## **SECTION 1.0 – INTRODUCTION**

### **1.1. PROJECT DESCRIPTION**

The Cleveland National Forest (CNF) is requesting an Environmental Impact Statement (EIS) be prepared for the issuance of a Master Special Use Permit to the San Diego Gas and Electric Company (SDG&E). The Master Special Use Permit would cover the operations and maintenance of the existing electric distribution and transmission lines, appropriate access roads, and facilities within the Trabuco, Palomar, and Descanso ranger districts of the CNF. The existing facilities are needed to supply power to local communities, residents, and government-owned facilities located within and adjacent to the CNF. The CNF is also analyzing operational and equipment upgrades and improvements to the existing lines. The Master Special Use Permit would also include conditions necessary for resource protection. Chambers Group has conducted biological surveys, including focused sensitive wildlife species surveys and focused surveys for rare plants, along the distribution and transmission line right-of-ways (ROWs) within the CNF and surrounding areas (Project Area). The objective of this study was to determine the presence or absence of 39 targeted sensitive plant species as requested by the United States Forest Service (USFS) within the proposed Project Area. For purposes of this report, species are considered to be sensitive if, in accordance with the final Project EIS, they are a federal- or state-listed as threatened or endangered species or they are listed by the CNPS as a sensitive species with a limited distribution. Five categories of plants are considered sensitive by the CNPS. These include:

- List 1A – Plants presumed extinct in California;
- List 1B – Plants rare and endangered in California and throughout their range;
- List 2 – Plants rare, threatened, or endangered in California but more common elsewhere in their range;
- List 3 – Plants about which we need more information; a review list; and
- List 4 – Plants of limited distribution; a watch list.

### **1.2. PROJECT AREA**

The Project Area includes approximately 167 linear miles of 12 transmission and distribution lines and includes the associated access roads and work areas. The Project Area extends into 14 United States Geological Survey (USGS) 7.5-minute quadrangles that include Warner Ranch, Palomar Observatory, Pala, Santa Ysabel, Ramona, Cuyamaca Peak, Descanso, Mount Laguna, Cameron Corners, Live Oak Springs, Morena Reservoir, Barrett Lake, Vejas Mountain, and Julian. The area surveyed ranged from the unincorporated area of Warner Springs in north San Diego County to the unincorporated community of Lake Morena Village at the south end of the county. The survey areas within the Cleveland National Forest crossed through multiple ranger districts including the Descanso and Palomar Ranger Districts. Survey areas were not restricted to Cleveland National Forest lands. Survey areas also intersected lands belonging to private citizens, the Bureau of Land Management (BLM), the Vista Irrigation District, the La Jolla Band of Luiseño Indians, and the Campo Kumeyaay Nation.

The area surveyed consisted of a 150-foot buffer around each transmission/distribution pole centerline which was extended to a 250-foot radius around each pole where the overhead line makes an angle

greater than 2 degrees. The additional buffer is to include potential additional work space that is typically required during operation and maintenance work at angle points within the overhead lines. Individual circuit and TL segments are identified by geographical locations within San Diego County and are referenced by the associated transmission/distribution line (tie-line, TL). One master mapbook was created for all areas that required surveying (Survey Area) and can be found in Appendix A.

### **1.3. AREA DIVISIONS**

The following six TLs and six circuits are located primarily in the CNF and traverse the Viejas, La Posta, Campo, Manzanita, La Jolla, and Rincon tribal reservations as well as the City of San Diego reservoir facilities of Lake Morena and Barrett Lake, the unincorporated community boundaries of Alpine, Descanso, Potrero, Campo, Warner Springs, Pauma Valley, Santa Ysabel, Julian, Cameron Corners, Ramona, San Diego Country Estates, Cuyamaca, and Laguna Mountain. TLs and circuits are outlined per the SDG&E naming convention of TL and circuits in this report.

- TL 682 begins at the Warner Substation in the unincorporated area of Warner Springs, California, and continues west to the Rincon Substation crossing the La Jolla and Rincon reservations.
- TL 637 begins in the unincorporated community of Santa Ysabel and continues southwest to the unincorporated communities of San Diego Country Estates and Ramona and terminates at the Creelman Substation.
- TL 626 begins in the unincorporated community of Santa Ysabel at the Santa Ysabel Substation, continues south to the unincorporated community of Descanso, and terminates at the Descanso Substation.
- TL 629 begins in the unincorporated community of Descanso at the Descanso Substation, continues east and then south to Pine Valley, again continuing east and south to the La Posta and Manzanita reservations, and terminates at the Golden Acorn Substation near the unincorporated community of Live Oak Springs.
- TL 625 begins at the Loveland Substation in the unincorporated community of Alpine, continues east to Japatul Valley, and terminates at the Descanso Substation in the unincorporated community of Descanso.
- TL 6923 begins in the unincorporated community of Cameron Corners, continues west and south to the unincorporated community of Potrero, and terminates at Barrett Substation.
- Circuit 78 (Viejas Grade Area) begins in the unincorporated community of Descanso and continues west to the Viejas Reservation along Viejas Grade, a county road.
- Circuit 157 (Barrett Lake Area) begins south of the unincorporated community of Japatul Valley, crosses the City of San Diego lands around Barrett Lake, and terminates at a private residence.
- Circuit 449 (Morena Reservoir Area) begins in the unincorporated community of Lake Morena Village, services the community of Lake Morena Village, and continues north to Buckman Springs.

- Circuit 440 (Laguna Mountains Area) begins in the unincorporated community of Buckman Springs at the Buckman Springs Substation and continues along Sunrise Highway to Mount Laguna peak, terminating at the unincorporated community of Mount Laguna.
- Circuit 79 (Cuyamaca Area) begins in the unincorporated community of Cuyamaca, crosses California State Route 79, and terminates in the Cuyamaca Peak area.
- Circuit 442 (Corte Madera Area) begins in the unincorporated community of Pine Valley at the Pine Valley Substation south of the Interstate 8 freeway, continues south through parts of the Corte Madera Ranch area, and terminates at a Forest Service Fire Lookout Tower.

## SECTION 2.0 – EXISTING CONDITIONS

### 2.1. ECOSYSTEMS

The various TLs within the Survey Area pass through several ecosystems or eco-regions, including southern mountains, southern foothills, central foothills, and the central valley regions of San Diego County. The following general descriptions pertain to those communities encountered within the Survey Area during the focused rare plant survey.

#### 2.1.1 Forests and Woodlands

Forest and woodland habitats consist of multilayered vegetation. Forest habitats typically are characterized as having closed, dense tree canopies. Woodland habitats usually have a more open (20 percent) canopy than forest habitats (Gray and Bramlet 1992).

##### **Mixed Oak Woodland**

This type of community typically varies from pure, closed canopies of more than one oak (*Quercus* sp.) species as the dominant species, to mixtures with conifer and broadleaf trees, to open savannas. Trees in this community are approximately 10 to 25 meters in height. The herbaceous layer can be continuous. Mixed Oak Woodland can be found in canyon bottoms and steep, north-facing slopes with various soil types. This type of community recovers from fires very rapidly.

##### **Montane Forests**

Montane Forests are typically dominated by various tall evergreen coniferous species such as pine (*Pinus* spp.), cypress (*Cupressus* spp.), fir (*Abies* spp.), and Douglas fir (*Pseudotsuga macrocarpa*). This community is typically found at higher elevations on steep slopes, growing above and often integrating with Oak Woodlands, Chaparrals, and Riparian Forests or can be found growing in lower tree or shrub layers of the canopy.

