Southern California Edison
A.19-07-015 – TLRR IC

DATA REQUEST SET E D - S C E - 0 1 6

To: Energy Division
Prepared by: Scott Lacy
Job Title: Sr. Construction Project Manager
Received Date: 9/9/2024

Response Date: 9/27/2024

Question 16-1:
16-1: Project Description Updates for Removal of Segment 4

We have removed references to Segment 4 from the Project Description that SCE reviewed in late 2023. However, much of the data presented in the PD (taken from the 2020 PEA's Chapter 3) is presented for the project as a whole and not by segment. For example, calculations about water use, access road widening, guard structures, excavation materials, waste materials, and ground disturbance are presented for the project as a whole (including Segment 4). In addition, construction equipment and workforce data is presented for the project as a whole. Please review all of the data provided in Attachment 1 to this letter, and provide tracked changes in the Word file showing the corrected data with Segment 4 removed. The data to be reviewed is highlighted.

Response to Question 16-1:
Please see attachment "A1907015_ED-SCE-016_Q16-1.docx" which displays the tracked changes and corrected data following the removal of Segment 4.

DATA REQUEST SET E D - S C E - 0 1 6

To: Energy Division
Prepared by: Scott Lacy
Job Title: Sr. Construction Project Manager
Received Date: 9/9/2024

Response Date: 9/27/2024

Question 16-2:
16-2: Marker Balls

The PEA states that marker ball locations cannot be defined until consultation with the FAA is complete; see text below. However, SCE's preliminary design includes structure heights and spans, which are used in the FAA determination, so a preliminary determination of marker ball locations can be calculated. Please provide SCE's preliminary estimates of the locations of marker balls based on the FAA criteria defined below (from the PEA). We understand that these may change after FAA consultation. SCE will consult with the FAA and consider recommendations, to the extent feasible. Typical recommendations include, but are not limited to, the following: installation of marker balls on the proposed OPGW between structures), and/or installation of lighting on structures. Generally, marking or lighting is recommended by the FAA for those spans or structures that exceed 200 feet in height above ground level (AGL); however, marking or lighting may be recommended for spans and structures that are less than 200 feet AGL, but located within close proximity to an airport or other high-density aviation environment. FAA recommendations of guidelines and standards for marking and lighting are included in Advisory Circular AC 70/7460-1L

Response to Question 16-2:
SCE completed a preliminary FAA Filing Determination study in 2019, based upon preliminary engineering design. Please see attachment "A1907015_ED-SCE-016_Q16-2.pdf". The study identifies structures and catenaries that would require FAA filing to determine if they are deemed obstructions to air navigation and may potentially receive determinations for locations where lighting or marker balls are recommended to be installed.

DATA REQUEST SET E D - S C E - 0 1 6

To: Energy Division
Prepared by: Scott Lacy
Job Title: Sr. Construction Project Manager
Received Date: 9/9/2024

Response Date: 9/27/2024

Question 16-3:
16-2: PEA Table 3.5-1, Typical Subtransmission Structure Dimensions

The first data column of this table shows "Number of Structures, IC Project." For Segment 1, 905 structures are listed in this column. For Segment 2, 452 structures are listed, but 110 of these are shown as "Temporary." None of the Segment 1 structures are characterized as "Temporary." Please verify that there are no temporary structures planned in Segment 1. If changes are required, please submit an updated Table 3.5-1. If no changes are required to the Segment 1 description, please explain why no temporary structures are required in Segment 1 while 110 temporary structures are required for Segment 2.

Response to Question 16-3:
SCE confirms there are no temporary structures planned in Segment 1. Due to the different circuit configurations and expected construction outage constraints between Segments 1 and 2, the preliminary engineering design created in 2020 incorporated temporary structures in Segment 2 to minimize potential blowout conflicts during construction that were not anticipated in Segment 1. These design and construction assumptions have not changed, therefore SCE did not revise PEA Table 3.5-1 to include any temporary poles in Segment 1.

