Valley – Ivyglen Subtransmission Project
CPUC Minor Project Refinement Form

Minor project refinements *are strictly limited to changes that will not trigger an additional permit requirement (except local government ministerial permits and associated requirements), do not substantially increase the severity of a previously identified significant impact based on criteria used in the FEIR, create a new significant impact, are located within the geographic boundary of the study area of the FEIR, and that don't conflict with any mitigation measure or applicable law or policy.*

Date Requested: 09/03/2020

Report No.: [CPUC Compliance Manager fills in]

Date Approved: [date CPUC Compliance Manager sends the approved form back to applicant]

Approval Agency: N/A

Anticipated Start Date for Proposed Action: 10/15/2020

Anticipated End Date for Proposed Action: 3/01/2022

Property Owner(s): Public Right of Way

Land Use/Vegetative Cover: Various, including Residential/Urban/Exotic, Nonnative Grassland, Coast Live Oak Riparian Forest, and Disturbed Riversidean Sage Scrub

Location/Milepost: Segment VIG7. Along north side of Temescal Canyon Road, near Indian Truck Trail.
Sensitive Resources: Disturbed Riversidean sage scrub and coast live oak riparian forest as described in attached biological report.

Modification From: ☐ **Permit** ☒ **Plan/Procedure** ☐ **Specification** ☐ **Drawing**
☐ **Mitigation Measure** ☐ **Other:**

Describe the proposed minor Project refinement, including how project refinement deviates from current project and an explanation for why the refinements are necessary:

Proposal for an alternative shoofly in Segment VIG7:
Section 2.4.5.4 of the FEIR describes the shoofly line to be installed along Temescal Canyon Road along the westernmost 0.5 miles of the 115-kV Segment VIG7 to the start of Segment VIG8. A shoofly maintains electrical service to an area while allowing sections of permanent line to be taken out of service for construction activities.

The shoofly route proposed in NTPR-2 (referred to here as Option 1) is located south of the 115-kV VIG line, on the south side of Temescal Canyon Road. This alignment was preferred because it would allow for an energized transfer of the 115-kV line from the shoofly poles to the permanent structures if an electrical outage was not available. Although this was the preferred route, unforeseen difficulties in property acquisition will prevent its use. Option 1 requires the acquisition of four private parcels, at least one of which would require a condemnation. COVID-19 restrictions are significantly delaying the condemnation process in the courts, which will prevent the property from being acquired in time to meet the outage-

driven construction schedule.

In MPR No. 4, we propose an alternative shoofly route (Option 2) on the north side of Temescal Canyon road. The shoofly poles and anchors would be installed first. An electrical outage would be necessary to connect the shoofly to existing structures. This route is within public right-of-way and would not require additional property acquisition.

Portions of two of the requested work areas, totaling 0.053 acres (2,306 square feet), are located outside of the general disturbance area. The first would provide work area north and east of pole 4765632E, the second would provide work area for temporary guy anchor to support pole 4765631E.

Describe the dimensions and area of any additional work areas and land disturbance associated with the proposed refinements. Include/attach photos, maps, or other documentation illustrating the existing conditions in the area:

The Option 2 shoofly would require the installation of 11 temporary direct-bury wood poles (4765628E-4765638E), and five temporary guy anchors as shown in Figures 1 and 2, and as described in Table 1. Figures 1 and 2 show the NTPR-2-proposed Option 1 shoofly route (pink line), the MPR No. 4 Option 2 shoofly route (yellow line), and the proposed additional work areas (green polygons).

Figure 1. Proposed Additional Work Areas Requested in MPR No. 4. Option 2 Shoofly Structures 4765628E–4765632E.

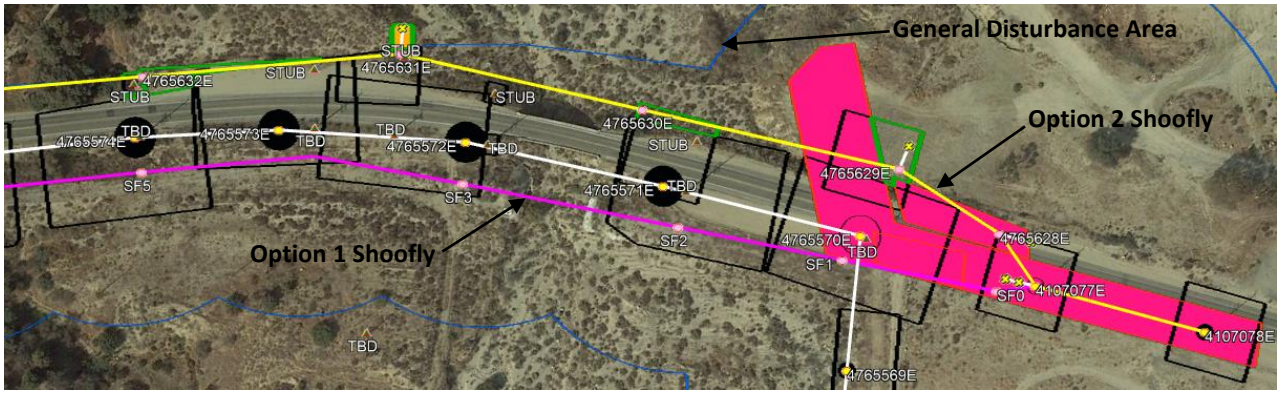

Figure 2. Proposed Additional Work Areas Requested in MPR No. 4. Option 2 Shoofly Structures 4765633E–4765638E.

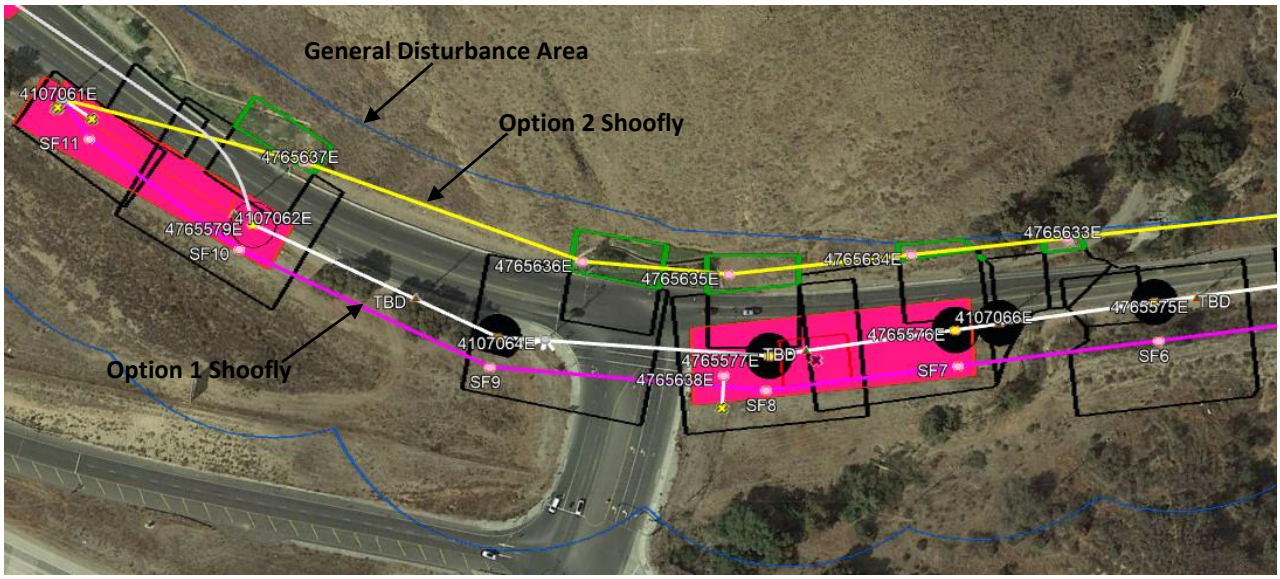

Table 1. Description of Option 2 Disturbance Areas Requested in MPR No. 4.

Segment	Structure	Latitude	Longitude	Description
VIG7	4765628E	33.74751	-117.44550	Installation of a wood pole and guy anchor within a previously approved work area.
VIG7	4765629E	33.74785	-117.44577	3,540 square feet of temporary work area for a wood pole and guy anchor.
VIG7	4765630E	33.74838	-117.44665	1,576 square feet of temporary work area for wood pole.
VIG7	4765631E	33.74886	-117.44745	Installation of a temporary wood pole within a previously approved work area and 760 square feet of temporary work area for a guy anchor located outside of the general disturbance area.
VIG7	4765632E	33.74913	-117.44845	2,800 square feet of temporary work area for a wood pole, of which 1,546 square feet is outside of the general disturbance area.
VIG7	4765633E	33.74944	-117.44957	808 square feet of temporary work area for a wood pole.
VIG7	4765634E	33.74958	-117.45010	1,210 square feet of temporary work area for a wood pole.
VIG7	4765635E	33.74975	-117.45073	3,640 square feet of temporary work area for a wood pole.
VIG7	4765636E	33.74997	-117.45120	4,707 square feet of temporary work area for a wood pole.
VIG7	4765637E	33.75058	-117.45196	3,809 square feet of temporary work area for a wood pole and guy anchor.
VIG7	4765638E	33.74949	-117.45090	Installation of a wood pole and guy anchor within a previously approved work area. 4765638E, located on the south side of Temescal Canyon Road, serves as a stub pole supporting 4765635E.

The Option 2 shoofly would require 0.52 acres (22,850 square feet) of additional temporary disturbance area. Impacts associated with excavating pole holes would be temporary and because the Option 2 shoofly poles would eliminate the need for Option 1 poles, there would be no net change to impacts from pole excavations. There are no permanent impacts associated with MPR No. 4.

Following the completion of all construction, the shoofly poles would be removed, the holes would be filled, and work areas would be restored/reclaimed in accordance with the Project linear SWPPP, Project Commitment D, and the VIG Habitat Restoration and Revegetation Plan.

Environmental impact analysis for use of the above described areas was conducted as part of this MPR and is provided in the attached biological (Attachment A), cultural (Attachment B), and paleontological reports (Attachment C).

The 0.52 acres of temporary disturbance associated with MPR No. 4 is consistent with what is described in Table 2-5 of the FEIR. Section 2.4.2.1 of the FEIR states that construction of VIG would disturb approximately 633.7 acres of land, including approximately 141.5 acres of permanent disturbance. Total impacts for all VIG NTPRs/MPRs are anticipated to be below the quantities given in the FEIR. If quantities in future NTPRs/MPRs exceed the FEIR, an explanation of significance will be provided.

Provide a summary list of applicable Project requirements (e.g., MMs, etc.) for which the refinements are being requested:

No refinements to the Project requirements are being requested. The existing Project requirements will be followed, as applicable, for the newly requested area.

Would the proposed refinements conflict with any of the above-listed MMs or other Project requirements or applicable laws, regulations, or policies?	**No**	**Yes**
Explain proposed refinements consistency/inconsistency with applicable Project requirements below.	☒	☐

The proposed refinements do not conflict with any of the project commitments or mitigation measures listed in FEIR Section 9 Mitigation Monitoring, Compliance, and Reporting Plan

Would the Proposed Project refinements result in a new impact, or increase the severity of a previously analyzed impact on:	No	Yes
Aesthetics (e.g. damage scenic resources or vistas, degrade the existing visual character of the site and its surroundings, or create sources of light or glare)?	☒	☐

Summary of Proposed Project Refinement Impacts on Aesthetics:

The proposed disturbance and work areas for the Option 2 shoofly are consistent with the descriptions provided in Sections 2.3.1.1, 2.4.5.4, and Table 2-5 of the FEIR, that describe the installation and later removal of approximately 10 temporary wood shoofly poles within 2.6 acres of temporary disturbance. The Option 2 shoofly includes 10 temporary wood poles as well as an eleventh wood pole that serves as a temporary stub pole for 4765635E.

