Corps lag) empirical equation, as referenced in *County of San Diego Hydrology Manual*.

Separate hydrologic models were created for the 100-year 24-hour and 100-year 6-hr events, with the intent of determining the maximum peak discharge of the two.

3.2.2 Rational Method

The San Diego County 2003 Rational Method program within CivilD was utilized in calculating runoff for all basins smaller than 640 acres in size. Initial areas and basin subareas were developed within ArcMap per the *County of San Diego Hydrology Manual*.

The 6-hr and 24-hour rainfall intensities were determined through the interpolation of isopluvial information using the basin area centroid.

Land use development type was assumed to be low density residential, specifically, one density unit per acre or less, with an impervious fraction of 10%. Per the *County of San Diego Hydrology Manual* this is the land use type to be used for open undeveloped areas. Soil type data was again derived from the NRCS SSURGO Database and analyzed for each basin subarea for model input.

3.3 PROPOSED CONDITIONS

3.3.1 Universal Unit Hydrograph

Identical methods and assumptions were made for proposed conditions Unit Hydrograph analysis. Disturbed areas due to proposed conditions were assumed to be bare earth for the cover description. Composite curve numbers were recalculated to account for proposed conditions. It was determined that the PZN adjusted curve numbers for input into CivilD were within rounding error of the existing condition curve numbers and therefore proposed conditions results did not vary from existing conditions results (see Appendix D). As stated in the Section 1.0 Project Description, drainage analysis conservatively included the cumulative proposed impacts from multiple alternatives. This is a further indication that actual differences between existing and proposed conditions are even closer than the rounding errors determined in this study, and again indicating that drainage patterns within the Project area will be maintained. See Appendices B and D to review existing and proposed summaries.

3.3.2 Rational Method

Identical methods and assumptions were made for proposed conditions Rational Method analysis. Existing conditions assumed a land use development type of low density residential, specifically, one density unit per acre or less, with an impervious fraction of 10%. Proposed conditions would not increase developed density or impervious fraction past the 10% threshold, and therefore proposed condition results would not vary from existing conditions results. Existing drainage patterns within the Project area will be maintained.

3.4 HYDROLOGY RESULTS

Existing condition hydrology results are summarized for each major drainage basin/system in Table 3 and Table 4. Per *County of San Diego Hydrology Manual* methodology, inputs for modeling proposed conditions did not vary from existing conditions. As such existing and proposed runoff was identical. Due to small overall project footprint, even smaller impervious area increases, and the imprecise nature of current hydrologic modeling, this conclusion is justified. See Appendix C for CivilD output.

Table 2: Existing Conditions Hydrology Results, Unit Hydrograph

Basin	Area (acres)	Adjusted PZN (>35yr)	Adjusted CN (>35yr)	Peak Flow (cfs)
Tule Creek	18250	2.58	82	12730
Bow Willow Creek North	2747	2.63	90	3058
Bow Willow Creek South	5197	2.60	88	8127
Northern Unnamed Wash	1542	2.49	83	1428
Eastern Unnamed Wash	734	2.45	85	808
Western Unnamed Wash	1440	2.70	80	2052
Simmons Canyon	878	2.77	89	1684

Table 3: Existing Conditions Hydrology Results, Rational Method

Basin / System	Area (acres)	Effective C Value	Discharge (cfs)
100	86.22	0.36	138.5
200	375.66	0.384	736.254
300	241.52	0.358	239.447
400	73.46	0.372	195.488
500	191.71	0.365	320.324
600	164.61	0.345	412.396
700	122.03	0.342	295.442
800	475.25	0.351	710.737
900	188.92	0.355	336.506
1000	102.10	0.36	200.22
1100	635.56	0.315	759.278
1200	485.64	0.393	422.228
1300	70.62	0.32	67.93

4.0 CONCLUSION

Based on a preliminary investigation of the proposed Project plan and the existing drainage patterns, impacts from proposed development are less than significant. Project development will not significantly affect existing drainage patterns and the amount of redirected flows will be minimal. Increases in runoff resulting from low frequency storm events associated with flooding will be less than significant, due to the limited amount of proposed impervious area.