DATA REQUEST SET E D - S C E - 0 1 6

To: Energy Division
Prepared by: Scott Lacy
Job Title: Sr. Construction Project Manager
Received Date: 9/9/2024

Response Date: 9/27/2024

Question 16-4:
16-4: Cumulative Projects and Deteriorated Pole Program

In SCE's November 2023 review of the Administrative Draft of the Project Description, SCE suggested that the description of the Deteriorated Pole (DP) Program be moved to the Cumulative Projects section. We have made that change and we have removed the Segment 4 data. However, given the time that has passed since the analysis of this project began, this data requires updating. Please see Attachment 2 to this letter. The table in Attachment 2 shows "Planned Installation" of 42 replacement poles occurring in 2023 and 2024. Please provide an updated table that shows 2023 and 2024 replacements as "installed" and not "planned," and update the anticipated status for 2025 and 2026, as needed. The table shows that over 500 structures will have been replaced in Segments 3N and 3S before the end of 2025. Please verify that the GIS data that we have been provided accurately defines structures that will be replaced as part of the I-C Project (separate from those that will have been replaced as part of the DP Program). Please confirm whether the 21 poles that have been replaced under the DP Program in Segments 1 and 2 (where all existing poles are defined as requiring replacement as part of the I-C Project) will be replaced again as part of the I-C Project

Response to Question 16-4A:
Please see the revised table below for the most up-to-date information on the number of deteriorated poles that have been installed or are still planned across Segments 1-3. SCE has replaced 41 out of the grand total of 48 poles planned for replacement in 2023/2024, with the seven poles remaining in Segment 1 scheduled to be replaced by 12/31/2024. (Note: One transmission tower in Segment 1 was incorrectly labeled as a pole in the previous version of the table. This error has been rectified, reducing the total count for Segment 1 to 18. This also reduced the overall project deteriorated pole count from 526 to 525).

Count of Installed or Planned	**Install Years**						
Segments	**2020**	**2021**	**2022**	**2023**	**2024**	**2025**	**Grand Total**
1		**2**	**4**	**3**	**9**		**18**
Installed		2	4	3	2		11
Planned Installation					7		7
2			**2**				**2**
Installed			2				2
3N	**123**	**40**	**84**	**6**	**5**	**34**	**292**
Installed	123	40	84	6	5		258
Planned Installation						34	34
3S	**113**	**18**	**57**	**19**	**6**		**213**
Installed	113	18	57	19	6		213
Grand Total	**236**	**60**	**147**	**28**	**20**	**34**	**525**

SCE Response to 16.4 (B)

Yes, the current GIS accurately defines those structures that are expected to be replaced by the IC Project based on the information currently available.

SCE Response to 16.4 (C)

Yes, SCE anticipates that all poles replaced in Segments 1 and 2 under the DP program will need to be replaced again as part of the IC Project.

DATA REQUEST SET E D - S C E - 0 1 6

To: Energy Division
Prepared by: Scott Lacy
Job Title: Sr. Construction Project Manager
Received Date: 9/9/2024

Response Date: 9/27/2024

Question 16-5:
16-5: Conductor Type and EMF Plan

SCE's comments on the Administrative Draft of the Project Description (late 2023) removed reference to ACCC as the conductor type, stating that the conductor type has not yet been determined. However, the PTC Application, Appendix F (April 2020 Field Management Plan [FMP]) appears to have been developed with the assumption that ACCC conductor would be used in Segments 1, 2, 3N, and 3S. The text (Magnetic Field Assumptions, page F-29) states the following: The current conductor type, ACSR, sags much more than the proposed conductor type, ACCC, resulting in lower EMF values. This generally leads to lower EMF results for the ACCC conductors. Please confirm the conductor type that was used in preparation of the April 2020 FMP. Explain whether (and why) the FMP data is still valid if another type of conductor is used.

Response to Question 16-5:
The April 2020 Field Management Plan (FMP) was prepared based on desktop engineering with information and data points available at that time. While the actual conductor type to be chosen during the final engineering design could be slightly different, the conclusions discussed in the FMP are still valid.

As stated on page 7 of the FMP:

"The calculated results are not intended to be predictors of the actual magnetic field levels at any given time or at any specific location if and when the IC Project is constructed. This is because magnetic field levels depend upon a variety of variables, including load growth, customer electricity usage, and other factors beyond SCE's control. The CPUC affirmed this in D. 06-01-042 stating:

Our [CPUC] review of the modeling methodology provided in the utility [EMF] design guidelines indicates that it accomplishes its purpose, which is to measure the relative differences between alternative mitigation measures. Thus, the ***modeling indicates relative differences in magnetic field reductions*** (emphasis added) *between different transmission line construction methods but does not measure actual environmental magnetic fields."*

Regardless of the specific conductor type that may be utilized, the reduction measures of using taller structures, optimally arranging the phasing, maintaining higher minimum ground clearances,

and derating the lines (in the case of Segment 4) would still be valid in lowering EMF levels compared to levels that would be expected without implementing these measures. Furthermore, as there is no numeric standard for EMF levels at the edge of the right-of-way, the preliminary or final designs were not intended to keep the calculated magnetic field levels under a certain threshold.