Aesthetic impacts associated with these refinements do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.1.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Agriculture and Forestry (e.g. convert farmland to non-agricultural use, or forest land to non-forest use, or create a conflict with existing agricultural zoning or a Williamson Act)?	☒	☐

Summary of Proposed Project Refinement Impacts on Agriculture and Forestry:

The proposed work areas are not located on land designated as farmland or forest. Impacts associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.2.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Air Quality (e.g. violate any air quality standard, or produce criteria air pollutant emissions, or expose sensitive receptors to addition pollutants)?	☒	☐

Summary of Proposed Project Refinement Impacts on Air Quality:

Activities occurring at the proposed locations and the types of equipment and vehicles used are consistent with the activities described in Section 2.3.1.1 of the FEIR. Impacts resulting from MPR No. 4 would replace similar impacts previously proposed in NTPR-2. Impacts to air quality associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.3.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Biological Resources (e.g. have an adverse effect on sensitive or special-status species; impact riparian, wetland, or any other sensitive habitat; or interfere with the movement of native resident or migratory fish or wildlife)?	☒	☐

Previous Biological Survey Report Reference:

The proposed work areas were included in previous biological surveys for the FEIR, as described in the biological report (Attachment A).

Summary of Proposed Project Refinement Impacts on Biological Resources:

The proposed work activities would avoid wetlands and waterways; no amendments to the waters permits would be needed. Five of the proposed shoofly work areas occur within or partially within disturbed Riversidean sage scrub (DRSS): 4765629E–4765632E, and 4765638E. In accordance with MM BR-5, removal of Riversidean sage scrub habitat would not occur during the coastal California gnatcatcher breeding season. Following the completion of construction and removal of the temporary shoofly poles, the work areas would be restored/reclaimed in accordance with the Project linear SWPPP, Project Commitment D, and the VIG Habitat Restoration and Revegetation Plan (HRRP).

The proposed work area for 4765632E overlaps with coast live oak riparian forest (CLORF). Prior to construction, the CLORF area will be flagged as an ESA and fenced to prevent construction activities from occurring within the ESA. Construction monitors will ensure compliance with the ESA boundary.

The activities described in MPR No. 4 do not create a new significant impact or a substantial increase in the severity of an identified impact listed in Section 4.4.4.2 of the FEIR. Indirect impacts that may occur to sensitive species in the vicinity of the proposed work areas would be mitigated in accordance with the Project Commitments and Mitigation Measures.

All of the proposed features are within the WR-MSHCP Phase 2 certificate of inclusion (COI) coverage area, except for a small amount of work area for pole 4765632E. Based on the guidance provided by the RCA, the use of this work area does not require notification to the RCA because the temporary disturbance to occur would not pose a significant impact to sensitive vegetation of concern. All temporary impacts to vegetation will be restored in accordance with the HRRP.

The proposed work areas are covered under the Stephens' kangaroo rat Habitat Conservation Plan as depicted in the biological resource maps (Attachment A). All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Cultural Resources (e.g. cause an adverse change to a significant historical, archeological, paleontological, or tribal resource or disturb any human remains)?	☒	☐

Summary of Proposed Project Refinement Impacts on Cultural Resources:

The proposed refinements were included in the cultural and paleontological resource analyses (Attachments B & C). Cultural and tribal monitoring would be conducted in accordance with the CRMTP. Paleontological monitoring, spot checking, and fossil recovery would be implemented for excavations at the proposed work areas in accordance with the Project's PRMP. If a resource is found at the site, SCE would comply with the procedures for unanticipated discoveries provided in MMs CR-1b, CR-4, CR-5, CR-7, the CRMTP, and the PRMP. Impacts to cultural resources associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.5.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Geology, Soils, and Seismicity (e.g. expose people or structures to risk of loss, injury, or death involving seismic-related ground failure including liquefaction or landslides, be located on a geologic unit, unstable soil, or expansive soil)?	☒	☐

Summary of Proposed Project Refinement Impacts on Geology, Soils, and Seismicity:

Erosion would be controlled at locations of earth disturbance through the implementation and adherence to the Project linear SWPPP. Following approval of MPR No. 04, the SWPPP would be updated to show the proposed work areas. At the completion of all construction, sites would be restored/reclaimed in accordance with the Project linear SWPPP, Project Commitment D, and the VIG Habitat Restoration and Revegetation Plan.

Impacts to geology, soils, and seismicity associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.6.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Greenhouse Gas Emissions (e.g. generate a substantial amount of greenhouse gas [GHG] emissions, conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing emissions or GHGs)?	☒	☐

Summary of Proposed Project Refinement Impacts on Greenhouse Gas Emissions:

Activities occurring at the proposed locations and the types of equipment used are consistent with the activities described in Section 2.3.1.1 of the FEIR. The type and quantity of construction equipment would be the same as identified in NTPR-2; the areas requested do not require the use of additional equipment. In compliance with MM AQ-1, NOX and PM emissions from off-road diesel-powered construction equipment would be minimized to the extent feasible by using Tier 4 interim or Tier 4 Standards for equipment with engines greater than 150 horsepower.

Per MM AQ-2, daily emissions of equipment would be tracked to ensure NOX emissions stay within the NOX Regional Clean Air Incentive Market Trading Credits (RTCs) purchased for the Project. Impacts to greenhouse gas emissions associated with this refinement do not create a new significant impact or a

substantial increase in the severity of a previously identified impact identified in Section 4.7.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Hazards and Hazardous Materials (e.g. create hazards to public or environment through transport, use, disposal, or accident conditions of hazardous materials, be located on a site of hazardous materials, or expose people and structures to loss, injury of death involving wildland fires)?	☒	☐

Summary of Proposed Project Refinement Impacts on Hazards and Hazardous Materials:

Activities occurring at the proposed locations are consistent with the activities described in Sections 2.3.1.1 of the FEIR. All proposed locations are within the 1,000-foot corridor evaluated for solid waste disposal sites, Cease and Desist Orders, or Cleanup and Abatement orders per Section 4.8.1.1 of the FEIR. Planned ground-disturbing activities includes drilling of holes for wood pole installation. In the event of an inadvertent discovery, SCE would follow the procedures in Project's Contaminated Soil and Groundwater Contingency Plan. Proposed work areas in VIG7 are located within a Very High Fire Hazard Zone. Fire danger mitigation would be implemented in accordance with the Project Emergency Action Plan and Fire Control and Emergency Response Plan. Impacts to hazards and hazardous materials associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.8.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Hydrology and Water Quality (e.g. violate water quality standards or discharge waste requirements, alter the existing drainage pattern creating additional sedimentation, runoff water, or polluted runoff, or inundate by seiche, tsunami, or mudflow)?	☒	☐

Summary of Proposed Project Refinement Impacts on Hydrology and Water Quality:

The proposed refinements are located within the Santa Ana Watershed. The proposed work areas are not located within a flood zone. Structures 4765628E and 4765629E are located within 580 feet of Lee Lake. The Temescal Wash streambed is located between Structures 4765630E and 4765631E, and 4765632E and 4765633E.

Erosion that could affect water quality would be controlled at locations of earth disturbance through the implementation and adherence to the Project linear SWPPP. If stained or odorous soil is found during excavating, SCE would follow the procedures in Project's Contaminated Soil and Groundwater Contingency Plan. Dewatering, if necessary, would be performed in accordance with the Project linear SWPPP.

Impacts to hydrology and water quality associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.9.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Land Use and Planning (e.g. physically divide an established community; conflict with a land use plan, policy, or regulation of an agency with jurisdiction over the project, or conflict with a habitat conservation plan)?	☒	☐

Summary of Proposed Project Refinement Impacts on Land Use and Planning:

The land use would remain unchanged at proposed work areas and the shoofly poles to be installed are temporary. Installation of the temporary shoofly poles is consistent with the activities described in Section 2.3.1.1 and Table 2-1 of the FEIR. Impacts to land use and planning associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.10.4 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Mineral Resources (e.g. result in the loss of known mineral resources of regional and/or state value, or availability of locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan)?	☒	☐

Summary of Proposed Project Refinement Impacts on Mineral Resources:

The proposed work areas are located in Mineral Resource Zone (MRZ) 3a indicating a likely but undetermined significant mineral resource. The proposed temporary disturbances were included in the description of Project activities in Section 2.3.1.1 of the FEIR. Impacts to mineral resources associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.6.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Noise and Vibration (e.g. expose sensitive receptors to additional noise or vibration, exposure of persons to or generation of excessive noise, ambient noise, ground-borne noise, or vibration)?	☒	☐

Summary of Proposed Project Refinement Impacts on Noise and Vibration:

Activities occurring at the proposed locations and the types of equipment used are consistent with the activities described in Section 2.3.1.1 of the FEIR. Implementation of the Project Noise Control Plan would ensure noise reduction measures are performed as required. Blasting would not occur at the proposed locations.

Impacts to noise and vibration associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.11.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Population and Housing (e.g. directly or indirectly induce substantial population growth in an area, or displace substantial numbers of people or existing housing)?	☒	☐

Summary of Proposed Project Refinement Impacts on Population and Housing:

The proposed refinements would not increase or displace populations. Impacts to population and housing associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.12.4 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Public Services and Utilities (e.g. result in substantial adverse physical impacts on government facilities that provide a public service or cause environmental impacts to service ratios, response times, or other performance objectives to fire protection, sheriff protection, schools, parks, or other public facilities)?	☒	☐

Summary of Proposed Project Refinement Impacts on Public Services and Utilities:

The proposed refinements would not increase the need for or physically alter any public services. Impacts to public services and utilities associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.13.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Recreation (e.g. increase the use of, or cause adverse effects on, existing neighborhood, parks, or other recreational facilities)?	☒	☐

Summary of Proposed Project Refinement Impacts on Recreation:

Lee Lake/Corona Lake, is identified as a recreational area in Section 4.14 of the FEIR and is in close proximity to the east end of the proposed refinements. However, the proposed refinements would not cause deterioration to any recreational facilities and would not overlap or impact the use of trails. Impacts to recreation associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.14.4 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Transportation and Traffic (e.g. increase hazards due to design feature, result in inadequate emergency access, or conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities)?	☒	☐

Summary of Proposed Project Refinement Impacts on Transportation and Traffic:

Activities occurring at the proposed locations are consistent with the activities described in Section 2.3.1.1 of the FEIR. The quantity of construction equipment and personnel would be the same as identified in NTPR-2. Adherence to the Project Traffic Management and Control Plan would ensure compliance with traffic-related Project mitigation measures, TT-1, TT-2, and TT-7. There would be no change to the access routes identified in the Traffic Management and Control Plan.

Impacts to transportation and traffic associated with this refinement do not create a new significant impact or a substantial increase in the severity of a previously identified impact identified in Section 4.15.4.2 of the FEIR. All applicable avoidance/minimization measures identified in FEIR Chapter 9 Mitigation Monitoring, Compliance, and Reporting Plan would be followed.