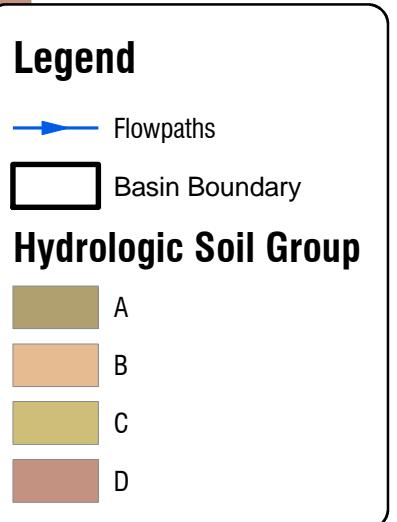

Additional hydrologic and hydraulic analysis will be completed for the Project to determine flow rates at specific locations within the studied basins in order to size proposed drainage facilities.

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
18250.00 3.36

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
18250.00	1.000	82.0	82.0	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 81.960
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 18250.00(Ac.)

Catchment Lag time = 1.700 hours

Unit interval = 15.000 minutes

Unit interval percentage of lag time = 14.7059

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 81.960

Rainfall depth area reduction factors:

Using a total area of 18250.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 0.974

Rainfall entered for study = 3.360(In)

Adjusted rainfall = 3.272(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

where:

Q = direct runoff, *P* = depth of precipitation, *I_a* = Initial Abstraction and *S* is the watershed storage in inches. *S* and *I_a* are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad I_a = 0.2 \text{ s}$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, f_m , exceeds the normal loss rate of $\Delta P(dP) - \Delta Q(dQ)$ then the $dP-dQ$ column equals $f_m = 0.000(\text{In})$ (for time interval = 0.000(\text{In})) and the revised runoff is shown in the last column.

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - I_a)^2}{P - I_a + S}$$

Where:

Q = direct runoff, P = depth of precipitation, I_a = Initial Abstraction and S is the watershed storage in inches. S and I_a are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad I_a = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, f_m, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals f_m = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall (In)	Total Runoff (In)	SCS	Rainfall Amount (In)	Runoff Amount (In)	Infiltration (In)	Revised Runoff (In)	Min Loss Rate
---------------------	---------------------	-------------------	-----	----------------------	--------------------	-------------------	---------------------	---------------

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
2747.00 3.26

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
2747.00	1.000	89.8	89.8	0.050	C

Area-averaged catchment SCS Curve Number AMC(2) = 89.800
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user
Watershed area = 2747.00(Ac.)
Catchment Lag time = 0.800 hours
Unit interval = 5.000 minutes
Unit interval percentage of lag time = 10.4167
Hydrograph baseflow = 0.00(CFS)
Minimum watershed loss rate(Fm) = 0.000(In/Hr)
Average adjusted SCS Curve Number = 89.800

Rainfall depth area reduction factors:
Using a total area of 2747.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used
Areal factor ratio (rainfall reduction) = 1.000
Rainfall entered for study = 3.260(In)
Adjusted rainfall = 3.260(In)

BWN100Yr6Hr.out

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal

BWN100Yr6Hr.out
 loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column
 equals fm = 0.000(In) (for time interval = 0.000(In)) and the
 revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P	Total Runoff SCS Q	Rainfall Amount dP	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
2747.00 6.43

Rainfall Distribution pattern used in study:
Type B for San Diego area of California

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
2747.00	1.000	89.8	89.8	0.050	C

Area-averaged catchment SCS Curve Number AMC(2) = 89.800
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user
Watershed area = 2747.00(Ac.)
Catchment Lag time = 0.800 hours
Unit interval = 5.000 minutes
Unit interval percentage of lag time = 10.4167
Hydrograph baseflow = 0.00(CFS)
Minimum watershed loss rate(Fm) = 0.000(In/Hr)
Average adjusted SCS Curve Number = 89.800