Data Request 16, Attachment 1: Project Description Review Required for Segment 4 Removal

The EIR team has attempted to update the first section below (115 kV Subtransmission Poles and Towers) based on elimination of Segment 4. Please review and verify the data shown.

*For all subsequent sections presented in this attachment, we have not been able to update data at all because it was not presented by segment. The data requiring review is highlighted. **Please track changes** in this document to show where information was modified.*

115 kV Subtransmission Poles and Towers

Approximately ~~727~~ 744 TSP and ~~391~~ 397 permanent LWS poles would be installed as part of the Proposed Project.

Formatted: Highlight

…

Approximately ~~128~~ 124 multipole TSP structures (which comprise two or three individual TSPs located at a single site, with each TSP bearing a single circuit or a single conductor) would be used for the Proposed Project, along with approximately ~~76~~ 75 wood H-frame poles. …

The approximate dimensions of the proposed structure types are … summarized in Table B-2 (Summary of Project Subtransmission Structures).

Table Error! No text of specified style in document.**-2. Summary of Project Subtransmission Structures**

Project Component	Number of New Structures	Approx. Height Above Ground (Feet)	Approx. Pole Diameter (Feet)	Approx. Auger Hole Depth (Feet)	Auger Diameter (Feet)	Number of Existing Structures to be Removed	Existing Structures, Approx. Height (Feet)

Source: SCE, PEA Table 3.5-1.

Access Roads and Spur Roads

… Approximately ~~388~~ 306 miles of existing access and spur roads would be employed for construction of the I-C Project. At present, all ~~388~~ 306 miles are projected to require minor rehabilitation work, including regrading and repair of the existing roadbed.

Water Usage and Water Sources

SCE estimates it would use up to a maximum of 3,100 acre-feet of water over the construction period and would likely be less due to refinements in construction scheduling during final engineering. This amounts to approximately 1,000 acre-feet during each calendar year of construction.

Commented [MC1]: We have not revised this information to account for the removal of Segment 4, as this value still remains valid as a maximum volume.

Reusable, Recyclable, and Waste Material Management

Approximately ~~2,054~~1,920 tons of metal (consisting of steel from existing towers and metals from existing conductor) would be removed as part of the Proposed Project, as would approximately ~~37~~ 32 tons of concrete from the foundations of existing towers.

Guard Structures

SCE estimates that ~~305~~ 287 guard structures may need to be temporarily installed for the Proposed Project.

Ground Disturbance Summary

Ground disturbance for the Proposed Project would include all areas affected by construction. It is estimated that the total permanent land disturbance for the Proposed Project would be approximately ~~2,069~~1,755 acres. It is estimated that the Proposed Project would temporarily disturb and restore approximately ~~2,741~~2,172 acres. The estimated amount of land disturbance for each Project component is summarized in Table B-4, Summary of Estimated Ground Disturbance, which summarizes the total disturbance acreage from Tables B-5 through B-8, which address subtransmission lines, substations, telecommunications amplifier site, and access and spur roads, respectively.

Table Error! No text of specified style in document.**-4. Summary of Estimated Ground Disturbance**

Project Feature	Acres Disturbed During Construction	Acres to be Restored	Acres Permanently Disturbed
Subtransmission Lines (from Table B-6)	~~2,730.6~~2,285.4	123.5~~155.9~~	~~1,891.2~~1,614.7

1 Telecommunications pull and tension sites along Segments 1 and 2 would be located within conductor stringing sites or conductor field snub areas.
2 128.6~~152~~ acres of material yards located on undisturbed areas; remainder of material yard acreage (116.2~~144.8~~ acres) is previously disturbed.
3 0.4 acres of helicopter landing zones overlap with access roads; these overlapping areas would not be restored, but area is included in Existing Access and Spur Roads row.
4 Total Acres Disturbed During Construction reflects the sum of the disturbance areas with overlaps between and among structure installation, removal, and modification work areas, conductor stringing sites, conductor field snub or splice areas, splice removal areas, guard structure installation and removal areas, telecommunications pull and tension sites, material yards, helicopter landing zones, and access roads removed; therefore, columns do not sum.
5 Total Acres Newly and Permanently Disturbed calculated as follows: Total Acres Disturbed During Construction (2,285~~731~~) <minus> Acres to be Restored (129~~155.9~~ acres) <minus> Area of Currently-Disturbed Access Roads (547~~683.5~~ acres).