Describe any applicable consultation with other governmental agencies conducted for the proposed refinements:

No consultation with other governmental agencies was necessary or conducted for the proposed refinement.

SUBJECT: BIOLOGICAL REVIEW FOR THE VALLEY-IVYGLEN SUBTRANSMISSION LINE PROJECT NOTICE TO PROCEED REQUEST #2

PREVIOUSLY COMPLETED SURVEYS

Biological surveys were completed previously for the Valley-Ivyglen Subtransmission Line (VIG) Project, presented herein for Phase 2 (Segments 4-8), including the Catfish 74 Yard, Orange Yard, and Chaney Yard-Alternative, as Notice to Proceed Request #2 (NTPR #2; throughout this document, refer to Exhibit 1, Map Pages 1-20). Previous surveys also included the southern half of the Concordia Yard. Recent surveys in December 2019 covered the northern half of the Concordia Yard and vicinity. These surveys are presented in the Additional Surveys Completed for the Concordia Yard Section of this report.

Please note all proposed work areas with planned Project impacts to jurisdictional waters, Riparian/Riverine resources, or otherwise protected aquatic features within Phase 2 are not requested as a part of this NTPR #2. Several locations within Segments 4, 5, 6, and 8 (none in Segment 7) have been excluded from this NTPR, and will be included in a separate NTPR once permits are obtained to impact these aquatic features under the jurisdiction of U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW). Any work areas that intersect protected aquatic features and are not included in the list below are areas that are planned for avoidance and will not be permitted. The protection of aquatic resources will be managed through establishment of clearly marked environmentally sensitive areas (ESAs), staging of equipment and materials outside the resource, monitoring during adjacent construction, and other best management practices discussed in this report.

NTPR #2 would include all work in Segments 4-8 as described in the VIG Final Environmental Impact report (FEIR), with the exclusion of locations that require jurisdictional waters permits, described as follows:

Segment 4

- Structure work within the channel at Structures 338, 339, 340, 341, 342, 343, and 344 (Map Pages 1 and 2);
- Structure work within the ephemeral streambed at Structure 344 (Map Page 2);
- Structure work within the wetland at Structure 369 (Map Page 3);
- Structure work, wire work, and tree trimming within the wetland/riparian area at Structure 370 (Map Page 3);
- Structure work within the wetland at Structure 372 and tree trimming before and after Structure 372 (Map Pages 3 and 4); and

- Structure work within the riparian area at Structure WP1 (Map Pages 3 and 4).

Segment 5

- Structure work within the ephemeral streambed/riparian area at Structure 413 (Map Page 6);
- Structure work within the ephemeral streambed/riparian area at Structure 421 (Map Page 6);
- Structure and access road work within the ephemeral streambed at Structure 424 (Map Page 6);
- Structure work within the riparian area at Structure 449 (Map Page 8);
- Structure and access road work within the ephemeral streambed/riparian area at Structures 481 and FIG-015 (Map Page 10);
- Tree trimming within the riparian area between Structures 481 and 482 and between FIG-015 and FIG-016 (Map Page 10);
- Guard pole work within the ephemeral streambed/riparian area at Structures FIG-030 (Map Page 11);
- Structure work within the riparian area at Structure FIG-039 (Map Page 11); and
- Structure work within the ephemeral streambed at Structure FIG-048 (Map Page 11).

Segment 6

- Structure work within the ephemeral streambed/riparian area at Structure 520 (Map Pages 11 and 12);
- Tree trimming within the riparian area between Structures 520 and 521 (Map Pages 11 and 12);
- Structure and access road work within the riparian area at Structure 522 (Map Pages 11 and 12);
- Tree trimming within the wetland/riparian area between Structures 522 and 523 (Map Pages 11 and 12);
- Structure work areas and overland travel to two poles labeled "TBD" located west and northwest of Structure 525
- Gabion basket and access road work within the ephemeral streambed leading to Structures 528 and 529 (Map Page 13); and
- Gabion basket and access road work within the riparian area leading to Structures 533 (Map Pages 13 and 14).

Segment 8

- Structure work within the ephemeral streambed at Structure 574 (Map Pages 16 and 17);
- Structure work within the ephemeral streambed/riparian area at Structure 580 (Map Page 20); and
- Structure and wire work within the ephemeral streambed/riparian area at Structures 581 and 044 (Map Page 20).

Relevant biological resources surveys conducted on Phase 2 for this NTPR #2, including within the yards listed above, are discussed below.

PROTECTED AQUATIC RESOURCES

Preliminary jurisdictional waters and wetlands delineations for Phase 2were conducted by AMEC in 2011, 2012, 2013, and 2015. In 2018, Environmental Intelligence (EI) conducted a formal jurisdictional delineation, including a supplemental delineation in 2019, within 500 feet of the project footprint for Phase 2 utilizing the latest available guidance, methodologies, and regulatory frameworks to map the location, type, and extent of Riparian/Riverine resources consistent with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

Methods

The jurisdictional delineation surveys were conducted according to the technical guidelines provided in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; 2008 Supplement; USACE 2008) to identify and delineate wetlands that may be subject to regulatory jurisdiction under Section 404 of the Clean Water Act (CWA). Wetlands were identified by the "three-factor" approach, in which criteria for wetland hydrology, hydrophytic vegetation, and hydric soils must all be met to conclude that an area is a wetland, as described in the Manual and summarized below. Wetlands that appeared to meet the USACE criteria were considered potentially jurisdictional (since any determination is subject to verification by the regulatory agencies).

"Waters of the U.S." were identified pursuant to criteria outlined in Sections 401 and 404 of the CWA, including but not limited to the presence of an ordinary high-water mark (OHWM) and connection to a downstream jurisdictional water body. The OHWM was determined pursuant to the USACE 2008 *Field Guide to the Identification of the OHWM in the Arid West Region of the Western United States* by observing signs of flow including but not limited to shelving, drift lines, and disturbed vegetation. "Waters of the State" were identified pursuant to criteria outlined in Section 1600 of the California Fish and Game (CFG) Code, including the presence of a defined bed and bank and any associated vegetation. Drainages that appeared to meet the criteria for "waters of the U.S." or "waters of the State" were considered potentially jurisdictional as any determination is subject to verification by the regulatory agencies.

The MSHCP Riparian/Riverine aspect of the surveys assessed features that met the definition of MSHCP for these protected waters features. MSHCP Riparian resources are defined as "lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend upon soil moisture from a nearby fresh water source." MSHCP Riverine resources are defined as unvegetated ephemerals that transport water supporting downstream resources in the MSHCP Conservation Area. For the purposes of determining the extent of MSHCP Riparian/Riverine resources occurring within the Proposed Project Study Area, this analysis included streambed/banks and associated riparian vegetation under the jurisdiction of the CDFW, waters and wetlands under the jurisdiction of the USACE and the RWQCB, as well as other features that met the MSHCP definition of a Riparian/Riverine resource as presented in Section 6.1.2 of the MSHCP.

Results

Western Riverside County is dominated by ephemeral washes that convey flows south and west out of the hills through the San Jacinto River Watershed to Lake Elsinore, whereas within Phase 2 Temescal Creek conveys flows north form Lake Elsinore contributing to the Santa Ana River Watershed. The majority of jurisdictional and MSHCP Riparian/Riverine resources in the Project area include features associated with Temescal Creek (Map Pages 1-20) including wetlands, riparian extent, tributary waters, basins, culverts, roadside ditches, swales, streambanks, and other waters (i.e., basin beds and open waters).

Three seasonally ponded areas were observed that meet the criteria for vernal pools under the MSHCP, but did not meet the USACE three-parameter wetland criteria. These pools had limited access on private property and it was not determined if these were vernal pools. Two pools were observed north and south of Baker Street near Structures 401-403 (Map Page 5), and one large pond was observed in a Riverside County conservation area at the intersection of Alberhill Ranch Road and Nichols Road near Structure 436 (Map Page 7). No impacts to the Riverside County conservation area ephemeral pool are anticipated, as this feature is well outside the proposed impact areas. The ephemeral pools observed north and south of Baker Street are located outside the proposed impact areas and will therefore be avoided entirely during construction.

Conclusions

The VIG Project is designed to avoid jurisdictional and MSHCP Riparian/Riverine resources throughout Phase 2 to the greatest extent practical. Direct and indirect impacts to these features will be avoided by perimeter marking, careful siting of work areas, and appropriate water use and soil movement measures. For this NTPR, Project construction will not occur in areas pending jurisdictional waters permits where

impacts to waters of the U.S. and other waters of the State are planned. As mentioned above, there are several construction work areas that are excluded from this NTPR to avoid aquatic resources. A summary of those impacts which overlap MSHCP Riparian/Riverine resources are provided below.

The following discussion is to address impacts associated with MSHCP Riparian/Riverine and other jurisdictional resources within Phase 2 for which a request for notice to proceed will be included in a separate, future NTPR:

- Temporary impacts to Riparian areas will result from working within or in proximity to those habitat features and include an approximate total of 0.450 acre, and temporary impacts to Riverine areas will result from working within or in proximity to channelized features, totaling 0.284 acre.
- Permanent impacts to Riparian features will result from grading and construction of unpaved roadways, poles, and one gabion, and include an approximate total of 0.109 acre. Permanent impacts to Riverine features will primarily result from grading and construction of unpaved roadways, poles, and installation of gabions, totaling 0.073 acre. Additionally, riparian vegetation may require trimming between Poles 369-375, 478-482, 015-016, 520-523, and 580-581 to ensure proper line clearance within the Gunnerson Pond area and Temescal Wash. These areas may be annually or bi-annually maintained and trimmed by hand, under future operation and maintenance activities according to the California Public Utilities Commission and other safety standards, and are therefore determined to be permanent impacts. Permanent impacts from tree trimming were estimated at 0.146 acre. Nevertheless, such permanent impacts to Riparian areas from hand trimming of trees for power line clearance are considered "temporally passive edge effects" and are not expected to cause permanent loss through mortality of any riparian vegetation. Therefore, the Project's permanent impacts to Riparian areas from tree trimming would not adversely affect the functions and values of this habitat.

Unavoidable impacts would be minimized and mitigated in accordance with the provisions set forth by the USACE, RWQCB, and CDFW and MSHCP. No vernal pool impacts will occur. SCE is in the process of obtaining the following authorizations and permits for both Phase 1 and Phase 2 concurrently:

- CWA Section 404 permit for discharge (placement) of dredged or fill material within waters of the U.S. under the purview of USACE;
- CWA Section 401 state water quality certification for an action that may result in the discharge of pollutants into waters of the U.S. and state under the purview of RWQCB; and
- CFGC Section 1600 *et seq.* Lake and Streambed Alteration Agreement if planned activities would result in the substantial, adverse impacts to the bed and/or bank (including the associated riparian extent) of a stream (waters of the state, exclusively) under the purview of CDFW.

SCE has also submitted a MSHCP Participating Special Entity (PSE) Application that included an amended Determination of Biologically Equivalent or Superior Preservation (DBESP) for unavoidable impacts to Riparian/Riverine resources for Phase 2. The DBESP included a Riparian/Riverine resources impacts analysis and applicable mitigation measures.

Vehicles and equipment will follow the best management practices discussed in Mitigation Measure (MM) BR-1: Limit Construction to Designated Areas and Avoid Riparian, Aquatic, and Wetland Areas. Additionally, biological construction monitoring will occur during work on Phase 2 where there is the potential to impact jurisdictional or Riparian/Riverine resources.