##### **Southern Riparian Forest**

This type of community is dominated by tall, open, broadleaved, winter-deciduous riparian species such as willow (*Salix* spp.), cottonwood (*Populus* spp.), sycamore (*Platanus racemosa*), and alder (*Alnus* spp.) species. The understory is usually dominated by shrubby willow species or other riparian shrubs. This community is almost always found along rivers and streams or in areas with a high water table. Dominant species require moist, bare mineral soil for germination and establishment and will typically begin to establish after flood waters recede.

##### **Oak Savanna**

This type of community consists of annual grasses or perennial needlegrass (*Nassella* spp.) species with widely scattered trees that consist of less than 10 to 20 percent of the canopy cover. The dominant oak species in this community, particularly in San Diego County, is mainly coast live oak (*Quercus agrifolia*). The Oak Savanna community usually integrates with Oak Woodlands (Gray and Bramlet 1992).

### **2.1.2 Scrublands and Chaparral**

Scrublands consist of drought-deciduous, low, soft-leaved shrubs and herbs which are often gray-green in color. They occupy gentle to steep slopes with shallow or heavy soils mostly at elevations below 3,000 feet above mean sea level (amsl). Chaparrals consist of evergreen, dark green leathery-leaved, medium to tall shrubs that are adapted to occasional fires (Gray and Bramlet 1992).

#### **Southern Mixed Chaparral**

Southern Mixed Chaparral communities are most often found at elevations below 3,000 feet. This type of community is dominated by broad, leathery-leaved, woody shrubs 1.5 to 3 meters in height, forming a dense vegetation canopy typically dominated by scrub oak (*Quercus berberidifolia*), chamise (*Adenostoma fasciculatum*), several manzanita (*Arctostaphylos* spp.) and ceanothus (*Ceanothus* spp.) species with patches of bare soil. Plants are deeply rooted with little to no understory but have an accumulation of leaf litter. Growth occurs throughout the year with the highest growth period during the spring. Growth is reduced during the late summer-fall dry season or during winter at higher elevations. Southern Mixed Chaparral is adapted to repeated fires through which many species respond by stump sprouting from an underground root burl. This community is typically found on dry, rocky, often steep slopes with little soil. This community can be found adjacent to Chamise Chaparral.

#### **Chamise Chaparral**

Chamise Chaparral communities are most often found at elevations ranging from 2,500 to 3,500 feet. This type of community is a chaparral dominated by chamise ranging from 1 to 3 meters in height. Other species common within this community contribute little to no vegetative cover. Very mature stands have little to no understory. Chamise Chaparral is fire-adapted through stump sprouting. Soils are shallow and dry, often on xeric slopes and ridges (Holland 1986).

#### **Diegan Coastal Sage Scrub**

Diegan Coastal Sage Scrub communities are most often found at elevations below 1,500 feet. This community is the most common form of Coastal Sage Scrub found in San Diego County. This community is made up of low, soft-woody subshrubs up to 1 meter in height that are most active in winter and early spring. Most species commonly found in the community are drought deciduous and include species such as California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), white sage (*Salvia apiana*), and laurel sumac (*Malosma laurina*). This community can be found on steep, xeric slopes or clay-rich soils that release stored water slowly. Diegan Coastal Sage Scrub may integrate with types of chaparral at higher elevations (Holland 1986).

#### **Semi-Desert Chaparral**

Semi-Desert Chaparral communities are most often found at elevations ranging from 2,000 to 5,000 feet. This type of community is similar to Southern Mixed Chaparral that is dominated by broad, leathery-leaved, woody shrubs 1.5 to 3 meters in height, but it forms more open vegetation canopies typically dominated by scrub oak, chamise, several manzanita species, and ceanothus species. Additional species of juniper (*Juniperus* spp.), buckwheat (*Eriogonum* spp.), and opuntia (*Opuntia* spp.) may also play an important role a semi-desert chaparral. Winters in this community are colder and summers are

hotter than Southern Mixed Chaparral. This community is also less fire-prone because of lower fuel loads.

### **2.1.3 Grasslands and Meadows**

Grasslands consist of low, herbaceous vegetation dominated by grasses. These habitats grow in deep, well-developed soils on gentle slopes and flats. Meadow habitats are often referred to as seasonal wetlands that consist of seasonally-flooded or saturated areas dominated by annual and perennial herbs (Gray and Bramlet 1992).

#### **Montane Wet Meadow**

Montane Wet Meadows are most often found at elevations ranging from 5,000 to 9,000 feet. This type of community is dominated by a dense growth of sedges (*Carex* spp.) and other perennial herbs, usually from 0.5 to 1 meter in height. Often, taller herbs up to 2 meters in height will also be characteristic of a Montane Wet Meadow. The main growth at high elevations is during the summer months. Montane Wet Meadows are dormant in the winter. Soils in this community are saturated throughout the year (Holland 1986).

#### **Freshwater Seep**

Freshwater Seeps in San Diego County are most often found at elevations ranging from 2,000 to 4,000 feet. This type of community is composed of mostly perennial herbs, typically sedges and grasses, often forming complete vegetative cover that grows throughout the year. Soils are permanently moist. Freshwater Seeps were often found on pasturelands on private property within the Survey Area.

#### **Native Grasslands**

Native Grasslands can occur at a variety of elevations, typically less than 6,000 feet. This type of community is typically dominated by native perennial bunchgrasses such as needlegrass species. Native and introduced annual species often grow between the perennial species and can exceed the bunchgrasses in vegetative cover. Soils are fine-textured, often clay soils that become highly saturated in the winter and very dry in the summer. This community is known to integrate with Oak Woodlands (Holland 1986).

### **2.1.4 Other Areas**

Areas that are not considered native, naturally-occurring habitats are categorized as “Other Areas” for their lack of dominant native vegetation or because they have been dramatically disturbed or altered by humans.

#### **Non-Native Grassland**

Non-Native Grasslands are most often found at elevations below 3,000 feet. This type of community consists of a dense to sparse cover of annual grasses such as oats (*Avena* sp.), bromes (*Bromus* sp.), and ryegrass (*Lolium* sp.) with flowering culms up to 3 feet in height. This community is often associated with numerous species of showy-flowered, native annual forbs, “wildflowers,” such as California poppy (*Eschscholzia californica*), lupines (*Lupinus* sp.), and goldfields (*Lasthenia* sp.) especially in years of

favorable rainfall (Holland 1986). Germination occurs with the onset of the late fall rains; growth, flowering, and seed-set occur from winter through spring. Typically plants are dead through the summer-fall dry season, persisting as seeds. Non-Native Grassland can be found on fine-textured, usually clay soils, that are moist or even waterlogged during the winter rainy season and very dry during the summer and fall. Approximately 576 acres of this community exist within the Survey Areas.

### **Pasturelands**

This type of community is best characterized as Dryland Field Crops as described in Gray and Bramlet (1992), consisting of planted, annual grasses and forbs harvested for livestock feed. These species include barley (*Hordeum* spp.), wild oat (*Avena* spp.), and clover or alfalfa (*Trifolium* spp., *Medicago sativa*) species. Soils are similar to native grasslands, made up of fine-textured, often clay soils that can be very moist in the winter and very dry in the summer.

### **Urban and Developed**

Urban and Developed areas consist of buildings, pavement, and highway ROWs throughout incorporated portions of the county (Gray and Bramlet 1992).