Ground Disturbance for Access and Spur Road Construction

Table B-8, Ground Disturbance for Access and Spur Roads, shows the potential land disturbance for access roads and spur roads to be used during construction.

Table Error! No text of specified style in document.**8. Ground Disturbance for Access and Spur Roads**

Project Feature	Quantity	Disturbance Estimate (L x W)	Acres Disturbed During Construction	Acres to be Restored	Acres Permanently Disturbed
Existing Access and Spur Roads	~~386.2~~305.9 miles	# of miles x 18 feet	~~845.5~~672.5	0	123.9~~162~~[1]
New Spur Roads	~~2.8~~2.7 miles	# of miles x variable dimensions	~~4.8~~5.8	0	~~4.8~~5.8
Access and Spur Road Total			**~~850.3~~678.3**	**0**	**~~166.8~~129.7**

Source: SCE, PEA Table 3.7-3. Updated with PEA Deficiency Data Request - 007, Response Date: 4/13/2021.
1 The width of existing access and spur roads varies across the I-C Project alignment. SCE's standard design for access and spur roads is that they have a width of 18 feet (a 14-foot drivable surface and 2-foot shoulders on each side of the road). At present, existing access and spur roads account for ~~687~~ 549 acres of disturbance. To bring these access and spur roads up to the SCE standard design, an additional ~~162~~ 124 acres would be permanently disturbed. No disturbance outside the 18-foot width (including vegetation trimming) is included in these calculations.

Excavation Material

As described in Table B-2, an estimated total of ~~1,698~~1,618 poles or towers will be removed as part of the Proposed Project. The amount of soil estimated to be generated from the excavation of each new or replacement pole or tower is expected to range from approximately 6 to 71 cubic yards depending on the required dimensions for each excavation.

Formatted: Highlight

…

Approximately 35 vaults or pull boxes would be installed under the Proposed Project at or in the vicinity of the existing substations, resulting in the excavation of approximately 375 cubic yards of soil material. An additional approximately 400 cubic yards of soil may be excavated for installation of underground fiber optic cable at or in the vicinity of the existing substations. ~~In addition, it is anticipated that between 590 and 1,180 cubic yards of material would be excavated to facilitate each jack-and-bore installation required for the Proposed Project.~~

Construction Equipment and Workforce

Table B-10, Construction Equipment Estimate, lists the equipment SCE expects to use during construction and the estimated duration of use for each piece of equipment.

Commented [SG2]: Foot note #2 missing in table and

2 Includes removal of existing H-frames and temporary multipole LWS structures.
3 Includes permanent and temporarily-installed LWS poles.
4 Includes permanent and temporarily-installed LWS H-frames and permanent and temporarily-installed multipole LWS structures.

Proposed Construction Timing

SCE anticipates that construction of the Proposed Project would take approximately 36 months. Construction would commence following CPUC approval, final engineering, procurement activities, land rights acquisition, and receipt of all applicable permits. Table B-12, Proposed Construction Schedule, shows the proposed schedule for project activity.

Table Error! No text of specified style in document.**-12. Proposed Construction Schedule**

Project Activity	Approximate Duration (months)	Approximate Start Date
PTC Application Submitted	---	July 2019
Amended PTC Application	22	April 2020
Second Amended PTC Application	---	October 2024
Acquisition of Required Permits	16	~~August 2025~~October 2025

Data Request 16, Attachment 2: Deteriorated Pole Program Data

Please update the following as requested in the DR 16 cover letter.

Deteriorated Pole Program (from ADEIR Draft Project Description, moved to Cumulative)

The Deteriorated Pole Program (DPP) is an on-going SCE system-wide program created over a decade ago to address the inspection and maintenance requirements of CPUC's General Order 165 and General Order 95. The Transmission Line Rating Remediation (TLRR) and DPP are independent programs.