Rainfall depth area reduction factors:
Using a total area of 2747.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used
Areal factor ratio (rainfall reduction) = 1.000
Rainfall entered for study = 6.430(In)
Adjusted rainfall = 6.430(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal

BWN100Yr24Hr.out
loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column
equals fm = 0.000(In) (for time interval = 0.000(In)) and the
revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P	Total Runoff SCS Q	Rainfall Amount dP	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
5197.00 3.37

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
5197.00	1.000	88.0	88.0	0.050	C

Area-averaged catchment SCS Curve Number AMC(2) = 88.050
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 5197.00(Ac.)

Catchment Lag time = 0.940 hours

Unit interval = 10.000 minutes

Unit interval percentage of lag time = 17.7305

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 88.050

Rainfall depth area reduction factors:

Using a total area of 5197.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 3.370(In)

Adjusted rainfall = 3.370(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - I_a)^2}{P - I_a + S}$$

Where:

Q = direct runoff, P = depth of precipitation, I_a = Initial Abstraction and S is the watershed storage in inches. S and I_a are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad I_a = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, f_m, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals f_m = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS dP	Rainfall Amount (In)	Runoff Amount dQ (In)	Infiltration dP-dQ (In)	Revised Runoff Min Loss Rate

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - I_a)^2}{P - I_a + S}$$

Where:

Q = direct runoff, P = depth of precipitation, I_a = Initial Abstraction and S is the watershed storage in inches. S and I_a are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad I_a = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, f_m, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals f_m = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS dP	Rainfall Amount (In)	Runoff Amount dQ (In)	Infiltration dP-dQ (In)	Revised Runoff Min Loss Rate

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
1542.00 3.00

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
1542.00	1.000	82.7	82.7	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 82.730
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 1542.00(Ac.)

Catchment Lag time = 0.490 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 17.0068

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 82.730

Rainfall depth area reduction factors:

Using a total area of 1542.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 3.000(In)

Adjusted rainfall = 3.000(In)

North100Yr6Hr.out

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P	Total Runoff Q	SCS Amount dP	Rainfall Amount dQ	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
1542.00 6.31

Rainfall Distribution pattern used in study:
Type B for San Diego area of California

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
1542.00	1.000	82.7	82.7	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 82.730
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user
Watershed area = 1542.00(Ac.)
Catchment Lag time = 0.490 hours
Unit interval = 5.000 minutes
Unit interval percentage of lag time = 17.0068
Hydrograph baseflow = 0.00(CFS)
Minimum watershed loss rate(Fm) = 0.000(In/Hr)
Average adjusted SCS Curve Number = 82.730

Rainfall depth area reduction factors:

Using a total area of 1542.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used
Areal factor ratio (rainfall reduction) = 1.000
Rainfall entered for study = 6.310(In)
Adjusted rainfall = 6.310(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Q_p vs. T/T_p values into an S-Graph based on lag = T_p/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS Amount dP	Rainfall Amount dQ	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Program License Serial Number 4055

Tule Wind Project
Unnamed Eastern Wash
Existing 100 Year 6 Hour
Aug 25, 2010

+++++
+++++

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
734.00 3.00

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
734.00	1.000	85.1	85.1	0.050	C

Area-averaged catchment SCS Curve Number AMC(2) = 85.130
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 734.00(Ac.)