### **Disturbed**

Disturbed, often barren, areas either lack vegetation because of clearing or grading or are dominated by ruderal pioneering herbaceous species that readily colonize disturbed ground, such as tocalote (*Centaurea melitensis*), wild oat (*Avena fatua*), black mustard (*Brassica nigra*), prickly sow-thistle (*Sonchus asper*), and wild lettuce (*Lactuca serriola*) (Gray and Bramlet 1992).

## **2.2. TOPOGRAPHY**

Topography along the various TLs within the Project Area varies from relatively flat pasturelands to steep, rocky cliffs in higher elevation mountain areas. The majority of the areas surveyed were characterized by rolling foothills and canyons.

## SECTION 3.0 – SURVEY METHODOLOGY

### 3.1. GENERAL SURVEY METHODOLOGY

Suitable environmental conditions exist for multiple sensitive plant species to occur within the Survey Area. Through coordination with the CNF, a list of 39 target species with a potential to occur onsite was compiled and a series of focused rare plant surveys were conducted. Focused rare plant surveys were conducted during three separate survey periods (spring, summer, and fall of 2010) within the Project ROW to capture the blooming periods for each of the 39 targeted species. The spring survey took place between April 20 and June 4, 2010. The summer survey occurred between June 7 and June 30, 2010. The fall survey took place between August 2 and September 15, 2010. Focused rare plant surveys for the targeted species were performed in accordance with survey protocols set forth by the California Department of Fish and Game (CDFG), the California Native Plant Society (CNPS 2001), and United States Fish and Wildlife Service (USFWS 2000) Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants. Those sensitive plant species with a potential for occurrence onsite that were targeted during the surveys include:

- sand verbena (*Abronia villosa* var. *aurita*);
- San Diego thornmint (*Acanthomintha ilicifolia*);
- Dean’s milkvetch (*Astragalus deanei*);
- Jacumba milkvetch (*Astragalus douglasii* var. *perstrictus*);
- San Diego milkvetch (*Astragalus oocarpus*);
- Orcutt’s brodiaea (*Brodiaea orcuttii*);
- Dunn’s mariposa lily (*Calochortus dunnii*);
- San Bernardino Mountains owl’s clover (*Castilleja lasiorhyncha*);
- Payson’s jewelflower (*Caulanthus simulans*);
- Lakeside ceanothus (*Ceanothus cyaneus*);
- Parry’s spineflower (*Chorizanthe parryi* var. *parryi*);
- long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*);
- delicate clarkia (*Clarkia delicata*);
- Cuyamaca cypress (*Cupressus arizonica* ssp. *arizonica*);
- Tecate cypress (*Cupressus forbesii*);
- Tecate tarplant (*Deinandra floribunda*);
- Cuyamaca larkspur (*Delphinium hesperium* ssp. *cuyamaca*);
- vanishing wild buckwheat (*Eriogonum evanidum*);
- Mission Canyon bluecup (*Githopsis diffusa* ssp. *filicaulis*);
- Ramona horkelia (*Horkelia truncata*);
- Warner Springs lessingia (*Lessingia glandulifera* var. *tomentosa*);
- lemon lily (*Lilium parryi*);
- Parish’s meadowfoam (*Limnanthes gracilis* var. *parishii*);
- Orcutt’s linanthus (*Linanthus orcuttii*);
- Mount Laguna aster (*Machaeranthera asteroides* var. *lagunensis*);
- felt-leaved monardella (*Monardella hypoleuca* var. *lanata*);
- Baja navarretia (*Navarretia peninsularis*);
- peninsular nolina (*Nolina cismontana*);
- Gander’s butterweed (*Packera* [*Senecio*] *ganderi*);
- San Bernardino bluegrass (*Poa atropurpurea*);
- Moreno currant (*Ribes canthariforme*);

- San Miguel savory (*Satureja chandleri*);
- southern skullcap (*Scutellaria bolanderi* ssp. *austromontana*);
- Hammitt’s claycress (*Sibaropsis hammittii*);
- Laguna Mountain jewelflower (*Streptanthus bernardinis*);
- southern jewelflower (*Streptanthus campestris*);
- San Bernardino aster (*Symphotrichum defoliatum*);
- Parry’s tetraococcus (*Tetraococcus dioicus*); and
- velvety false-lupine (*Thermopsis californica* var. *semota*).

Species identified as being sensitive and having the potential to occur along the survey routes were reviewed by Chambers Group botanists prior to starting surveys each day. Botanists walked within the ROW approximately 30 feet (9 m) apart and visually surveyed for any signs of the targeted plant species. A complete inventory of all plant species observed within the Survey Area was prepared (Appendix B). Sensitive plant species observed during the survey were documented by counting individuals or estimating numbers for larger populations, characterizing the approximate population size, and recording a Global Positioning System (GPS) location. Representative photographs were taken (Appendix C) of each rare plant species identified within the Survey Area. Species that had the potential to occur in San Diego County and that were identified as one of the 39 targeted CNF sensitive species were given priority. Subsequent species were identified in the field by Chambers Group botanists. As a result, the information provided for these subsequent species is not a comprehensive representation of their populations along the ROW.

Surveys were conducted by four teams per day, with each team consisting of an average of four botanists. Each team was comprised of a technical lead and a team lead. The technical leads were considered expert botanists with many years of plant identification and taxonomy experience as well as specialized knowledge of San Diego flora. The team leads were responsible for maintaining consistency among teams and ensuring each team member within each group was walking appropriate distances between adjacent team members and at a pace suitable for thorough investigation. The team lead was also responsible for relaying safety procedures and reporting location information back to the Project Manager. Thirty-four Chambers Group botanists participated in the surveys, with between 8 and 18 people surveying on any given day (Table 1).

Additional information, such as soil type, slope, aspect, elevation, and associated plant species were recorded where relevant. All plant species encountered during the survey effort were recorded on standardized data sheets and will be provided upon request.

### 3.2. REFERENCE SITES

Prior to the surveys, lead Chambers Group botanists in each survey team visited reference sites and herbaria to develop visual search images and familiarize themselves with key differences that separate the targeted species from other species. Lead botanists examined specimens at the San Diego State University (SDSU) herbarium and the San Diego Natural History Museum herbarium collections.

Known reference sites in San Diego County also were visited during appropriate blooming periods when each of the targeted species was identifiable and distinguishing characteristics for each species were evident. Reference site locations were attained from USFS recognized sites, San Diego County herbaria accession records, known populations identified by Chambers Group, listings on Craig H. Reiser's Rare Plants of San Diego County website (Reiser 1994), and recorded populations documented by the California Natural Diversity Database (CDFG 2010) that have been observed within the last three years. Additional reference populations were identified by experienced technical leads for the Project, and entire teams of surveyors visited the sites prior to surveying within the Survey Area, if feasible. Botanists took site photos and small samples of species for identification where appropriate. Samples from particularly difficult species to identify were collected by permitted botanists and taken to experts at the San Diego Natural History Museum herbarium for positive identification.

### 3.3. SURVEY LIMITATIONS

#### 3.3.1 Access

Access to the ROW of TLs and circuits was limited due to dense vegetation, land management issues, locked gates, private property, sensitive utility customers, unimproved access roads, and routine Forest Service maintenance work. Portions of TLs and circuits were not surveyed for the presence or absence of

sensitive plant species due to these limitations. These limitations pertain to: TL 682, TL 637, TL 6926 (626), TL 629, TL 625, TL 6923, Circuit 78 (Viejas Grade Area), Circuit 79 (Cuyamaca Area), Circuit 157 (Barrett Lake Area), Circuit 440 (Laguna Mountains Area), Circuit 442 (Corte Madera Area), and Circuit 449 (Morena Reservoir Area).