Avoidance and minimization measures to further reduce impacts to Riparian/Riverine resources include implementation of Project Commitment B (Worker Environmental Awareness Program [WEAP]), Project Commitment D (Habitat Restoration and Revegetation Plan), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-4 (Limit Removal of Native Vegetation Communities and Trees), MM BR-7 (Habitat Restoration and Revegetation Plan Requirements), MM BR-

9 (Invasive Plant Control Measures), MM BR-13 (Trash Abatement), and MM BR-15 (Stormwater Pollution Prevention Plan [SWPPP]).

BOTANICAL SURVEYS

Focused botanical surveys for Phase 2 included a reconnaissance-level habitat assessment by AMEC in 2006, with focused botanical surveys conducted by AMEC in 2007. Additional focused botanical surveys were conducted by AMEC and Chambers Group in 2009; by University of California Riverside and AMEC in 2011, 2012, 2013, and 2014; by AECOM in 2015; by EI and Sage Institute in 2017; and by EI and Garcia and Associates in 2018.

Methods

Phase 2 focused botanical surveys conducted in in 2007 followed the *Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered Plants and Natural Communities* (California Department of Fish and Game [CDFG] 2006) and the California Native Plant Society (CNPS) *Botanical Survey Guidelines* (CNPS 2001). Phase 2 focused botanical surveys conducted between 2009 and 2018 followed the CDFG *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFG 2009) and the 2001 CNPS guidelines.

Focused surveys for special-status plant species and invasive plants/noxious weeds were conducted during the appropriate blooming season within all proposed work areas, plus a 100-foot buffer. The survey areas were traversed by foot, following meandering transects that were intuitively controlled, meaning the biologists determined the appropriate spacing, pace, direction, and duration of the surveys to provide 100 percent survey coverage in a given area. These variables were in turn determined by the vegetation community type and cover, slope, and aspect.

Results

Within Phase 2 (Segments 4-8), during botanical field studies conducted to date (2007, 2009, 2011-2015, and 2017-2019), 21 special-status plant species were detected, as follows:

- Yucaipa onion *Allium haematochiton/marvinii* (*Allium haematochiton/marvinii*; Map Page 6);
- chaparral sand verbena (*Abronia villosa* var. *aurita*; Map Pages 11, 16, 17, 18, and 19);
- Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*; Map Pages 5, 6, and 18);
- Coulter's matilija poppy (*Romneya coulteri*; Map Pages 11-20);
- Engelmann oak (*Quercus engelmannii*; Map Pages 13, 14, and 15);
- little mousetail (*Myosurus minimus*; Map Pages 5 and 6);
- long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*; Map Pages 14 and 15);
- Munz's onion (*Allium munzii*; Map Pages 4, 7, 10, 11, and 14-17);
- Palmer's grapplinghook (*Harpagonella palmeri*; Map Pages 4, 6, 7, 10, 11, and 14 through 17);
- paniculate tarplant (*Deinandra paniculata*; Map Pages 1-6);
- peninsular spineflower (*Chorizanthe leptotheca*; Map Pages 15 and 16);
- Robinson's peppergrass (*Lepidium virginicum* var. *robinsonii*; Map Pages 1, 11, 15, and 16);
- round-leaved filaree (California macrophylla; Map Page 4);
- San Diego ambrosia (*Ambrosia pumila*; Map Pages 4, 5, 6, and 9);
- San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*; Map Pages 5 and 6);
- slender-horned spineflower (*Dodecahema leptoceras*; Map Pages 15 and 16);
- small-flowered microseris (*Microseris douglasii* var. *platycarpha*; Map Pages 3, 4, 5, 7, 10, 11, and 14-17);
- small-flowered morning-glory (*Convolvulus simulans*; Map Pages 4-7, 15, 16, and 17);

- smooth tarplant (*Centromadia pungens* ssp. *laevis*; Map Pages 1-4)
- vernal barley (*Hordeum intercedens*; Map Pages 3 and 4); and
- white rabbit-tobacco (*Pseudognaphalium leucocephalum*; Map Pages 3 and 4).

Oaks (*Quercus* spp.) with varying degrees of introgression between *Quercus engelmannii* (Engelmann oak) and *Quercus berberidifolia* (inland scrub oak) were encountered along the terrace escarpments south of Interstate 15 in Temescal Canyon. Two individuals exhibiting morphological features more towards *Quercus engelmannii* were mapped north of and between Structures 531 and 532 (Map Pages 13 and 14) and south of Structure 549 (Map Page 15); however, these trees are located entirely outside of any work area and will be not be affected by the Project.

Coast live oak (*Quercus agrifolia*) trees are located along the Project study area. The intent is that oak tree removal will be avoided to the greatest extent possible. However, some trimming of oak trees is anticipated. Oak tree removal and pruning within county highway rights-of-way will be done in accordance with the applicable Riverside County tree protection ordinances.

Results of invasive plant and noxious weed surveys can be found in the Invasive Plant Management Plan developed for the Project.

Conclusions

MSHCP Adequately Conserved Species (note: these are species that, if impacted, do not require additional mitigation) observed within Phase 2 include small-flowered morning glory, Palmer's grapplinghook, long-spined spineflower, and vernal barley. Coverage of these species will be granted through participation in the MSHCP.

Portions of the Project alignment occur within Narrow Endemic Plant Species Survey Area (NEPSSA) 1 of the MSHCP. The Narrow Endemic Plant Species (NEPS) required to be surveyed for in NEPSSA 1 include Munz's onion, San Diego ambrosia, slender-horned spineflower, many-stemmed dudleya (*Dudleya multicaulis*), spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), San Miguel savory (*Satureja chandleri*), Hammitt's clay-cress (*Sibaropsis hammittii*), and Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*). For NEPS populations identified within designated NEPSSAs as part of the survey process, permanent impacts to 90 percent of those portions of the property that provide for long-term conservation value (LTCV) of the identified NEPS will be avoided until it is demonstrated that species-specific conservation objectives for the particular species are met. Findings of equivalency will be made to demonstrate that the 90-percent standard has been met. If it is determined that the 90-percent standard cannot be met and achievement of overall MSHCP conservation goals for the particular species have not yet been demonstrated, a DBESP would be required.

Three MSHCP NEPS that have been identified within the Project study area to date include Munz's onion, San Diego ambrosia, and slender-horned spineflower within NEPSSA 1. Impacts to these three species will not exceed the 10 percent MSHCP permanent impact threshold, and there are no permanent impacts to the LTCV of these NEPS; therefore, additional mitigation in a DBESP would not be required. However, there are temporary impacts to these species, and with implementation of the proposed avoidance/minimization measures, temporary impacts would not be considered significant and the Project is consistent with MSHCP Section 6.1.3.

To further avoid and/or minimize potential impacts to the San Diego ambrosia specifically, the Project will implement the San Diego ambrosia mitigation measure Project Commitment L. Impacts to this species will be minimized by timing construction in the late summer/early fall to protect San Diego ambrosia. Furthermore, there are other measures that can be implemented to reduce or alleviate soil compaction, such as placing metal grates or plywood sheets (depending on size of equipment) over the plants temporarily. Other measures to avoid/or minimize potential impact to Munz's onion, San Diego ambrosia, and slender-horned spineflower will be implemented such as the use of a qualified biologist(s) for crew training, minimizing disturbance footprints, and monitoring construction activities to avoid impacts to sensitive species and habitats. All plant surveys have been completed as required by the MSHCP, mitigation has

been proposed where applicable, and "take" authorization is anticipated to be granted pursuant to the MSHCP. As such, no additional mitigation is required for these species even in the event of an unanticipated discovery during pre-construction surveys or during construction.

In summary, Phase 2 is consistent with the goals, objectives, and requirements of MSHCP Section 6.1.3 relative to the NEPS Munz's onion, San Diego ambrosia, and slender-horned spineflower. Further, the two (2) individuals of Engelmann oak known to occur within the Phase 2 study area are not expected to be affected by the Project.

Pre-construction surveys will identify any new locations and implement measures necessary to minimize impacts to special-status plant species consistent with MM BR-2, as applicable. Vehicles and equipment will follow the best management practices discussed in Project Commitment L (San Diego Ambrosia), MM BR-1 (Limit Construction to Designated Areas and Avoid Riparian, Aquatic, and Wetland Areas), and MM BR-4 (Limit Removal of Native Vegetation Communities and Trees) to avoid and reduce potential disturbance to special-status plant species. Although no oak tree impacts are anticipated, if any oak tree removal or trimming is determined necessary, it will be done in accordance with MM BR-6, including implementation of required mitigation.

Additionally, biological construction monitoring will occur where special-status plants may occur on Phase 2 (MM BR-3). Avoidance and minimization measures to further reduce impacts to special-status plant species include Project Commitment B (WEAP), MM BR-9 (Invasive Plant Control Measures), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

FAIRY SHRIMP SURVEYS

Phase 2 focused protocol-level fairy shrimp surveys were conducted within suitable habitat for a total of seven wet seasons between 2008 and 2018. Surveys were conducted by AMEC in 2008/2009, 2009/2010, 2011/2012, 2012/2013, and 2013/2014; by EI, Rincon Consultants, and Cooper Biological in 2016/2017; and by EI and Cooper Biological in 2017/2018.

Methods

Phase 2 wet season fairy shrimp surveys were conducted in accordance with the U.S. Fish and Wildlife Service (USFWS) 2015 *Interim Survey Guidelines to Permittees for Recovery Permits under Section 10(a)(1)(A) of the Endangered Species Act for the Listed Vernal Pool Branchiopods*. Per the guidelines, all depressions that held water and had potential to support listed vernal pool branchiopods species were mapped during surveys conducted for the VIG Project.

For the purposes of the focused fairy shrimp surveys, once the pools were inundated with at least 3 centimeters of water following a storm event, sampling was started within 8 days of reaching the criterion, and pools were sampled once every 2 weeks until the pools were no longer inundated (or until they experienced 120 days of continuous inundation). The depressions were initially scanned for presence of detectable invertebrates prior to physical sampling, then subsequently sampled throughout the water column following USFWS protocol guidelines. Depressions were sampled using a dip net with mesh size smaller than 3.2 millimeters. In cases where the pools dried and then refilled in the same wet season, pool sampling was repeated as described above every time they reached the 3 centimeters minimum of standing water criterion. Each seasonal depression was photographed and mapped, and at each subsequent visit, specific depression data and weather conditions were recorded.

Results

During focused, botanical surveys and protocol-level fairy shrimp surveys conducted in 2016/2017 and 2017/2018, topographic features that facilitate the temporary ponding of rainfall and are known to support vernal pool indicator species were mapped and surveyed to the extent practical. Due to the inaccessibility of several private properties, and because much of these areas are subject to frequent and repeated disturbances (i.e., annual disking/tilling), collection of vernal pool data in these areas was not feasible.

In 2017, two seasonally ponded areas with vernal pool indicator species were observed along Baker Street near Structures 401-403 (just south of Pierce Street; Map Pages 5 and 6), and one large pond was observed in a Riverside County conservation area at the intersection of Alberhill Ranch Road and Nichols Road near Structure 436 (Map Page 7). No impacts to the Riverside County conservation area feature are anticipated, as this feature is well outside the proposed impact areas. The vernal pools observed north and south of Baker Street are located outside the proposed impact areas and will therefore be avoided entirely during construction.