Catchment Lag time = 0.380 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 21.9298

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 85.130

Rainfall depth area reduction factors:

Using a total area of 734.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 3.000(In)

Adjusted rainfall = 3.000(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - I_a)^2}{P - I_a + S}$$

Where:

Q = direct runoff, P = depth of precipitation, I_a = Initial Abstraction and S is the watershed storage in inches. S and I_a are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad I_a = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, f_m, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals f_m = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS Amount dp	Rainfall Amount dq	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

+++++

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
734.00 5.40

Rainfall Distribution pattern used in study:
Type B for San Diego area of California

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
734.00	1.000	85.1	85.1	0.050	C

Area-averaged catchment SCS Curve Number AMC(2) = 85.130
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 734.00(Ac.)

Catchment Lag time = 0.380 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 21.9298

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 85.130

Rainfall depth area reduction factors:

Using a total area of 734.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 5.400(In)

Adjusted rainfall = 5.400(In)

East100Yr24Hr.out

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall (In) P	Total Runoff (In) Q	SCS Amount dp	Rainfall Amount dQ	Runoff Amount dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Tule Wind Project
Unnamed Western Wash
Existing 100 Year 6 Hour
Aug 25, 2010

+++++
+++++

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
1440.00 3.92

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
1440.00	1.000	79.8	79.8	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 79.840
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 1440.00(Ac.)

Catchment Lag time = 0.310 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 26.881

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 79.840

Rainfall depth area reduction factors:

Using a total area of 1440.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 3.920(In)

Adjusted rainfall = 3.920(In)

West100Yr6Hr.out

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS dP	Rainfall Amount (In)	Runoff Amount dQ (In)	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Program License Serial Number 4055

Tule Wind Project
Unnamed Western Wash
Existing 100 Year 24 Hour
Aug 25, 2010

+++++
+++++

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
1440.00 5.01

Rainfall Distribution pattern used in study:
Type B for San Diego area of California

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
1440.00	1.000	79.8	79.8	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 79.840
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 1440.00(Ac.)

Catchment Lag time = 0.310 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 26.881

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 79.840

Rainfall depth area reduction factors:

Using a total area of 1440.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 5.010(In)

Adjusted rainfall = 5.010(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

Where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall (In) P	Total Runoff (In) Q	SCS dP	Rainfall Amount (In)	Runoff Amount (In) dQ	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Program License Serial Number 4055

Tule Wind Project
Simmons Canyon
Existing 100 Year 6 Hour
Aug 25, 2010

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
878.00 4.12

Rainfall Distribution pattern used in study:
Type B for SCS (small dam) or San Diego 6 hour storms

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
878.00	1.000	88.8	88.8	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 88.780
Area-averaged Fm value using values listed = 0.050(In/Hr)

++++++

Direct entry of lag time by user

Watershed area = 878.00(Ac.)

Catchment Lag time = 0.340 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 24.5098

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 88.780

Rainfall depth area reduction factors:

Using a total area of 878.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 4.120(In)

Adjusted rainfall = 4.120(In)

Simmons100Yr6Hr.out

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) Units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS Amount dP (In)	Rainfall Amount dQ (In)	Runoff Amount dP-dQ (In)	Infiltration (In) dP-dQ	Revised Runoff Min Loss Rate

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

Area averaged rainfall isohyetal data:
Sub-Area(Ac.) Rainfall (In)
878.00 8.00

Rainfall Distribution pattern used in study:
Type B for San Diego area of California

+++++
+++++

***** Area-Averaged SCS Curve Number and Fm *****

Area (Ac.)	Area fract	SCS CN (AMC2)	SCS CN (AMC2)	Fm (In/Hr)	Soil Group
878.00	1.000	88.8	88.8	0.050	B

Area-averaged catchment SCS Curve Number AMC(2) = 88.780
Area-averaged Fm value using values listed = 0.050(In/Hr)
+++++
+++++

Direct entry of lag time by user

Watershed area = 878.00(Ac.)