**Sections with Limited Access**

Survey limitations occurred on segments of TLs and circuits designated as private property, separated by posted fences with distinguishable signage stating access restricted. Accesses to these specific locations were not allowed unless expressed permission was granted and documented. Additional survey limitations occurred due to steep, mountainous terrain within the Survey Area. Topography and environmental factors also limited access to survey routes. Botanists encountered creeks, gullies, lakes, streams, and washes along the survey routes. These areas imposed limited access due to erosion, road wash-outs, and unstable cliffs.

Limitations were also noted in which access roads were not surveyed due to dense chaparral vegetation exceeding 80 percent cover. Vehicle access to these sites was severely limited. Botanists surveyed along all proposed access roads within the Survey Area where feasible. Unless prior notice was given to residents, private roads were not surveyed. A detailed list of locations not included in the survey, is included below (Table 2).

### Weather Conditions

Plant population densities are highly dependent on weather patterns. Increased precipitation most often leads to higher densities of plants within a given population but can also expand the range of a population into areas that may normally be too dry. Precipitation in 2010 was above the annual average for San Diego County (Table 3). The increased precipitation did not halt the plant surveys or hinder access to TLs and circuits; however, the above-average precipitation for the year did prolong the survey periods.

The delayed rainy season and above-average rainfall extended the survey periods into September. Reference populations indicated the Warner Springs lessingia, the San Bernardino aster, and the Mount Laguna aster flowered later than originally predicted. The survey was divided into three rounds to maximize identification of sensitive species within the Survey Area. Chambers Group utilized known blooming periods (CNPS 2010) and adjusted those according to the blooming patterns of plants in reference populations adjacent to the Survey Area.

**Table 3  
Weather Conditions of San Diego County (April-September 2010)**

Month	Total Precipitation	Weather Conditions & Storm Events
April	1.74 inches	Rainfall
	11.00 inches	Snowfall occurred in eastern San Diego County at elevations above 2,500 feet
May	none	No storm events. Below average temperatures.
June	none	No storm events. Below average temperatures.
August	none	No storm events. Above average temperatures.
September	none	No storm events. Average temperatures.

**Abiotic Factors**

Additional abiotic factors may have played a significant role in the change in population size of rare plants and the locations where they were found. Species may have been impacted by factors such as: below average seasonal temperatures, recent and or past wildfires, an increase in soil salinity due to recent road grading, and soil erosion. These factors may have also affected surveys by disturbing the seed bank and impacting the abundance and flowering periods of rare plants.

## SECTION 4.0 – RESULTS AND DISCUSSION

The focused rare plant survey for the CNF sought to determine the presence or absence of 39 sensitive plant species from the Survey Area. The target list of rare plants included species that are federal- or state-listed as threatened or endangered or they are listed by the CNPS as a sensitive species with a limited distribution. Species encountered within the Survey Area were grouped into three categories: (1) targeted threatened and endangered species, (2) targeted non-threatened and endangered sensitive plant species, and (3) non-targeted sensitive plant species (CNPS-listed species). A detailed summary of focused rare plant survey species is provided in Section 3.1. A floristic list of all species encountered within the Survey Area was compiled (Appendix B). Photographs showing a representative specimen of the plant species at the time of the survey were taken (Appendix C). Location information detailing sensitive plant species populations was collected in the field and overlaid onto aerial photographs in GIS (Appendix D). As the current SDG&E alignment contains several potential routing alternatives, specific permanent and temporary impacts to rare plant species will depend on which routing alternatives are finalized.

Out of the 39 targeted species, 25 were observed and mapped within the ROW. Five of the targeted species observed are designated by the California State Endangered Species Act and CDFG as being sensitive. San Diego thornmint is federally-listed as threatened and state-listed as endangered. Parish's meadowfoam is state-listed as endangered. Gander's butterweed, Mount Laguna aster, and Dunn's mariposa lily are state-listed as rare. All five of these species were found during the survey. The remaining 34 targeted species are CNPS listed plants (List 1B, 2, 3, or 4) of which 20 taxa were observed. CNPS List 1B species are considered endangered throughout their range, CNPS List 2 species are considered endangered in California, but are more common elsewhere. Impacts to state and federal listed sensitive species and CNPS List 1B and 2 species, due to their high regional sensitivity, could potentially require mitigation.

During the surveys, 14 CNPS List 4 species (a watch list of species of limited distribution) were also observed during surveys and include some of the following: San Diego sunflower (*Bahiopsis laciniata*, formerly *Viguiera laciniata*), Payson's jewelflower, Peninsular spineflower (*Chorizanthe leptotheca*), Engelmann oak (*Quercus engelmannii*), Laguna Mountain jewelflower, and rush-like bristleweed (*Xanthisma junceum*, formerly *Machaeranthera juncea*). These CNPS List 4 species are of a lower sensitivity and do not require mitigation for the Project.

In addition, plant species known to be federal- or state-listed as threatened or endangered or identified as CNPS-listed species that were not identified by the CNF as targeted species were also identified and mapped. These additional non-targeted sensitive species total 18 different taxa and include one federal-listed as endangered species, Mexican flannelbush (*Fremontodendron mexicanum*).

The total number of individuals observed per taxon during the survey varied. In the targeted threatened and/or endangered group, more than 4,000 Parish's meadowfoam individuals were observed compared to numbers as few as 100 San Diego thornmint individuals. In the targeted non-threatened and/or endangered group, more than 15,000 long-spined spineflower plants and more than 11,000 delicate clarkia plants were mapped in several TLs and circuits, and as few as 2 Moreno currant individuals were mapped along only one circuit. Among the non-targeted sensitive species, as many as 607 desert beauty (*Linanthus bellus*) individuals were mapped compared with only one Mexican flannelbush shrub.

The numbers of individual sensitive plants observed and mapped along the ROW within the Survey Area are found in Table 4. A detailed summary of focused rare plant survey species is provided in Section 3.1.

#### **4.1. DESCRIPTIONS OF LISTED SENSITIVE SPECIES (TARGETED)**

##### **4.1.1 San Diego Thornmint (FT, SE, CNPS 1B.1)**

San Diego thornmint is an annual herb in the Lamiaceae family that flowers between April and June. This species favors clay soils and openings of chaparral, coastal scrub, valley and foothill grassland, and vernal pools. San Diego thornmint can be found at elevations between 30 and 3,150 feet (9 to 960 m) amsl. Approximately one-third of the historical occurrences in California have been extirpated; it is threatened by urbanization, road construction, vehicles, grazing, trampling, erosion, and non-native plants (CNPS 2010). A total of 100 individuals were observed within Circuit 78 of the Survey Area.

##### **4.1.2 Dunn's Mariposa Lily (Rare, CNPS List 1B.2)**

Dunn's mariposa lily is a bulbiferous herb in the Liliaceae family that flowers between April and June. This species often grows in the gabbro, metavolcanic, and rocky soils of closed-cone coniferous forests, chaparral, and valley and foothill grasslands. Dunn's mariposa lily can be found at elevations between 1,250 and 6,000 feet (381 to 1,828 m) amsl. This species is threatened by development, vehicles, and competition from non-native plants (CNPS 2010). A total of 1,438 individuals were observed within the Survey Area: 115 individuals were observed within Circuit 79, and 1,323 individuals were observed within TL 625.