Reconductoring of 42 miles within Segment 1 was scheduled for 2019-2020 but did not occur as planned. SCE states that there is continual review of SCE facilities within High Fire Risk Area (HFRA) and reconductor work for Segment 1 is not currently expected to occur prior to the start of this Proposed Project. Regardless of whether reconductoring within HFRA occurs before construction of the Proposed Project, the Proposed Project will include rebuilding and reconductoring of Segment 1 to remediate discrepancies along the Control-Haiwee-Inyokern and Control-Coso-Haiwee-Inyokern 115kV subtransmission lines.

SCE has been implementing the DPP pole replacements prior to implementation of the I-C Project and reconductoring of the I-C line segments. Poles replaced in Segments 1 and 2 require replacement as part of the Proposed Project; however, poles replaced in Segments 3N and 3S are not anticipated to require further replacement. [1]

A total of 464 poles have been replaced under the DPP since 2020, and an additional 76 poles are scheduled for replacement under this program through 2025. Table E-1 (Deteriorated Pole Program Pole Replacements) summarizes the poles replaced and planned for replacement under the DPP for each segment. [2]

Table E-1. Deteriorated Pole Program – Poles Installed by Year

Subject:

FAA Filing Determination:
TLRR Subtransmission Line Project: Ivanpah-Control (IC)
IC Segments 1, 2, 3, and 4

EXECUTIVE SUMMARY

Arcadis reviewed the proposed engineering designs for the Ivanpah-Control Line (IC), Segments 1, 2, 3, and 4 (formerly known as CH and ICKI) subtransmission line project to determine which structures and conductor spans (catenaries) will require filing with the FAA for obstruction evaluations. For the purposes of the FAA filing requirements, there are two basic areas: “Within the Airport Vicinity” (those structures and catenaries within 20,000 feet from the edge of a runway) and “Outside the Airport Vicinity’ (those structures and catenaries beyond 20,000 feet from the edge of a runway).