Catchment Lag time = 0.340 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 24.5098

Hydrograph baseflow = 0.00(CFS)

Minimum watershed loss rate(Fm) = 0.000(In/Hr)

Average adjusted SCS Curve Number = 88.780

Rainfall depth area reduction factors:

Using a total area of 878.00(Ac.) (Ref: SCS Sup A, Sec.4)

Pacific Coastal Climate ratio used

Areal factor ratio (rainfall reduction) = 1.000

Rainfall entered for study = 8.000(In)

Adjusted rainfall = 8.000(In)

+++++

The following unit hydrograph was developed using an S-Graph interpolated by time percentage of lag time vs. percentage of peak flow. The S-Graphs for Valley, Foothill, and Mountain were developed by the U.S. Army Corps of Engineers for use in the respective type of basins located in Southern California. (Hydrology San Gabriel River ... U.S. Engineer Office, Dec 1944, revised Jul 1946) The Desert S-Graph is from Report ... on ... Tahquitz Creek, California, same U.S. office, Corps of Engineers, June 1963. The Valley Developed S-Graph is used by Orange and San Bernardino counties in California to represent the characteristics of valley areas with a large amount of development. Because of the wide variety in topography in Southern California, these synthetic unit hydrographs were included for use as options in any geographic location.

The SCS (Soil Conservation Service Dimensionless S-Graph, SCS handbook, of 1972, applies to a broad cross section of geographic locations and hydrologic regions.

The User Defined hydrograph converts the user Q/Qp vs. T/Tp values into an S-Graph based on lag = Tp/0.9. Then, for the lag time used, the S-Graph is interpolated in time % of lag.

The following S-Graph or S-Graph combination is used in this study:

SAN DIEGO CO. HYDROGRAPH

San Diego Co. Unit Hydrograph Data (III-A-2):
using a constant T/Tp step interval = 0.200

+++++
For each time interval of the 6 or 24 hour storm, the total rainfall up to that storm time is calculated. Then the Soil Conservation Service SCS (report 1972, 1975) area averaged Curve Number (CN) is used to determine the amount of direct runoff in (In) using the following equations:

$$Q = \frac{(P - Ia)^2}{P - Ia + S}$$

where:

Q = direct runoff, P = depth of precipitation, Ia = Initial Abstraction and S is the watershed storage in inches. S and Ia are given by the following equations:

$$S = \frac{1000}{CN} - 10 \quad \text{and} \quad Ia = 0.2 S$$

Note: If Metric (SI) units are used, rainfall data is converted by the program internally into inches for these calculations.

Note: In the following printout, the revised runoff column is only used when the minimum soil loss rate, fm, exceeds the normal loss rate of delta P(dP) - delta Q(dQ) then the dP-dQ column equals fm = 0.000(In) (for time interval = 0.000(In)) and the revised runoff is shown in the last column.

Time Period (hours)	Total Rainfall P (In)	Total Runoff Q (In)	SCS Amount dP (In)	Rainfall Amount dQ (In)	Runoff Amount dP-dQ (In)	Infiltration (In)	Revised Runoff Min Loss Rate

San Diego County Rational Hydrology Program

CIVILCADD/CIVILDESIGN Engineering Software, (c)1991-2004 Version 7.4

Rational method hydrology program based on
San Diego County Flood Control Division 2003 hydrology manual
Rational Hydrology Study Date: 09/01/10

2

SYSTEM 100
100-YEAR EVENT

***** Hydrology Study Control Information *****

Program License Serial Number 4055

Rational hydrology study storm event year is 100.0
English (in-lb) input data Units used

Map data precipitation entered:
6 hour, precipitation(inches) = 3.530
24 hour precipitation(inches) = 7.840
P6/P24 = 45.0%
San Diego hydrology manual 'C' values used

+++++
Process from Point/Station 100.100 to Point/Station 100.200
**** INITIAL AREA EVALUATION ****

Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
[LOW DENSITY RESIDENTIAL]
(1.0 DU/A or Less)
Impervious value, Ai = 0.100
Sub-Area C Value = 0.360
Initial subarea total flow distance = 76.200(Ft.)
Highest elevation = 5664.000(Ft.)
Lowest elevation = 5644.000(Ft.)
Elevation difference = 20.000(Ft.) Slope = 26.247 %
INITIAL AREA TIME OF CONCENTRATION CALCULATIONS:
The maximum overland flow distance is 100.00 (Ft)
for the top area slope value of 26.25 %, in a development type of
1.0 DU/A or Less
In Accordance With Figure 3-3
Initial Area Time of Concentration = 4.48 minutes
TC = [1.8*(1.1-C)*distance(Ft.)^0.5]/(% slope^(1/3))
TC = [1.8*(1.1-0.3600)*(100.000^0.5)/(26.247^(1/3))] = 4.48
Calculated TC of 4.482 minutes is less than 5 minutes,
resetting TC to 5.0 minutes for rainfall intensity calculations
Rainfall intensity (I) = 9.301(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.360
Subarea runoff = 0.301(CFS)
Total initial stream area = 0.090(Ac.)

System100.out

+++++
Process from Point/Station 100.200 to Point/Station 100.300
**** IMPROVED CHANNEL TRAVEL TIME ****

Upstream point elevation = 5644.000(Ft.)
Downstream point elevation = 5557.000(Ft.)
Channel length thru subarea = 456.000(Ft.)
Channel base width = 10.000(Ft.)
Slope or 'z' of left channel bank = 4.000
Slope or 'z' of right channel bank = 4.000
Estimated mean flow rate at midpoint of channel = 6.025(CFS)
Manning's 'N' = 0.040
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 6.025(CFS)
Depth of flow = 0.137(Ft.), Average velocity = 4.164(Ft/s)
Channel flow top width = 11.097(Ft.)
Flow Velocity = 4.16(Ft/s)
Travel time = 1.83 min.
Time of concentration = 6.31 min.
Critical depth = 0.219(Ft.)
Adding area flow to channel
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
[LOW DENSITY RESIDENTIAL]
(1.0 DU/A or Less)
Impervious value, Ai = 0.100
Sub-Area C Value = 0.360
Rainfall intensity = 8.007(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for total area
(Q=KCIA) is C = 0.360 CA = 1.458
Subarea runoff = 11.372(CFS) for 3.960(Ac.)
Total runoff = 11.674(CFS) Total area = 4.050(Ac.)
Depth of flow = 0.203(Ft.), Average velocity = 5.323(Ft/s)
Critical depth = 0.332(Ft.)

+++++
Process from Point/Station 100.300 to Point/Station 100.400
**** IMPROVED CHANNEL TRAVEL TIME ****

Upstream point elevation = 5557.000(Ft.)
Downstream point elevation = 5380.000(Ft.)
Channel length thru subarea = 2269.600(Ft.)
Channel base width = 10.000(Ft.)
Slope or 'z' of left channel bank = 4.000
Slope or 'z' of right channel bank = 4.000
Estimated mean flow rate at midpoint of channel = 45.708(CFS)
Manning's 'N' = 0.040
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 45.708(CFS)
Depth of flow = 0.580(Ft.), Average velocity = 6.392(Ft/s)
Channel flow top width = 14.643(Ft.)
Flow Velocity = 6.39(Ft/s)
Travel time = 5.92 min.
Time of concentration = 12.22 min.
Critical depth = 0.773(Ft.)
Adding area flow to channel
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000

System100.out

Decimal fraction soil group D = 0.000
[LOW DENSITY RESIDENTIAL]
(1.0 DU/A or Less)
Impervious value, Ai = 0.100
Sub-Area C Value = 0.360
Rainfall intensity = 5.225(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for total area
(Q=KCIA) is C = 0.360 CA = 15.246
Subarea runoff = 67.984(CFS) for 38.300(Ac.)
Total runoff = 79.658(CFS) Total area = 42.350(Ac.)
Depth of flow = 0.792(Ft.), Average velocity = 7.633(Ft/s)
Critical depth = 1.078(Ft.)