No federally-listed fairy shrimp species were observed within Segments 4-8 during wet season sampling; however, the common versatile fairy shrimp (*Branchinecta lindahli*) was observed present in many of the pools and depressions. Although dry season surveys were not conducted according to current survey guidelines, the Project site has been thoroughly evaluated during the four wet season surveys, which included several years of adequate rainfall, and provided consistent negative results.

Conclusions

No protected (listed) fairy shrimp species were detected within Phase 2 during the surveys. Therefore, no impacts to listed fairy shrimp species are expected to occur as a result of constructing Phase 2.

Construction work areas were designed to avoid all vernal pools. Avoidance and minimization measures to further reduce impacts to listed fairy shrimp species include implementation of Project Commitment B (WEAP), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-4 (Limit Removal of Native Vegetation Communities and Trees), MM BR-9 (Invasive Plant Control Measures), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

BURROWING OWL SURVEYS

Regarding Phase 2, a general habitat assessment for burrowing owl (BUOW; *Athene cunicularia*) was conducted by AMEC in 2006. Protocol-level focused surveys were conducted by AMEC in 2007, 2010, and 2011; by AMEC and Chambers Group in 2012; by AMEC and Pangea in 2013; by Pangea in 2014; by Kidd Biological in 2015; and by EI in 2017 and 2018.

Methods

BUOW habitat assessments and focused surveys were conducted according to the *Burrowing Owl Consortium Guidelines* (CDFG 1993), the *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area* (County of Riverside 2006), and the *Staff Report on Burrowing Owl Mitigation* (CDFG 2012). Data were collected by numerous techniques including the use of a hand-held GPS device, standardized data forms, photographs, and aerial field maps. Four surveys were conducted as follows: 1) at least one between February 15 and April 15, and 2) a minimum of three survey visits, at least three weeks apart, between April 15 and July 15, with at least one visit after June 15 (CDFG 2012). Potential habitat within the Project area was assessed for BUOW presence, use, and potential use. Areas with potential BUOW habitat, including grasslands, sage scrub, and other areas with sparse, low growing vegetation, were surveyed for potential burrows and BUOW. These surveys included California ground squirrel (*Otospermophilus beecheyi*) and ground squirrel burrow surveys. Biologists walked areas of potential habitat while searching for BUOW, potential and active burrows, and owl sign, such as feathers, pellets, and prey items. The survey area included a 150-meter (500-foot) buffer zone on either side of the centerline.

Focused BUOW surveys, conducted in areas where suitable burrows were found during the focused burrow surveys, consisted of eight site visits covering all Project areas four times. Surveys were conducted in the morning 1 hour before sunrise to 2 hours after sunrise. Upon arrival at the survey area and prior to initiating the walking surveys, surveyors used binoculars and/or spotting scopes to scan all suitable habitats, location of mapped burrows, owl sign, and owls, including perch locations to ascertain owl presence. A survey for owls and owl sign was then conducted by walking through suitable habitat over the entire Project site and within the adjacent 150-meter (500-foot) buffer zone on either side of the center line. These pedestrian surveys followed transects spaced to allow 100 percent visual coverage of the ground surface. The distance

between transect center lines were no more than 20 meters (66 feet) and were reduced to account for differences in terrain, vegetation density, and ground surface visibility. In areas where access was not obtained, the area adjacent to the Project site was surveyed using binoculars and/or spotting scopes to determine if owls are present in areas adjacent to the Project site.

Results

Although many burrows suitable for BUOW and suitable habitat were identified, no BUOWs, active burrows, or BUOW sign were observed within the Project study area on Phase 2.

Conclusions

In accordance with MM BR-12, pre-construction surveys for BUOW will be conducted within 30 days of construction during the non-breeding season (September 1 through January 31) and within 14 days of construction during the breeding season (February 1 through August 31) to confirm whether BUOW occupy the site. If an occupied burrow is identified, buffer distances detailed in the Staff Report on Burrowing Owl Mitigation (CDFG 2012) shall be adhered to. Additionally, biological construction monitoring will occur during initial ground disturbance within Phase 2.

If appropriate buffers cannot be maintained, and impacts on BUOW or occupied burrows are unavoidable, a Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared and implemented in compliance with MSHCP Section 6.3.2, and as approved by CDFW and Regional Conservation Authority (RCA). If it is determined that project activities require removal of occupied burrows, eviction and burrow closure may be required in consultation with CDFW to ensure against "take" of owls or nests. However, this will only occur after the preparation of a Burrowing Owl Exclusion Plan, as approved by CDFW.

Avoidance and minimization measures to further reduce impacts to BUOW include implementation of Project Commitment B (WEAP), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-4 (Limit Removal of Native Vegetation Communities and Trees), MM BR-5 (California gnatcatcher protection measures), MM BR-9 (Invasive Plant Control Measures), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

CALIFORNIA GNATCATCHER

Coastal California gnatcatcher (*Polioptila californica californica*; CAGN) is a Covered Species in the MSHCP and is Adequately Conserved. Therefore, no focused surveys for CAGN were conducted.

Results

During general and other project-related biological resources surveys, CAGN has been detected on Phase 2 in areas of suitable habitat, particularly Riversidean sage scrub (RSS)/disturbed Riversidean sage scrub (DRSS; refer to Map Pages 3, 4, 6, 7, 12, and 13).

Conclusions

Because no focused surveys have been conducted for CAGN within the Project area, any sage scrub within the Criteria Area, if determined suitable by a qualified biological monitor, will be assumed occupied. In accordance with the MSHCP and MM BR-5 (California gnatcatcher protection measures), removal of RSS/DRSS habitat will not occur during the CAGN breeding season (February 15 through August 15). Vegetation clearing will be limited to the non-breeding season only.

If an active CAGN nest is observed during pre-construction surveys, a qualified avian biologist will establish a 500-foot buffer around the nest and no activities will be allowed within the buffer until the young have fledged and are no longer reliant on the nest. Vehicles and equipment will follow the best management practices discussed in MM BR-4 (Limit Removal of Native Vegetation Communities and Trees) and the VIG Nesting Bird Management Plan (NBMP) to avoid potential disturbance to CAGN. Additionally, biological construction monitoring will occur during initial work within the staging yards.

Avoidance and minimization measures to further reduce impacts to CAGN include implementation of Project Commitment B (WEAP), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-9 (Invasive Plant Control Measures), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

RIPARIAN BIRDS

Within Phase 2, focused surveys for special-status riparian birds, including least Bell's vireo (*Vireo bellii pusillus*; LBVI), southwestern willow flycatcher (*Empidonax traillii extimus*; SWFL), and yellow-billed cuckoo (*Coccyzus americanus*; YBCU) were conducted by AMEC in 2007, 2010, 2011, 2012, 2013, and 2014; by Kidd Biological in 2015; and by Cooper Biological in 2017 and 2018.

Methods

Phase 2 focused surveys for LBVI, SWFL, and YBCU were conducted in accordance with the currently accepted survey protocols by USGS and USFWS permitted ornithologists.

The LBVI protocol requires at least eight surveys to be conducted between April 10 and July 31 (USFWS 2001). The SWFL protocol requires five surveys, and that the first survey be performed between May 15 and May 31, the second between June 1 and June 21, and that three visits be conducted between June 22 and July 17 (Sogge et al. 1997). The survey protocol for YBCU (Halterman et al. 2016) requires a total of four surveys during the breeding season in suitable habitat. The surveys must be completed at specific intervals within the season that includes one survey between June 15 and June 30, two surveys between July 1 and July 31, and one survey between August 1 and August 15, spaced 12-15 days apart.

The surveys consisted of slowly moving through each suitable habitat while listening for the songs and calls of the three target species (LBVI, SWFL, and YBCU). During the surveys performed for the SWFL and YBCU, taped recordings of their vocalizations were broadcast, a method consistent with the protocols. During the SWFL surveys, recordings of their vocalizations were broadcast every 20-30 meters, as required by protocol. During YBCU surveys, territorial calls ("Kowlp" calls) were broadcast every 100 meters, with the calls being repeated five times at one-minute intervals.

Results

Several riparian areas were identified with suitable habitat for LBVI, SWFL, and YBCU within Phase 2. These habitats generally occur along Temescal Creek and its larger tributaries. No YBCU were detected during any of the surveys conducted between 2006 and 2018.

During focused LBVI surveys conducted between 2007 and 2014, only singing males were detected and breeding success was not determined. In 2015, a total of eight territories were occupied by pairs, and four solitary males were observed in separate territories within the Project study area. In 2017, a total of 22 territories were documented, 12 were occupied by paired individuals (four were located just outside the survey area). Three pairs had a documented nest and evidence of successful breeding (i.e., fledgling[s] observed). In 2018, a total of 28 territories were documented, 16 were occupied by paired individuals (four were located just outside the survey area). Ten of these pairs had evidence of successful breeding. Refer to Map Pages 2 through 5, 8 through 14, and 18 through 19 for LBVI occurrences documented in Phase 2.

In 2015, surveys detected SWFL (solitary males) at two locations (Map Pages 4 and 17), and in 2007, four willow flycatchers of the more northerly subspecies (WIFL; *Empidonax trallii*; California Species of Concern) were detected in the Project area. In 2010 and 2011, one vocal WIFL was also detected, and in 2014, several WIFL were observed. In 2017, one WIFL (possibly the little willow flycatcher [*E. t. brewsteri*], which is also listed as endangered in California), was observed migrating through the Project area. Refer to Map Pages 4, 8, 10, 13, 14, and 17 for WIFL occurrences documented in Phase 2.

Impacts to LBVI occupied and potentially occupied habitat will be avoided to the greatest extent possible. Construction activities, including minimal tree trimming, will be conducted outside of the LBVI breeding season (generally 1 March through 31 August). Off-site mitigation proposed along Temescal Wash (i.e.,

Wyroc/Lake Street) is intended to ensure preservation of habitat for species such as LBVI. As such, the Project is consistent with MSHCP Section 6.1.2.

Conclusions

LBVI occupied habitat mapped throughout Phase 2 will be afforded a 500-foot avoidance buffer during the LBVI breeding season (generally March 1 through August 31) to minimize impacts to nesting birds. Construction activities in or within 500 feet of occupied habitat, including minimal tree trimming, will be conducted outside of the LBVI breeding season.

Avoidance and minimization measures to further reduce impacts to special-status riparian birds include implementation of Project Commitment B (WEAP), Project Commitment D (Habitat Restoration and Revegetation Plan), MM BR-1 (Limit Construction to Designated Areas and Avoid Riparian, Aquatic, and Wetland Areas), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-4 (Limit Removal of Native Vegetation Communities and Trees), MM BR-7 (Habitat Restoration and Revegetation Plan Requirements), MM BR-9 (Invasive Plant Control Measures), MM BR-11 (Migratory Birds and Raptors Impact Reduction Measures), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

STEPHENS' KANGAROO RAT

Surveys for Stephens' Kangaroo Rat (*Dipodomys stephensi*; SKR) were conducted within Phase 2 in suitable habitat in 2010 and 2011 by AMEC.

Methods

Within Phase 2, habitat assessments and focused surveys were conducted following standard trapping protocol for SKR. Standard methods typically include examining aerial images to locate suitable habitat, followed up by field visits to identify the most promising trapping sites for SKR, installing and baiting traps, checking traps at midnight and dawn, and upon identification of captured individuals, releasing them unharmed at their capture sites.