##### **4.1.3 Cuyamaca Larkspur (Rare, CNPS List 1B.2)**

Cuyamaca larkspur is a perennial herb in the Ranunculaceae family that flowers between May and July. This species often grows in mesic soils of lower montane coniferous forest, meadows and seeps, and vernal pools. Cuyamaca larkspur can be found at high elevations between 4,000 and 5,350 feet (1,219 to 1,630 m) amsl. This species is threatened by development, grazing, and recreational activities (CNPS 2010). This species was not observed within the Survey Area.

##### **4.1.4 Parish's Meadowfoam (SE, CNPS List 1B.2)**

Parish's meadowfoam is an annual herb in the Limnanthaceae family that flowers between April and June. This species often grows in mesic soils in lower montane coniferous forest, meadows and seeps, and vernal pools. Parish's meadowfoam can be found at elevations between 2,000 and 6,600 feet (609 to 2,011 m) amsl. This species is threatened by altered hydrology, grazing, and recreational development (CNPS 2010). A total of 4,002 individuals were observed within Circuit 440 of the Survey Area.

##### **4.1.5 Mount Laguna Aster (Rare, CNPS List 2.1)**

Mount Laguna aster is a perennial herb in the Asteraceae family that flowers between July and August. This species often grows in cismontane woodland and lower montane coniferous forest. Mount Laguna aster can be found at elevations between 2,600 and 7,900 feet (792 to 2,507 m) amsl. This species is known in California from fewer than five occurrences and is threatened by development, grazing, and recreational activities, with a potential threat from road maintenance activities (CNPS 2010). A total of 413 individuals were observed within Circuit 440 of the Survey Area.

#### **4.1.6 Gander's Butterweed (Rare, CNPS List 1B.2)**

Gander's butterweed is a perennial herb in the Asteraceae family that flowers between April and June. This species often grows in gabbro soils of chaparral especially after a recent burn. Gander's butterweed can be found at elevations between 1,300 and 4,000 feet (396 to 1,219 m) amsl. This species is known from fewer than 20 occurrences and is threatened by recreational activities, vehicles and trampling (CNPS, 2010). A total of 444 individuals were observed within TL 625 of the Survey Area.

#### **4.1.7 San Bernardino Blue Grass (FE, CNPS 1B.2)**

San Bernardino blue grass is a perennial, rhizomatous herb in the Poaceae family that flowers between May and July and in rare instances as early as April and into August. This species often grows in mesic habitats such as meadows and seeps. San Bernardino blue grass can be found at elevations between 1,360 and 2,455 feet (414 to 748 m) amsl. Approximately 20 occurrences of San Bernardino blue grass has been observed in the San Bernardino Mountains and the Laguna Mountains (CNPS 2010). This species is threatened by development, grazing, hydrological alterations, mining, recreational activities, and vehicles, and potentially by hybridization with non-native Kentucky bluegrass (*Poa pratensis*) (CNPS 2010). San Bernardino blue grass was not observed within the Survey Area.

### **4.2. DESCRIPTIONS OF NON-LISTED SENSITIVE SPECIES (TARGETED)**

#### **4.2.1 Chaparral Sand-Verbena (CNPS List 1B.1)**

Chaparral sand-verbena is an annual herb in the Nyctaginaceae family that flowers between January and September. This species often grows in sandy soils of chaparral, coastal scrub, and desert dunes. Chaparral sand verbena can be found at elevations between 260 and 2,000 feet (79 to 609 m) amsl. This species is threatened by non-native plants, the alteration of fire regimes, road maintenance activities, flood control activities, vehicles, and development (CNPS 2010). Chaparral sand-verbena was not observed within the Survey Area.

#### **4.2.2 Dean's Milk-Vetch (CNPS List 1B.1)**

Dean's milk-vetch is a perennial herb in the Fabaceae family that flowers between February and May. This species often grows in chaparral, cismontane woodland, coastal scrub, and riparian forest. Dean's milk-vetch can be found at elevations between 250 and 2,200 feet (76 to 670 m) amsl. This species is known from fewer than 15 occurrences and from fewer than 10 locations in Diegan sage scrub, chaparral, and riparian communities, particularly southern oak woodlands (CNPS 2010). This species is seriously threatened by development, vegetation/fuel management activities, foot traffic, non-native plants, and road maintenance (CNPS 2010). A total of 54 individuals were observed within Circuit 157 and TL 6923 of the Survey Area.

#### **4.2.3 Jacumba Milk-Vetch (CNPS List 1B.2)**

Jacumba milk-vetch is a perennial herb in the Fabaceae family that flowers between April and June. This species often grows on rocky soils of chaparral, cismontane woodland, pinyon and juniper woodland, riparian scrub, and valley and foothill grassland. Jacumba milk-vetch can be found at elevations between 3,000 and 4,500 feet (914 to 1,371 m) amsl. This species is threatened by development and competition

from non-native plants (CNPS 2010). A total of 610 individuals were observed within Circuit 157, Circuit 449, and TL 629 of the Survey Area.

#### **4.2.4 San Diego Milk-Vetch (CNPS List 1B.2)**

San Diego milk-vetch is a perennial herb in the Fabaceae family that flowers between May and August. This species often grows in the openings among chaparral and cismontane woodland. San Diego milk-vetch can be found at elevations between 1,000 and 5,000 feet (304 to 1,524 m) amsl. This species is threatened by development, road maintenance, and recreation (CNPS 2010). A total of 105 individuals were observed within Circuit 157, Circuit 440, and TL 637 of the Survey Area.

#### **4.2.5 Orcutt's Brodiaea (CNPS List 1B.1)**

Orcutt's brodiaea is a perennial, bulbiferous herb in the Themidaceae family that flowers between May and July. This species often grows in the openings of chaparral, cismontane woodland, coastal scrub, playas, and valley and foothill grassland. This species favors a variety of soil types including; clay, mesic, and sometimes serpentine soils. Orcutt's brodiaea can be found at elevations between 100 and 5,550 feet (30 to 1,676 m) amsl. This species is seriously threatened by residential development, agriculture, foot traffic, grazing, illegal dumping, non-native plants, and vehicles. It is potentially threatened by road construction. It can hybridize with the state- and federal-listed endangered thread-leaved brodiaea (*Brodiaea filifolia*) (CNPS 2010). A total of 1,024 individuals were observed within TL 625 and TL 637 of the Survey Area.

#### **4.2.6 San Bernardino Mountains Owl's-Clover (CNPS List 1B.2)**

San Bernardino Mountains owl's-clover is a hemiparasitic annual herb in the Orobanchaceae family that flowers between May and August. This species often grows in mesic soils in chaparral, meadows and seeps, pebble plain, riparian woodland, and upper montane coniferous forest. San Bernardino Mountains owl's clover can be found at higher elevations between 4,300 and 7,800 feet (1,310 to 2,377 m) amsl. This species is threatened by development, mining, water diversions, grazing, fire suppression, vehicles, recreational activities, and competition from non-native plants (CNPS 2010). San Bernardino Mountains owl's clover was not observed on the Survey Area. This species has not been recorded in San Diego County (Rebman and Simpson 2006) and was not expected to occur within the Survey Area.

#### **4.2.7 Payson's Jewelflower (CNPS List 4.2)**

Payson's jewelflower is an annual herb in the Brassicaceae family that flowers between March and May and in some cases as early as February and as late as June. This species often grows in sandy and granitic soils in chaparral, coastal scrub. Payson's jewelflower can be found at elevations between 295 and 7,200 feet (89 to 2,194 m) amsl. Some populations of Payson's jewelflower are threatened by proposed reservoir construction. Many populations occur on public lands. This species is also threatened by urbanization, invasive species, grazing, and road construction (CNPS 2010). A total of 539 individuals were observed within TL 625 and TL 629 of the Survey Area.