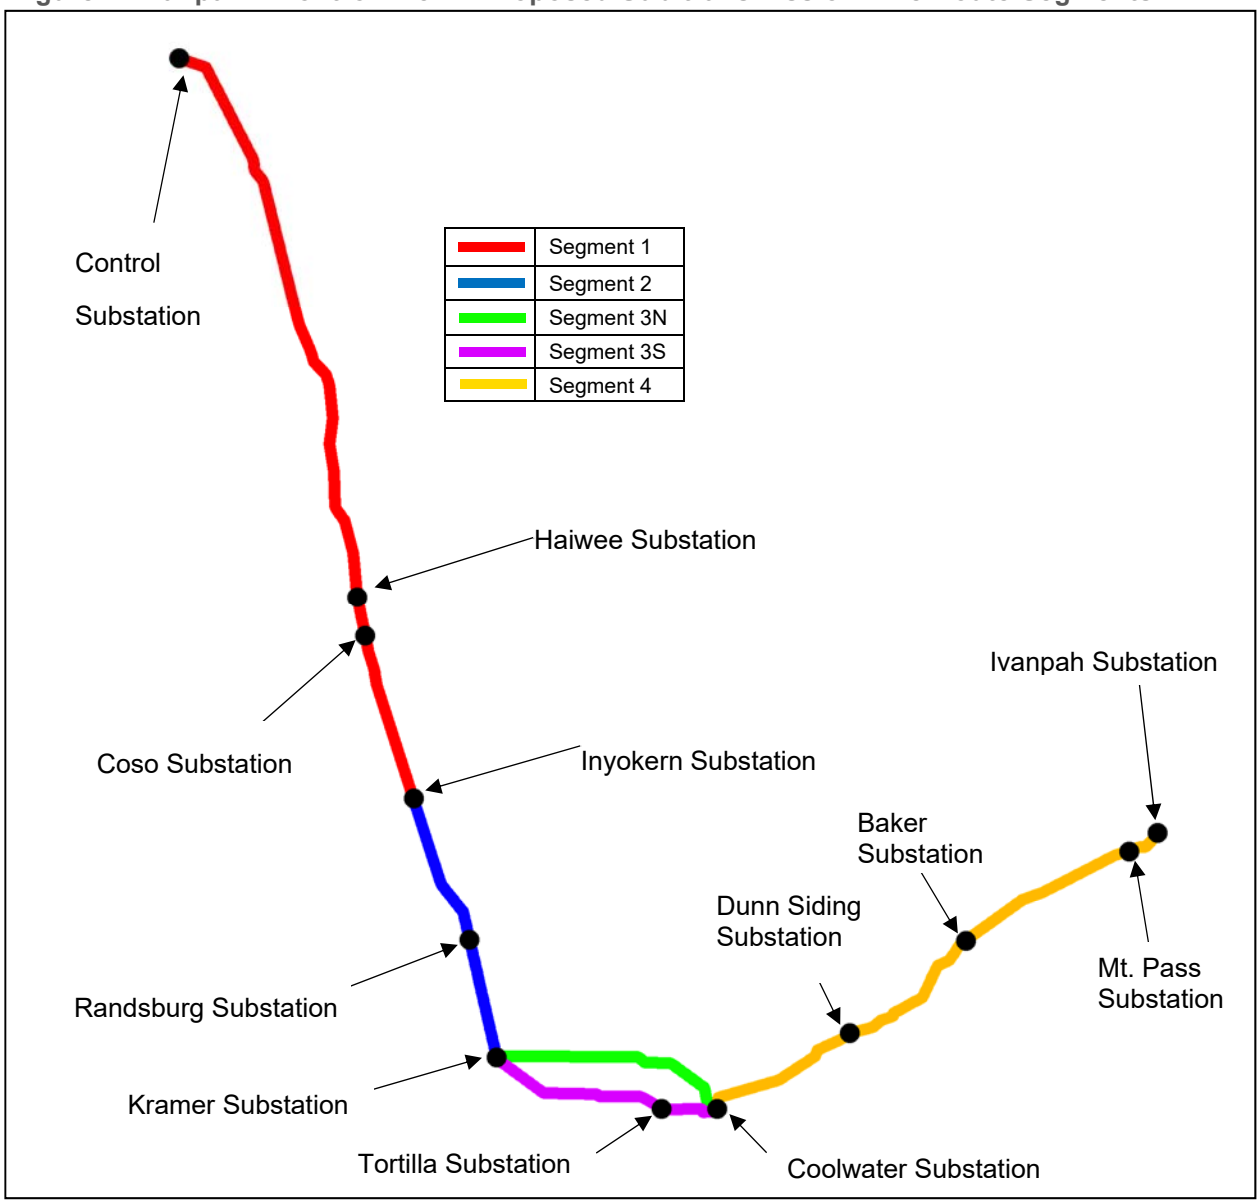
For the Ivanpah-Control line, Segments 1, 2, 3, and 4, there is one span outside the airport vicinity that will require FAA filing based on a catenary height greater than 200 feet. There are no structures outside the airport vicinity that are over 200 feet in height, that would prompt a FAA filing.

A total of 276 proposed structures along the IC Segments 1, 2, 3, and 4 subtransmission line project fall within the airport vicinities. Using the slope methodology as detailed below, 56 of these structures will require FAA filing to determine if they are obstructions to air navigation. Whenever a structure requires filing within the airport vicinity, the adjacent lines would also require filing.

GEOGRAPHIC SEGMENTS

The construction activities proposed by the IC transmission line rating remediation project design are described in detail for each geographic segment, including the planned structure and conductor removals and installations and approximate line lengths values. For visual reference Figure 1 depicts the location of each segment along the project alignment.

Figure 1: Ivanpah – Control 115 kV Proposed Sub-transmission Line Route Segments



The project has been divided into the following phase arrangement segments in the PEA report submittal. The sections are further subdivisions of the lines based on the line design and phasing.

REGULATORY FRAMEWORK

Title 14 Code of Federal Regulations (CFR) Part 77, Safe, Efficient Use, and Preservation of the Navigable Airspace, Section 9, Construction or alteration requiring notice, requires that any type of construction or alteration of a structure that may affect the National Airspace System (NAS) must be noticed to the Federal Aviation Administration (FAA) by completing the Notice of Proposed Construction or Alteration form (FAA Form 7460-1). Section 9 also details the dimensions and locations of structures that require filing. Federal Aviation Administration Advisory Circular 70/7460-1L sets forth standards for marking and lighting obstructions that have been deemed to be a hazard to navigable airspace.