Results

SKR individuals and associated burrows were identified within the Phase 2 study area (Maps Pages 5, 6, 7, 11, 14, and 15).

Conclusions

It should be noted that per the MSHCP Implementing Agreement, SCE understands that "take" for SKR is not available through the MSHCP as the proposed Project also lies within the SKR Habitat Conservation Plan (HCP) boundaries. As of October 15, 2012, SCE finalized an SKR HCP Implementation Agreement with the Riverside County Habitat Conservation Agency. This Agreement provides a process through which SCE may obtain take authorization of SKR through the SKR HCP. This take authorization is in accordance with the terms and conditions in the USFWS Management Authorization (or USFWS' Federal Permit), the SKR HCP, and the SKR HCP Implementation Agreement. To complete the SKR take authorization process prior to the start of construction, SCE will obtain a Certificate of Inclusion from the Riverside County Habitat Conservation Authority (RCHCA) specific to the VIG Project.

Avoidance and minimization measures to further reduce impacts to SKR include implementation of Project Commitment B (WEAP), Project Commitment N (Wildlife Movement), MM BR-2 (Pre-construction Surveys), MM BR-3 (Biological Monitoring During Construction), MM BR-4 (Limit Removal of Native Vegetation Communities and Trees), MM BR-5 (California gnatcatcher protection measures), MM BR-9 (Invasive Plant Control Measures), MM BR-10 (Prevent Wildlife Entrapment), MM BR-13 (Trash Abatement), and MM BR-15 (SWPPP).

ADDITIONAL SURVEYS COMPLETED FOR THE CONCORDIA YARD

A habitat assessment was conducted on the northern portion of the Concordia Yard that was not included in the VIG Project Final Environmental Impact Report (FEIR).

HABITAT ASSESSMENT

A habitat assessment survey was conducted on December 10, 2019, by EI to document protected waters, bird nests, special-status plants and wildlife and potential habitat for special-status species.

Methods

A general habitat assessment, BUOW focused burrow survey, and formal jurisdictional delineation were performed by EI qualified biologists Mitch Provance and Joshua Zinn on December 10, 2019. The Concordia Yard survey area included the proposed Concordia Yard and a 500-foot buffer. The survey area only included northern areas that had not been previously surveyed for Phase 2 between 2006 and 2018 (Exhibit 2). The habitat assessment/burrow survey was conducted by walking meandering transects no more than 30 meters apart throughout the Concordia Yard survey area to document existing site conditions, to identify all potential natural and surrogate potential BUOW burrows/crevices and map vegetation communities. A jurisdictional delineation documented features that are potentially MSHCP Riparian/Riverine resources and/or are jurisdictional to the regulatory authorities. The methods used for these BUOW surveys and jurisdictional delineation followed the same methods detailed above in the Previously Completed Surveys section. Wildlife and plant species were recorded, including areas that provide suitable habitat (e.g., vegetation communities, rocky outcrops, burrow complexes, drainages, etc.) for any special-status plant and wildlife species. All special-status biological resources were documented if observed. Binoculars were used to scan for biological resources outside the buffer and in any inaccessible areas. This assessment was conducted outside the optimal flowering period for some special-status annual plant species found in the region; however, many plants are often still recognizable by biologists proficient in identifying these species. Vegetation communities and all encountered sensitive biological resources were documented in the field using Collector for ArcGIS connected to an external receiver via Bluetooth, with accuracy to 3 meters.

Results

The Concordia Yard consists of relatively flat (less than 4% slope), previously graded and disked land dominated by bare ground and gravel, with widely scattered annual weedy species and refuse debris, and a concrete pad, best described as heavily disturbed with evidence of previous development. Plants observed within the Concordia Yard included recently germinated fiddleneck (*Amsinckia* sp.), cheeseweed mallow (*Malva parviflora*), Mediterranean grass (*Schismus* sp.), brome grass (*Bromus* sp.), short-podded mustard (*Hirschfeldia incana*), stinknet (*Oncosiphon piluliferum*), white horehound (*Marrubium vulgare*), tumble mustard (*Sisymbrium* sp.), and horseweed (*Erigeron* sp.).

West of the Concordia Yard, an ephemeral wash that conveys flows generally north to south consists of Riversidean alluvial fan sage scrub (RAFS; State Rarity: S3) dominated by scale broom (*Lepidospartum squamatum*), with California cholla (*Cylindropuntia californica*), white sage (*Salvia apiana*), tarragon (*Artemisia dracunculus*), spiny redberry (*Rhamnus crocea*), brittlebush (*Encelia farinosa*), Coulter's Matilija poppy, and linear leaved stillingia (*Stillingia linearfolia*). West of the Concordia Yard and the furthest extents of the buffer to the north and east consist of RSS dominated by brittlebush and California buckwheat (*Eriogonum fasciculatum*), with white sage, stinknet, California matchweed (*Guttierrzia californica*), short-podded mustard, and brome grass. The area within the survey buffer directly north and east of the Concordia Yard consists of DRSS dominated by brittlebush and linear leaved stillingia, with short-podded mustard, brome grass, dove weed (*Croton setiger*), and a few individuals of sweetbush (*Bebbia juncea*).

Wildlife observed included common species such as California towhee (*Melozone crissalis*), common raven (*Corvus corax*), mourning dove (*Zenaida macroura*), red-tailed hawk (*Buteo jamaicensis*), western kingbird (*Tyrannus verticalis*), and desert cottontail (*Sylvilagus audubonii*). No small rodent or suitable BUOW burrows were observed. No ponding or potential fairy shrimp habitat was observed. No nests were observed.

The Concordia Yard does not provide suitable habitat for any rare plant likely to occur in the region due to the lack of appropriate soils, topography, or hydrology and highly disturbed condition of the site. Coulter's

matilija poppy (CRPR 4.2) was observed 75 feet east of the Concordia Yard in the ephemeral wash containing RAFS. No other special-status plant species were detected within 500 feet of the Concordia Yard.

One jurisdictional MSHCP Riparian/Riverine resource was mapped adjacent to the Concordia Yard. This resource is the northern extension of the wash previously mapped by EI in late-summer/early-fall of 2018 during a jurisdictional delineation. The limits by jurisdiction of this feature were updated during the December 2019 site visit. The unnamed drainage, observed east and entirely outside of the Concordia Yard, conveys flows generally north to south, contains RAFS vegetation, and was dry during the assessment.

SKR is likely to occur within suitable habitat surrounding the Concordia Yard, but is unlikely to occur within the yard as no habitat is present.

BUOW is not expected to occur within the Concordia Yard as no individuals or burrows suitable to support BUOW were observed during the habitat assessment and focused BUOW burrow survey conducted by EI on December 10, 2019. Surrounding areas consisting of DRSS north of the yard, RSS to the west, and RAFS to the east provides potential foraging habitat; however, there is no breeding habitat as no suitable burrows or individuals of California ground squirrel were observed during the survey.

No suitable habitat for special-status riparian birds was observed within 500 feet of the Concordia Yard or in the yard itself. RSS west of the yard and DRSS to the north provides marginal suitable habitat for CAGN however, no individuals of CAGN were detected during the habitat assessment and habitat is not present within the yard.

Within and surrounding the Concordia Yard, no vernal pools and/or other differentially saturated areas with the potential to support fairy shrimp were present. Therefore, no impacts to listed fairy shrimp species are expected as a result of using the Concordia Yard for staging approved materials and equipment for the duration of the project.

Conclusions

Species-specific surveys are required for projects occurring within an MSHCP-designated Survey Area if species-specific habitat conditions are present within the project area. The proposed Concordia Yard is located within the MSHCP Criteria Area Species Survey Area (CASSA), Narrow Endemic Plant Species Survey Area (NEPSSA), and Burrowing Owl Survey Area. However, because no suitable habitat for Criteria Area Species and Narrow Endemic Species with the potential to occur within the vicinity is present within the Concordia Yard, focused surveys are not recommended. No state- or federally listed plant or wildlife species were observed or are expected to occur. One CNPS-listed plant, Coulter's matilija poppy, was observed east and well outside of the Concordia Yard, but no habitat for rare plants exists on the Concordia Yard. Marginally suitable habitat for CAGN is present north and west of the Concordia Yard. No nests or nesting activities were observed during the survey. Nonetheless, pre-construction surveys will identify any new special-status species locations and measures will be implemented as necessary to minimize impacts consistent with Project Commitments and mitigation measures listed above for each species. Pre-construction surveys for special-status plant and wildlife species will be completed within two weeks of the start of construction in any given project construction area, and again if work has lapsed for longer than 30 days. Pre-construction surveys for BUOW will be conducted by a qualified biologist within 30 days of construction during the non-breeding season and within 14 days of construction during the breeding season (February 1 through August 31) to confirm whether burrowing owls occupy the site.

REMAINING PRE-CONSTRUCTION SURVEYS

Prior to the start of construction at each specific work location, pre-construction surveys will be conducted to determine the presence of special status plants, noxious weeds, and all wildlife species for the purpose of preventing direct loss of vegetation and wildlife and the spread of noxious plant species. Pre-construction surveys will be performed according to the following guidelines:

- MM BR-2: Pre-construction Surveys

- Survey area – Pre-construction surveys for special-status plant and wildlife species, and invasive plants/noxious weeds shall include all disturbance areas where potential biological resources could be located, including all Structure Work Areas, Pull Sites, Staging Areas, Access Roads, etc. Pre-construction surveys will also document the composition of the vegetation communities within work areas to establish baseline conditions prior to construction and to guide post-construction restoration efforts.
- Timing – Pre-construction surveys shall be completed within two weeks of the start of construction in any given project construction area, and again if work has lapsed for longer than 30 days.
- Reporting – Special-status species and other protected biological resources observed during pre-construction surveys shall be documented by biologists in the SCE Field Reporting Environmental Database (FRED). Appropriate disturbance-free buffers will be established in the field.

- MM BR-12: Burrowing Owl Impact Reduction Measures
  - Survey area – Pre-construction surveys for BOUW shall be performed throughout the project areas that contain suitable BUOW habitat with a potential to be affected by construction activities, plus an additional area extending 300 feet from the Projects' boundaries.
  - Timing – Pre-construction surveys for BUOW will be conducted by a qualified biologist within 30 days of construction during the non-breeding season and within 14 days of construction during the breeding season (February 1 through August 31) to confirm whether burrowing owls occupy the site.
  - Reporting – Special-status species and other protected biological resources observed during pre-construction surveys shall be documented by biologists in FRED. If an occupied burrow is identified, buffer distances detailed in the Staff Report on Burrowing Owl Mitigation (CDFG 2012) shall be adhered to.
    - If appropriate buffers cannot be maintained, and impacts on BUOW or occupied burrows are unavoidable, a DBESP shall be prepared and implemented in compliance with MSHCP Section 6.3.2, and as approved by CDFW and RCA. If, in consultation with CDFW it is determined that project activities require removal of occupied burrows, eviction and burrow closure may be required to prevent "take" of owls or nests. However, this will only occur after the preparation of a CDFW-approved Burrowing Owl Exclusion Plan.

REPORTING

All field observations and data will be reported using a web-based database system, FRED. This system has been verified, tested, and used to successfully monitor the regulatory compliance of large-scale projects. FRED will organize and track the resources throughout the VIG Project, and allow secure web access to continuously update field observation data and reporting functions to project compliance staff and agencies. Regular reporting will be established and generated via FRED and include pre-construction survey reports, daily monitoring reports, and weekly and monthly summary reports.