#### **4.2.8 Lakeside Ceanothus (CNPS List 1B.2)**

Lakeside ceanothus is an evergreen shrub in the Rhamnaceae family that flowers between April and June. This species often grows in sandy or rocky openings of closed-cone coniferous forests and

chaparral habitats. Lakeside ceanothus can be found at elevations between 770 and 2,550 feet (235 to 777 m) amsl. This species is threatened by development (CNPS 2010). Lakeside ceanothus was not observed within the Survey Area.

#### **4.2.9 Parry's Spineflower (CNPS List 1B.1)**

Parry's spineflower is an annual herb in the Polygonaceae family that flowers between April and June. This species often grows in sandy or rocky openings of chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. Parry's spineflower can be found at elevations between 900 and 4,000 feet (274 to 1,219 m) amsl. This species is threatened by altered flood regime, development, mining, non-native plants, and vehicles (CNPS 2010). Parry's spineflower was not observed on the Survey Area. This species has not been recorded in San Diego County (Rebman and Simpson 2006) and was not expected to occur on the Survey Area. Parry's spineflower was not observed within the Survey Area.

#### **4.2.10 Long-Spined Spineflower (CNPS List 1B.2)**

Long-spined spineflower is an annual herb in the Polygonaceae family that flowers between April and July. This species often grows in clay soils of chaparral, coastal scrub, meadows and seeps, valley and foothill grassland, and vernal pools. Long-spined spineflower can be found at elevations between 100 and 5,020 feet (30 to 1,530 m) amsl. Much of its habitat has been lost to development. This species is threatened by competition from non-native grasses, recreational activities, vehicles and grazing (CNPS 2010). A total of 15,694 individuals were observed within Circuit 442, Circuit 449, TL 625, TL 629, and TL 682 of the Survey Area.

#### **4.2.11 Delicate Clarkia (CNPS List 1B.2)**

Delicate clarkia is an annual herb in the Onagraceae family that flowers between April and June. This species often grows in gabbroic soils in chaparral and cismontane woodland. Delicate clarkia can be found at elevations between 770 and 3,280 feet (234 to 999 m) amsl. This species is threatened by development, competition from non-native plants, frequent wildfires, road improvement and/or maintenance, and vehicles (CNPS 2010). A total of 11,978 individuals were observed in all of the Circuits and TLs except for Circuit 442, Circuit 79, and TL 629 of the Survey Area.

#### **4.2.12 Cuyamaca Cypress (CNPS List 1B.1)**

Cuyamaca cypress is a perennial evergreen tree in the Cupressaceae family. This species often grows in gabbroic soils in closed-cone coniferous forest, chaparral, cismontane woodland, and riparian forest. Cuyamaca cypress can be found at higher elevations between 3,400 and 5,600 feet (1,036 to 1,706 m) amsl. This species is threatened by alteration of fire regimes (specifically, frequent wildfires) and mining (CNPS 2010). Only one individual was observed within Circuit 440 of the Survey Area. This tree had mostly likely been planted for ornamental landscaping purposes.

#### **4.2.13 Tecate Cypress (CNPS List 1B.1)**

Tecate cypress is a perennial evergreen tree in the Cupressaceae family. This species often grows in clay, gabbroic, or metavolcanic soils in closed-cone coniferous forest and chaparral. Tecate cypress can be found at elevations between 840 and 4,900 feet (256 to 1,493 m) amsl. This species is threatened by alteration of fire regimes and mining and by development in both Orange and Riverside counties. In San

Diego County, Tecate cypress is protected in part at Otay Mountain (CNPS 2010). Only one individual was observed within Circuit 440 within the Survey Area. This tree had mostly likely been planted for ornamental landscaping purposes within the Al Bahr Mount Laguna Shrine Camp.

**4.2.14 Tecate Tarplant (CNPS 1B.2)**

Tecate tarplant is an annual herb in the Asteraceae family that flowers between August and October. This species often grows in chaparral and coastal scrub. Tecate tarplant can be found at elevations between 230 and 4,000 feet (70 to 1,219 m) amsl. This species is threatened by development and grazing (CNPS 2010). A total of 18,055 individuals were observed within TL 625, TL 626, and TL 6923 of the Survey Area.

**4.2.15 Vanishing Wild Buckwheat (CNPS 1B.1)**

Vanishing wild buckwheat is an annual herb in the Polygonaceae family that flowers between July and October. This species often grows in sandy soils of chaparral, cismontane woodland, lower montane coniferous forest, and pinyon and juniper woodland. Vanishing wild buckwheat can be found at higher elevations between 3,600 and 7,300 feet (1,097 to 2,225 m) amsl. This species is threatened by alteration of fire regimes, competition with non-native plants, development, foot traffic, grazing, recreational activities, and vehicles (CNPS 2010). A total of 1,533 individuals were observed within Circuit 440 and Circuit 449 of the Survey Area.

**4.2.16 Mission Canyon Bluecup (CNPS 3.1)**

Mission Canyon bluecup is an annual herb in the Campanulaceae family that flowers between April and June. This species often grows on mesic soils in chaparral and disturbed areas. Mission Canyon bluecup can be found at elevations between 1,476 and 2,300 feet (449 to 701 m) amsl. This species is known in California from fewer than five occurrences and is threatened by development (CNPS 2010). Mission Canyon bluecup was not observed within the Survey Area.

**4.2.17 Ramona Horkelia (CNPS 1B.3)**

Ramona horkelia is a perennial herb in the Rosaceae family that flowers between May and June. This species often grows in clay and gabbroic soils in chaparral and cismontane woodland. Ramona horkelia can be found at elevations between 1,312 and 4,265 feet (399 to 1,299 m) amsl. This species is threatened by recreational activities, chaparral management, mining, road maintenance, and grazing (CNPS 2010). A total of 97 individuals were observed within TL 626 of the Survey Area.

**4.2.18 Warner Springs Lessingia (CNPS 1B.3)**

Warner Springs lessingia is an annual herb in the Asteraceae family that flowers between August and October. This species often grows in sandy soils of chaparral. Warner Springs lessingia can be found at elevations between 2,854 and 3,937 feet (869 to 1,199 m) amsl. This species is threatened by grazing and road construction (CNPS 2010). Warner Springs lessingia was not observed within the Survey Area.

**4.2.19 Lemon Lily (CNPS 1B.2)**

Lemon lily is a perennial, bulbiferous herb in the Liliaceae family that flowers between July and August. This species often grows in mesic habitats of lower montane coniferous forest, meadows and seeps, riparian forest, and upper montane coniferous forest. Lemon lily can be found at higher elevations between 4,000 and 9,000 feet (1,219 to 2,743 m) amsl. This species was nearly extirpated from San Diego County, where it was known from only a few plants at the Palomar Mountains. This species is threatened by horticultural collecting, water diversion, recreational activities, and grazing (CNPS 2010). Lemon lily was not observed within the Survey Area.

**4.2.20 Orcutt's Linanthus (CNPS 1B.3)**

Orcutt's linanthus is an annual herb in the Polemoniaceae family that flowers between May and June. This species often grows growing in the openings of chaparral, lower montane coniferous forest, and pinyon and juniper woodland. Orcutt's linanthus can be found at higher elevations between 3,000 and 7,037 feet (914 to 2,144 m) amsl. This species is threatened by foot traffic and recreational activities (CNPS 2010). A total of 665 individuals were observed within Circuit 440 and Circuit 442 of the Survey Area.