FILING ANALYSIS METHODLOGY

Arcadis performed a GIS-based analysis of each of the proposed structures and catenaries included in the IC Segments 1, 2, 3, and 4 subtransmission line project. Each structure and catenary were evaluated using the criteria in 14 CFR 77.9 to determine if the structure or catenary:

(a) Outside the Airport Vicinity: Is more than 200 feet above ground level (AGL) and beyond 20,000 feet from an airport runway at its location.

--or--

(b) Within the Airport Vicinity: Exceeds an imaginary surface extending outward and upward at any of the following slopes:

(1) 100 to 1 for a horizontal distance of 20,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway more than 3,200 feet in actual length, excluding heliports.

(2) 50 to 1 for a horizontal distance of 10,000 feet from the nearest point of the nearest runway of each airport described in paragraph (d) of this section with its longest runway no more than 3,200 feet in actual length, excluding heliports.

(3) 25 to 1 for a horizontal distance of 5,000 feet from the nearest point of the nearest landing and takeoff area of each heliport described in paragraph (d) of this section.

The airports and runways shown in Table 1 were identified from FAA data to be in the vicinity of the Ivanpah-Control project. The horizontal plane distances used in the analysis and shown in Table 1 are based on the runway lengths.

Table 1: Airports and Horizontal Distances

Airport	Horizontal Distance (feet)	Associated Projects
Independence Airport	20,000 (1 runway) 10,000 (1 runway)	Ivanpah-Control: IC Segment 1
Lone Pine/Death Valley Airport	20,000 (1 runway) 10,000 (1 runway)	Ivanpah-Control: IC Segment 1
Inyokern Airport	20,000 (3 runways)	Ivanpah-Control: IC Segments 1 and 2

Airport	Horizontal Distance (feet)	Associated Projects
Barstow-Daggett Airport	20,000 (2 runways)	Ivanpah-Control: IC Segments 3N, 3S, and 4
Baker Airport	10,000	Ivanpah-Control: IC Segment 4

Proposed structures located within the prescribed horizontal distance and slope ratio for each runway were identified. Each of these locations was analyzed using the runway elevation, base structure elevation, distance from the runway edge to the proposed structure, and slope ratio to determine if the structure height exceeds the imaginary surface.

RESULTS & ANALYSIS OF STRUCTURES AND CATENARIES

Ivanpah-Control: Segments 1, 2, 3, and 4 Projects

One span in IC Segment 4 is outside of the airport vicinities and requires filing per 14 CFR 77 as shown in Table 2 below.

Table 2: Ivanpah-Control Segment 4 Project

Span from Structure	Span to Structure	Latitude (Deg-Min-Sec)	Longitude (Deg-Min-Sec)
1281181	1281182	35° 30' 19.882" N	115° 32' 24.539" W

There are no structures above 200 feet in height on the Ivanpah-Control: Segments 1, 2, 3, and 4 lines. Therefore, only those structures within the airport vicinities need analysis.

Table 3 presents a summary of the number of proposed structures that are within the maximum prescribed horizontal distance from the identified airport runways. Those that break the slope line and will thus need to be filed with the FAA are quantified. Whenever a structure requires filing within the airport vicinity, the adjacent lines (spans) would also require filing. These structures and spans are listed in the table in Attachment A and shown on the figures in Attachment B.

Table 3: Structures Requiring Filing

Projects	Total Proposed Structures Within Specified Horizontal Distance	Total Proposed Structures Exceeding Horizontal Plan Slope and Requiring Filing
Ivanpah-Control Line: Segment 1	150	21
Ivanpah-Control Line: Segments 2, 3, and 4	126	35

Table 4: Location of Structures and Spans Requiring FAA Filing

ATTACHMENT A: MAPS OF SPANS AND STRUCTURES REQUIRING FAA FILING

IVANPAH-CONTROL: SEGMENTS 1, 2, 3, AND 4 PROJECTS

IC SEGMENT	LOCATION
1	Independence Airport
1	Lone Pine/Death Valley Airport
1 and 2	Inyokern Airport
3N, 3S, and 4	Barstow-Daggett Airport
4	Baker Airport
4	Single Span Greater Than 200 Feet

Structures shown in blue were analyzed, but do not require filing. Structures shown in red were analyzed and require filing.