WORKER ENVIRONMENTAL AWARENESS PROGRAM

In accordance with Project Commitment B, SCE has prepared and will implement a WEAP for the VIG Project. Construction crews and contractors will be required to participate in the WEAP training prior to starting work on the VIG Project. SCE will provide the WEAP training to communicate VIG's environmental concerns, including a discussion of the special-status species and other protected resources that could exist in the VIG Project area and vicinity, all related mitigation measures, and the appropriate work practices necessary to protect resources that may be encountered during the course of the VIG Project.

RESTORATION AND INCIDENTAL TAKE PERMIT

In accordance with Project Commitment D, MM BR-4, MM BR-6, MM BR-7, and MM BR-8, all temporary impacts will be restored to pre-construction conditions or better. Restoration will follow an approved Habitat Restoration and Revegetation Plan (HRRP; MM BR-7). Temporary impacts to MSHCP Public/Quasi Public conserved lands and Additional Reserve Lands will be restored and mitigated per an approved HRRP, although no impacts to these conserved lands are anticipated for Phase 1. If any oak tree removal or trimming is determined necessary, it will be done in accordance with MM BR-6, including implementation of required mitigation.

The Phase 2 Participating Special Entity (PSE) application is currently under RCA review. The Phase 2 Certificate of Inclusion (COI) is expected in 2020.

CONSTRUCTION MONITORING

In accordance with MM BR-3, a qualified biological monitor will be present during construction activities. Once initial ground disturbance is complete, monitoring will occur periodically during all construction activities. Daily monitoring reports, as well as any special-status plants or wildlife species, breeding birds, or incidents that are observed during daily monitoring, will be documented in FRED.

The monitor will have the authority to temporarily stop work that he or she determines to be threatening to a special-status plant or wildlife species or nesting bird. The monitor will determine the appropriate action, and work will resume once the monitor determines there is no longer a threat to the special-status species or approval has been obtained from the appropriate wildlife agencies or CPUC.

Cultural Resources Review

May 8, 2020

Matt Hooge
Senior Environmental Manager
Wilson Construction Company
1190 NW 3rd Avenue
Canby, OR 97013
E: mhooge@wilsonconst.com

RE: Cultural Resources Notice to Proceed Request #2 for the Concordia Yard and Added Workstations for the Southern California Edison Valley Ivyglen Subtransmission Line Project, Riverside County, California

Southern California Edison Company (SCE) is proposing construction of the Valley-Ivyglen (VIG) 115 Kilovolt (kV) Subtransmission Line Project (Project), which entails a new, single circuit 115-kV subtransmission line to connect the existing Valley Substation (in Menifee, California) to the existing Ivyglen Substation (near Lake Elsinore, California) in western Riverside County. Paleo Solutions, Inc. (Paleo Solutions) has been contracted by Wilson Construction Company (Wilson) to complete field surveys and inventories of new Project areas and amend the Cultural Resources Monitoring and Treatment Plan (CRMTP) to reflect the current Project design and results of new surveys.

This memorandum summarizes the results of the cultural resources investigations conducted to date and includes an analysis of the proposed use of the Concordia Yard and added workstations along Segments VIG4 through VIG8. This memorandum was completed in accordance with the California Environmental Quality Act (CEQA), the stipulations and Mitigation Measures (MMs) included in the Cultural Resources section of the Project's Final Environmental Impact Report (FEIR) (Ecology and Environment, Inc. [E & E] 2017 and E & E 2018), and the CRMTP (Chandler and Denniston 2020).

1.0 PROJECT LOCATION AND DESCRIPTION

The Valley-Ivyglen Project spans from the existing Valley Substation in the City of Menifee to the existing Ivyglen Substation to the west (Attachment A: Figure A-1). The Project consists of eight segments (VIG1 through VIG8) and will be constructed in two phases: Phase 1 consists of Segments VIG1, VIG2, and VIG3 (approximately 13.1 miles) and Phase 2 consisting of Segments VIG4 through VIG8 (approximately 11.5 miles). The Valley-Ivyglen Project crosses Interstate 215 (I-215), State Route 74 (SR-74), and Interstate 15 (I-15). Fiber optic lines will be installed overhead on the proposed structures and underground in new and existing conduits.

The Valley-Ivyglen Project will involve:

- Construction of a new, single-circuit 115-kV subtransmission line and fiber optic line.
- Installation of overhead fiber optic lines on the proposed structures and underground in new (approximately 5,400 feet) and existing (approximately 13,200 feet) conduit.

- Transfer of existing distribution circuits along portions of the proposed subtransmission line to new 115-kV structures or to underground positions.
- Installation of new 115-kV switching and protective equipment at Valley and Ivyglen substations.

The current Notice to Proceed Request (NTPR) #2 covers the Concordia Yard and added work areas along Segments VIG4 through VIG8 (Phase 2). Segments VIG1, VIG2, and VIG3 (Phase 1) were captured under NTPR #1 (Chandler 2020a).

Segment VIG4
This segment will extend along Third Street from Collier Avenue southwest to Pasadena Avenue and then follow Pasadena Avenue northwest until the road ends. From there, it will pass over land to Riverside Drive (SR-74), extend southwest to Baker Street, and then follow Baker Street northwest to Pierce Street. It will pass under the Valley–Elsinore–Fogarty 115-kV line as it approaches Pierce Street. Segment VIG4 will follow an existing distribution line right-of-way (ROW), and in these areas, the existing distribution line will be relocated to an overhead position on a lower section of the new 115-kV structures. Guy poles will be installed in locations where the proposed 115-kV structures require additional support.

Segment VIG5
This segment will continue from Pierce Street across Nichols Road and then extend west along Nichols Road to the abandoned section of Lake Street ("Old Lake Street"). It will extend northwest along Old Lake Street toward I-15. Segment VIG5 will continue parallel to Lake Street to the I-15 on- and off-ramps. The segment will turn west along an I-15 off-ramp and then along both sides of Temescal Canyon Road for approximately 0.3 miles. From there, it will cross I-15 to the north and then continue west along Concordia Ranch Road to the proposed Alberhill Substation site. A number of guy poles will be installed in locations where the proposed 115-kV structures require additional support. VIG5 will follow existing distribution line ROWs, and in these areas, the existing distribution line will be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG6
This segment will continue along Temescal Canyon Road west to Hostettler Road from where Segment VIG5 crosses I-15. From there, it will extend over land northwest along I-15. Sections of Segment VIG6 will follow an existing distribution line ROW or the 115-kV ROW. The existing distribution line will be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG7
This segment will cross Horse Thief Canyon Road and continue along De Palma Road for approximately 1.2 miles. From there, it will cross I-15 to the north and extend to Temescal Canyon Road. It will continue northwest on Temescal Canyon Road to a point approximately 700 hundred feet northwest of the intersection of Temescal Canyon Road and Indian Truck Trail. The existing single-circuit 115-kV structures will be replaced with double-circuit 115-kV structures. Sections of Segment VIG7 will follow existing distribution line ROWs, and the existing overhead distribution line will be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG8
Along 115-kV Segment VIG8, the fiber optic line will primarily be installed underground along this segment. Approximately 10,670 feet of fiber optic cable will be installed in an existing underground conduit along Campbell Ranch Road, beginning approximately 850 feet east of Santiago Canyon Road, to Ivyglen Substation. An additional approximately 1,497 feet of fiber optic cable will be installed in a new underground conduit along Temescal Canyon Road from Campbell Ranch Road to Ivyglen Substation.

Concordia Yard

The Concordia Yard is a previously graded area located off of Concordia Ranch Road and Black Powder Road at the western portion of the VIG Project alignment (see Attachment A: Figure A-2). The yard will be used for material staging and will be enclosed with a fence. Wilson will use equipment to spread 3 inches of gravel over the surface of the yard and to auger holes to install perimeter fencing. At the end of the Project, front-end loaders and other equipment will be used to remove the gravel. Ground disturbance in native sediments within the Concordia Yard will be limited to augering 12-inch diameter holes.

Workstations

Construction work within the workstations include the placement of additional pole structures and the installation of guy anchors. This will require ground-disturbing activities at each workstation. The Concordia Yard and added work locations are depicted in Attachment A: Figures A-3 through A-31.

2.0 CULTURAL RESOURCES INVESTIGATION

The Study Area for cultural resources is defined as all areas that will be subject to ground disturbing activity associated with development of the proposed Project, along with a 100-foot buffer. The Study Area for cultural resources includes all proposed tower locations, access roads and ROWs, staging yards, pull sites, subtransmission lines, telecommunications lines, and underground trenching. For Segments VIG4 through VIG8, the Study Area extends approximately 11.5 miles in length.

The original cultural resource survey was completed in 2006 by Lerch and Gray. This initial survey covered the preferred route for the proposed Project, seven alternative route segments, and a 133-acre area adjacent to the preferred route. Additional surveys were conducted to cover new or modified elements of the proposed project (Pollock n.d., Chmiel and Cooley 2008, Craft and Cooley 2008, Wilson and Eckhardt 2009, Brodie 2011a, Brodie 2011b, Brodie 2011c, Glentis 2011a, Glentis 2011b, Brodie 2012, McLean and Brodie 2012, Miller 2013, Wilson and Gibson 2013, Millington and Elzinga, 2015, Chandler 2020a, and Chandler 2020b). One cultural resources inventory encompassing the Concordia Yard was completed in 2020 with negative results (Chandler 2020c).

Of the added Project locations along VIG4 through VIG8, 12 work areas totaling 0.62 acre, were not included in previous investigations (Attachment A: Figures A-32 to A-35). As part of the current assessment, a field survey of the 0.62-acre was conducted by Paleo Solutions archaeologist, Liz Denniston on May 5, 2020 (Denniston 2020). Accessible portions of the work locations were surveyed using transect intervals spaced 10 meters apart. Surveyed areas were closely inspected for evidence of prehistoric or historic-age archaeological materials and historic-age structures or features.

3.0 RESULTS AND RECOMMENDATIONS

A cultural resources assessment encompassing the Concordia Yard was completed in 2020 with negative results (Chandler 2020c). The Concordia Yard has been previously disturbed, and ground disturbance in native sediments will be limited to augering 12-inch diameter holes around the perimeter of the Yard for the installation of fencing. No cultural resources have been identified within the yard. As a result, fencing and use of the yard will not results in any impacts to cultural resources. Therefore, there will be no impacts to cultural resources from use of the yard.

As a result of the 2006 to 2020 investigations along the Project alignment, a total of 18 cultural resources were identified within 100 feet of Segments VIG4 through VIG8. As a result of the 2020 investigation of the added 0.62 acre, one additional, previously-recorded resource was identified within the newly established Study Area. Of these 19 resources, 10 are recommended not eligible for the California Register of Historical

Resources (CRHR), one is located near a proposed access road but more than 100 feet from active construction, and four are built environment resources that will not be impacted by construction activities. No mitigation measures will be required for these 15 resources. Impacts may occur at the remaining four resources. To avoid inadvertent impacts to these four resources, an Environmentally Sensitive Area (ESA) will be established and archaeological and Native American spot checking or monitoring will be conducted during all construction activities within 100 feet of the resources, as outlined in the Project's CRMTP (Chandler and Denniston 2020). With implementation of these mitigation measures, use of the Concordia Yard and added work areas will not result in any significant impacts to cultural resources.