**4.2.21 Felt-Leaved Monardella (CNPS 1B.2)**

Felt-leaved monardella is a perennial, rhizomatous herb in the Lamiaceae family that flowers between June and August. This species often grows in chaparral and cismontane woodland. Felt-leaved monardella can be found at elevations between 580 and 5,170 feet (176 to 1,575 m) amsl. This species is threatened by vehicles (CNPS 2010). A total of 7,182 individuals were observed within Circuit 78 and TL 625 of the Survey Area.

**4.2.22 Baja Navarretia (CNPS 1B.2)**

Baja navarretia is an annual herb in the Polemoniaceae family that flowers between June and August. This species often grows in mesic soils in the openings of chaparral, lower montane coniferous forest, meadows and seeps, and pinyon and juniper woodland. Baja navarretia can be found at higher elevations between 4,920 and 7,550 feet (1,499 to 2,301 m) amsl (CNPS 2010). Baja navarretia was not observed within the Survey Area.

**4.2.23 Peninsular Nolina (CNPS 1B.2)**

Peninsular nolina is a perennial, evergreen shrub in the Nolinaceae family that flowers between May and July. This species often grows in sandstone or gabbroic soils in chaparral and coastal scrub. Peninsular nolina can be found at elevations between 460 and 4,183 feet (140 to 1,274 m) amsl. This species is threatened by development, agriculture, road construction, and recreational activities (CNPS 2010). Peninsular nolina was not observed within the Survey Area.

**4.2.24 Moreno Currant (CNPS 1B.3)**

Moreno currant is a perennial, deciduous shrub in the Grossulariaceae family that flowers between February and April. This species often grows in chaparral and riparian scrub. Moreno currant can be found at elevations between 1,113 and 3,937 feet (339 to 1,199 m) amsl. This species is threatened by

recreational activities and vehicles (CNPS 2010). Two individuals were observed along Circuit 442 within the Survey Area.

**4.2.25 San Miguel Savory (CNPS 1B.2)**

San Miguel savory is a perennial shrub in the Lamiaceae family that flowers between March and July. This species often grows in rocky gabbroic or metavolcanic soils in chaparral, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. San Miguel savory can be found at elevations between 400 and 3,530 feet (121 to 1,075 m) amsl. This species is threatened by residential development, foot traffic, agriculture, recreational activities, and horticultural collecting (CNPS 2010). San Miguel savory was not observed within the Survey Area.

**4.2.26 Southern Skullcap (CNPS 1B.2)**

Southern skullcap is a perennial rhizomatous herb in the Lamiaceae family that flowers between June and August. This species often grows in mesic soils in chaparral, cismontane woodland, and lower montane coniferous forest. Southern skullcap can be found at elevations between 1,400 and 6,560 feet (426 to 1,999 m) amsl. This species is threatened by grazing and recreational activities (CNPS 2010). A total of 21 individuals were observed within Circuit 442 and TL 625 of the Survey Area.

**4.2.27 Hammitt's Claycress (CNPS 1B.2)**

Hammitt's claycress is an annual herb in the Brassicaceae family that flowers between March and April. This species often grows in clay soils in the openings of chaparral and valley and foothill grassland. Hammitt's claycress can be found at elevations between 2,360 and 3,500 feet (719 to 1,066 m) amsl. This species is threatened by competition from non-native plants, vehicles, illegal dumping, grazing, and trampling (CNPS 2010). Hammitt's claycress was not observed within the Survey Area during the survey period.

**4.2.28 Laguna Mountain Jewelflower (CNPS 4.3)**

Laguna Mountain jewelflower is a perennial herb in the Brassicaceae family that flowers between May and August. This species often grows in chaparral and lower montane coniferous forest. Laguna Mountain jewelflower can be found at elevations between 2,198 and 8,200 feet (669 to 2,499 m) amsl. This species is threatened by recreational activities, vehicles, and road maintenance (CNPS 2010). A total of 30 individuals were observed within Circuit 79 of the Survey Area.

**4.2.29 Southern Jewelflower (CNPS 1B.3)**

Southern jewelflower is a perennial herb in the Brassicaceae family that flowers between May and July and, on occasion, as early as April. This species often grows in rocky soils of chaparral, lower montane coniferous forest, and pinyon and juniper woodland. Southern jewelflower can be found at elevations between 2,950 and 7,550 feet (899 to 2,301 m) amsl (CNPS 2010). A total of 311 individuals were observed within Circuit 440, TL 626, and TL 629 of the Survey Area.

#### **4.2.30 San Bernardino Aster (CNPS 1B.2)**

San Bernardino aster is a perennial, rhizomatous herb in the Asteraceae family that flowers between July and November. This species often grows in a variety of habitats, typically in vernal mesic soils in cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, valley and foothill grassland, and near ditches, streams, and springs. This plant can be found at elevations between 6 and 6,700 feet (0 to 2,042 m) amsl (CNPS 2010). A total of 5,541 individuals were observed within Circuit 440 and TL 637 of the Survey Area.

#### **4.2.31 Parry's Tetracoccus (CNPS 1B.2)**

Parry's tetracoccus is a perennial deciduous shrub in the Euphorbiaceae family that flowers between April and May. This species often grows in chaparral and coastal scrub. Parry's tetracoccus can be found at elevations between 540 and 3,280 feet (164 to 999 m) amsl. This species is threatened by agriculture and development (CNPS 2010). A total of 181 individuals were observed within TL 637 of the Survey Area.

#### **4.2.32 Velvety False-Lupine (CNPS 1B.2)**

Velvety false-lupine is a perennial rhizomatous herb in the Fabaceae family that flowers between March and June. This species often grows in cismontane woodland, lower montane coniferous forest, meadows and seeps, and valley and foothill grassland. Velvety false-lupine can be found at elevations between 3,280 and 6,140 feet (999 to 1,871 m) amsl. This species is threatened by grazing, trampling, recreation, and competition from non-native plants (CNPS 2010). A total of 1,221 individuals were observed within Circuit 440, and TL 626 of the Survey Area.

### **4.3. DESCRIPTIONS OF OTHER SENSITIVE SPECIES (NON-TARGETED)**

Eighteen plant species listed as sensitive by the CNPS that were not selected as targeted species were also recorded and mapped if observed within the Survey Area. However, not all teams had developed a search image for these non-targeted plants at the beginning of the survey and data presented for these species is inconsistent among teams. Data presented for these species should therefore be treated as ancillary. Exclusion of one of these non-targeted species from a given TL does not constitute the confirmed absence of that species from the entire TL.

#### **4.3.1 San Diego Sunflower (*Bahiopsis [Viguiera] laciniata*) (CNPS 4.2)**

San Diego sunflower is a perennial shrub in the Asteraceae family that flowers between February and June and, on rare occasions, as late as August. This species often grows in chaparral and coastal scrub. San Diego sunflower can be found at elevations between 200 and 2,460 feet (60 to 749 m) amsl. This species is threatened by development (CNPS 2010). A total of 324 individuals were mapped within Circuit 157 and TL 625 of the Survey Area; however, due to the abundance of this species elsewhere within the Survey Area, Chambers Group botanists stopped mapping every location. The number presented here represents an underestimate of the size of San Diego sunflower.

**4.3.2 Brewer's Calandrinia (*Calandrinia breweri*) (CNPS 4.2)**

Brewer's calandrinia is an annual herb in the Portulacaceae family that flowers between March and June. This species often grows in sandy or loamy soils in disturbed or burned areas in chaparral and coastal scrub. This plant can be found at elevations between 32 and 4,000 feet (9 to 1,219 m) amsl (CNPS 2010). A total of 127 individuals were observed within TL 625 of the Survey Area.

**4.3.3 Southern Mountain Misery (*Chamaebatia australis*) (CNPS 4.2)**

Southern mountain misery is a perennial, evergreen shrub in the Rosaceae family that flowers between November and May. This species often grows in gabbroic or metavolcanic soils in chaparral. Southern mountain misery can be found at elevations between 1,000 and 2,300 feet (304 to 701 m) amsl. This species is threatened by agriculture (CNPS 2010). A total of nine individuals were observed within TL 625 of the Survey Area.

**4.3.4 Laguna Mountain Goldenbush (*Ericameria cuneata* var. *macrocephala*) (CNPS List 1B.3)**

Laguna Mountain goldenbush is a shrub in the Asteraceae family that flowers in the fall and winter between September and December. This species often grows in granitic soils in chaparral. Laguna Mountain goldenbush is found at higher elevations between 3,920 and 6,700 feet (1,194 to 2,042 m) amsl. This species is known from only a few locations in the Laguna Mountains (CNPS 2010). A total of 20 individuals were observed within the Survey Area on Circuit 440 on Monument Peak.

**4.3.5 Mexican Flannelbush (FE, Rare, CNPS List 1B.1)**

Mexican flannelbush is a perennial, evergreen shrub in the Malvaceae family that flowers between March and June. This species often grows in gabbroic, metavolcanic, or serpentinite soils in closed-cone coniferous forest, chaparral, and cismontane woodland habitats. Mexican flannelbush can be found at elevations between 100 and 8,038 feet (30 to 2,449 m) amsl. Threats to this species include urbanization (CNPS 2010). One individual of this species was found within TL 6923 of the Survey Area.

**4.3.6 Sticky Geraea (CNPS List 2.3)**

Sticky geraea is a perennial herb in the Asteraceae family that flowers between May and June. This species often grows in disturbed areas in chaparral. Sticky geraea can be found at elevations between 1,476 and 4,921 feet (449 to 1,499 m) amsl. This species is threatened by development (CNPS 2010). A total of 30 individuals were observed within Circuit 157, Circuit 449, TL 625, and TL 629 of the Survey Area.

**4.3.7 San Diego Hulsea (*Hulsea californica*) (CNPS 1B.3)**

San Diego hulsea is a perennial herb in the Asteraceae family that flowers between April and June. This species often grows in openings and burned areas of chaparral, lower montane coniferous forest, and upper montane coniferous forest. San Diego hulsea can be found at elevations between 3,000 and 9,563 feet (914 to 2,914 m) amsl. This species is threatened by competition from non-native plants, fire suppression, recreational activities, and vehicles (CNPS 2010). A total of 160 individuals were observed within Circuit 157, Circuit 440, Circuit 442, and TL 625 of the Survey Area.

**4.3.8 Wright's Hymenothrix (*Hymenothrix wrightii*) (CNPS 4.1)**

Wright's hymenothrix is a perennial herb in the Asteraceae family that flowers between June and October. This species often grows in cismontane woodlands, lower montane coniferous forests, and valley and foothill grasslands at high elevations between 4,600 and 5,100 feet (1,400 to 1,550 m) amsl (CNPS 2010). A total of 2,037 individuals were observed within Circuit 440 of the Survey Area.

**4.3.9 Pride-of-California (*Lathyrus splendens*) (CNPS 4.3)**

Pride-of-California is a perennial herb in the Fabaceae family that flowers between March and June. This species often grows in chaparral. Pride-of-California can be found at elevations between 660 and 5,000 feet (201 to 1,524 m) amsl (CNPS 2010). A total of 104 individuals were observed within TL 6923 of the Survey Area.

**4.3.10 Desert Beauty (CNPS 2.3)**

Desert beauty is an annual herb in the Polemoniaceae family that flowers between April and May. This species often grows in sandy soils in chaparral. Desert beauty can be found at elevations between 3,280 and 4,593 feet (999 to 1,399 m) amsl. This species is threatened by vehicles (CNPS 2010). A total of 607 individuals were observed within TL 629 of the Survey Area.

**4.3.11 Low Bush Monkeyflower (*Mimulus aurantiacus* var. *aridus*) (CNPS 4.3)**

Low bush monkeyflower is a perennial evergreen shrub in the Phrymaceae family that flowers between April and July. This species often grows in rocky areas in chaparral. Low bush monkeyflower can be found at elevations between 2,460 and 3,600 feet (749 to 1,097 m) amsl (CNPS 2010). Only one individual was observed within TL 629 of the Survey Area.

**4.3.12 Cleveland's Bush Monkeyflower (*Mimulus clevelandii*) (CNPS 4.2)**

Cleveland's bush monkeyflower is a perennial, rhizomatous herb in the Phrymaceae family that flowers between April and July. This species often grows in gabbroic soils in openings and disturbed areas, rocky areas in chaparral, cismontane woodland, and lower montane coniferous forest. Cleveland's bush monkeyflower can be found at elevations between 2,673 and 6,561 feet (814 to 1,999 m) amsl (CNPS 2010). This species is threatened by recreational activities. A total of 676 individuals were observed within Circuit 442, Circuit 79, TL 625, and TL 626 of the Survey Area.

**4.3.13 Palomar Monkeyflower (*Mimulus palmeri*) (CNPS 4.3)**

Palomar monkeyflower is an annual herb in the Phrymaceae family that flowers between April and June. This species often grows in sandy or gravelly soils in chaparral and lower montane coniferous forest. This plant can be found at higher elevations between 4,000 and 6,000 feet (1,219 to 1,828 m) amsl. This species is threatened by recreational activities and development (CNPS 2010). A total of 429 individuals were observed within Circuit 442, TL 629 and TL 625 of the Survey Area.

**4.3.14 Cooper's Rein Orchid (*Piperia cooperi*) (CNPS 4.2)**

Cooper's rein orchid is a perennial herb in the Orchidaceae family that flowers between March and June. This species often grows in chaparral, cismontane woodland, and valley and foothill grassland. Cooper's

rein orchid can be found at elevations between 49 and 5,200 feet (14 to 1,584 m) amsl. This species is threatened by urbanization and horticultural collecting (CNPS 2010). A total of five individuals were observed within TL 625 of the Survey Area.

#### **4.3.15 Engelmann Oak (CNPS 4.2)**

Engelmann oak is a perennial, deciduous tree in the Fagaceae family that flowers between March and June. This species is limited to sites above the dry, coastal plain and below cold montane areas forming woodlands and savannas. Engelmann oaks occur at elevations below 4,200 feet (1,280 m) amsl. This species prefers soft, deep, loamy clay; however, they have been known to occur in shallow, rocky soils that have summer moisture (Pavlik et al. 2006). This species is threatened by development and grazing. Only one individual was observed within Circuit 440 of the Survey Area.

#### **4.3.16 Rush-Like Bristleweed (*Xanthisma [Machaeranthera] junceum*) (CNPS 4.3)**

Rush-like bristleweed is a perennial herb in the Asteraceae family that flowers between June and January. This species often grows in chaparral and coastal scrub. Rush-like bristleweed can be found at elevations between 790 and 3,280 feet (240 to 999 m) amsl (CNPS 2010). A total of seven individuals were observed within TL 625 of the Survey Area.