Sincerely,

Liz Denniston
Principal Archaeologist, Paleo Solutions

Paleontological Resources Review

May 12, 2020

Matt Hooge
Senior Environmental Manager
Wilson Construction Company
1190 NW 3rd Avenue
Canby, OR 97013
E: mhooge@wilsonconst.com

RE: Paleontological Resources Notice to Proceed Request #2 for the Concordia Yard and Added Workstations for the Southern California Edison Valley Ivyglen Subtransmission Line Project, Riverside County, California

Southern California Edison Company (SCE) is proposing construction of the Valley-Ivyglen (VIG) 115 Kilovolt (kV) Subtransmission Line Project (Project) which entails a new, single circuit 115-kV subtransmission line to connect the existing Valley Substation (near Perris, California) to the existing Ivyglen Substation (near Lake Elsinore, California) in western Riverside County. Paleo Solutions, Inc. (Paleo Solutions) has been contracted by Wilson Construction Company (Wilson) to complete field surveys and inventories of new Project areas and amend the Paleontological Resources Monitoring Plan (PRMP) to reflect the current project design and results of new surveys.

This paleontological memorandum summarizes the results of the paleontological resources investigations to date and includes an analysis of the proposed use of the Concordia Yard and added workstations along Segments VIG4 through VIG8. This memorandum was completed in compliance with Project Commitment B and Mitigation Measure (MM) CR-4 and MM CR-5 of the Valley-Ivyglen Project's Mitigation Monitoring, Compliance, and Reporting Plan (MMCRP; Ecology and Environment, Inc., 2017 and 2018); California Environmental Quality Act (CEQA), Riverside County, City of Menifee, City of Perris, City of Lake Elsinore, and Society of Vertebrate Paleontology (SVP) (SVP, 2010) guidelines; best practices in mitigation paleontology (Murphey et al., 2019), and stipulations of the PRMP (Paleo Solutions, 2020).

1.0 PROJECT LOCATION AND DESCRIPTION

The Valley-Ivyglen Project spans from the existing Valley Substation in the City of Menifee to the existing Ivyglen Substation to the west (Attachment A: Figure 1). The Project consists of eight segments (VIG1 through VIG8) and would be constructed in two phases: Phase 1 consists of Segments VIG1, VIG2, and VIG3 (approximately 13.1 miles) and Phase 2 consisting of Segments VIG4 through VIG8 (approximately 11.5 miles). The Valley-Ivyglen Project crosses Interstate 215 (I-215), State Route 74 (SR-74), and Interstate 15 (I-15). Fiber optic lines would be installed overhead on the proposed structures and underground in new and existing conduits.

The Valley-Ivyglen Project would involve:

- Construction of a new, single-circuit 115-kV subtransmission line and fiber optic line.

- Installation of overhead fiber optic lines on the proposed structures and underground in new (approximately 5,400 feet) and existing (approximately 13,200 feet) conduit.
- Transfer of existing distribution circuits along portions of the proposed subtransmission line to new 115-kV structures or to underground positions.
- Installation of new 115-kV switching and protective equipment at Valley and Ivyglen substations.

The current Notice to Proceed Request (NTPR) #2 covers the Concordia Yard and added work areas along Segments VIG4 through VIG8 (Phase 2). Segments VIG1, VIG2, and VIG3 (Phase 1), as well as the Valley Yard, were captured under NTPR #1 (see Richards, 2020a).

Segment VIG4

This segment would continue along Third Street from Collier Avenue southwest to Pasadena Avenue and then follow Pasadena Avenue northwest until the road ends. From there, it would pass over land to Riverside Drive (SR-74), extend southwest to Baker Street, and then follow Baker Street northwest to Pierce Street. It would pass under the Valley–Elsinore–Fogarty 115-kV line as it approaches Pierce Street. Segment VIG4 would follow an existing distribution line right-of-way (ROW), and in these areas, the existing distribution line would be relocated to an overhead position on a lower section of the new 115-kV structures. Guy poles would be installed in locations where the proposed 115-kV structures require additional support.

Segment VIG5

This segment would continue from Pierce Street across Nichols Road and then extend west along Nichols Road to the abandoned section of Lake Street ("Old Lake Street"). It would extend northwest along Old Lake Street toward I-15. Segment VIG5 would continue parallel to Lake Street to the I-15 on- and off-ramps. The segment would turn west along an I-15 off-ramp and then along both sides of Temescal Canyon Road for approximately 0.3 miles. From there, it would cross I-15 to the north and then continue west along Concordia Ranch Road to the proposed Alberhill Substation site. A number of guy poles would be installed in locations where the proposed 115-kV structures require additional support. VIG5 would follow existing distribution line ROWs, and in these areas, the existing distribution line would be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG6

This segment would continue along Temescal Canyon Road west to Hostettler Road from where Segment VIG5 crosses I-15. From there, it would extend over land northwest along I-15. Sections of Segment VIG6 would follow an existing distribution line ROW or the 115-kV ROW. The existing distribution line would be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG7

This segment would cross Horse Thief Canyon Road and continue along De Palma Road for approximately 1.2 miles. From there, it would cross I-15 to the north and extend to Temescal Canyon Road. It would continue northwest on Temescal Canyon Road to a point approximately 700 hundred feet northwest of the intersection of Temescal Canyon Road and Indian Truck Trail. The existing single-circuit 115-kV structures would be replaced with double-circuit 115-kV structures. Sections of Segment VIG7 would follow existing distribution line ROWs, and the existing overhead distribution line would be relocated to an overhead position on a lower section of the new 115-kV structures.

Segment VIG8

Along 115-kV Segment VIG8, the fiber optic line would primarily be installed underground along this segment. Approximately 10,670 feet of fiber optic cable would be installed in an existing underground conduit along Campbell Ranch Road, beginning approximately 850 feet east of Santiago Canyon Road, to

Ivyglen Substation. An additional approximately 1,497 feet of fiber optic cable would be installed in a new underground conduit along Temescal Canyon Road from Campbell Ranch Road to Ivyglen Substation.

Concordia Yard

The Concordia Yard is a previously graded area located off of Concordia Ranch Road and Black Powder Road at the western portion of the VIG Project alignment (Attachment A: Figure 1). The yard will be used for material staging and will be enclosed with a fence. Wilson will use equipment to spread 3 inches of gravel over the surface of the yard and to auger holes to install perimeter fencing. At the end of the project, front-end loaders and other equipment will be used to remove the gravel. Ground disturbance in native sediments within the Concordia Yard will be limited to augering 12-inch diameter holes.

2.0 PALEONTOLOGICAL RESOURCES STUDY AREA

The Study Area for paleontological resources is defined as all areas that would be subject to ground disturbing activity associated with development of the proposed Project. The Study Area for paleontological resources includes all proposed tower locations, access roads and ROWs, staging yards, pull sites, subtransmission lines, telecommunications lines, and underground trenching. For Segments VIG4 through VIG8 the Study Area extends approximately 11.5 miles in total length within a ROW up to 55 feet in width.

Of the added Project locations along VIG4 through VIG8, 12 work areas, totaling 0.62 acre, were not included in previous investigations. These additional components, however, lie within the half mile buffer of the original Project area and, in general, are situated within the original ROW, immediately adjacent to structure locations of the original Project area (Attachment A: Figure 2).

3.0 METHODS

A paleontological analysis was conducted for the original components along the approximately 27-mile alignment of the Valley-Ivyglen Project as part of the FEIR (Ecology and Environment, Inc., 2017). The analysis included reviews of geologic maps, literature, and several museum paleontological records searches. Subsequent analyses were conducted for the Concordia Yard, Valley Yard, and New Workstations, which were all added to the Project after the initial analysis and drafting of the Project's FEIR. Paleontological analyses of the Valley Yard and New Workstations are summarized in the NTPR1 (Richards, 2020a), and the analysis for the Concordia Yard (Richards, 2020b) is summarized in this report along with the analyses of Segments VIG4 through VIG8.

This current paleontological analysis consists of a review of geologic mapping by Morton and Miller (2006), a review of the Project's FEIR (Ecology and Environment, Inc., 2017), including the previously completed paleontological records searches and literature reviews for the Valley-Ivyglen Project (Jefferson, 1989; Lander, 2008; Scott, 2009), and a review of the previously completed paleontological records searches and literature for the nearby Valley South Subtransmission Project (McLeod, 2013; Scott, 2014).

Additionally, the results of the paleontological field survey of the Concordia Yard, conducted by Paleo Solutions staff member Daniel Nolan, B.S., on December 10, 2019, are summarized in this report.

4.0 RESULTS

4.1 Geologic Map Review

Geologic mapping by Morton and Miller (2006) indicates that VIG4 through VIG8 are underlain by late Holocene-age artificial fill (Qaf), Holocene- to late Pleistocene-age young wash deposits (Qyw), Holocene- to late Pleistocene-age young axial-channel deposits (Qya), Holocene- to late Pleistocene-age young alluvial fan deposits (Qyf), Holocene- to late Pleistocene-age young alluvial valley deposits (Qyv), late to middle Pleistocene-age old alluvial fan deposits (Qof), middle to early Pleistocene-age very old alluvial fan deposits (Qvof), middle to early Pleistocene-age very old axial-channel deposits (Qvoa), Paleocene-age Silverado Formation (Tsi), Cretaceous-age Estelle Mountain Volcanics of Herzig (1991) (Kvem), and Cretaceous-age Santigao Peak Volcanics (Kvsp), (Morton and Miller, 2006; Attachment A: Figure 3). Also mapped within the Project vicinity within the half-mile buffer are late Holocene-age very young alluvial fan deposits (Qf), late Holocene-age very young lacustrine deposits (Ql), Pleistocene-age Pauba Formation (Qpf), Cretaceous-age granite, undifferentiated (Kgu), Cretaceous-age Gavilan Ring Complex (Kgh), Triassic-age rocks of Menifee Valley, phyllite (Trmp), and Triassic-age rocks of Menifee Valley, undifferentiated (Trmu) (Morton and Miller, 2006; Attachment A: Figure 3). The Concordia Yard, which is located within VIG6, is mapped as middle to early Pleistocene-age very old axial-channel deposits (Qvoa) with minor amounts of Cretaceous-age volcanic rocks, specifically Santiago Peak Volcanics (Kvsp) (Morton and Miller, 2006; Attachment A: Figure 3).

4.2 Records Search and Literature Review

Paleontological records searches were conducted at the Natural History Museum of Los Angeles County and San Bernardino County Museum for Segments VIG3 through VIG5 and parts of VIG1, VIG2, and VIG6, as part of the Project's FEIR. The records searches, as well as paleontological literature reviews, were negative for fossil localities within the Valley-Ivyglen and Valley South Subtransmission Project areas and immediate vicinity. However, Pleistocene-age deposits similar to those within VIG4 through VIG8 and the Concordia Yard have proven to yield scientifically significant paleontological resources throughout the Inland Empire, typically from finer-grained alluvial deposits (Jefferson, 1989; Lander, 2008; McLeod, 2013; Scott, 2009, 2014). Therefore, the generally fine-grained middle to early Pleistocene-age very old axial-channel deposits (Qvoa) and Pleistocene-age Pauba Formation (Qpf) are considered to have a high potential for buried resources based on SVP (2010) guidelines, and the generally coarser-grained late to middle Pleistocene-age old alluvial fan deposits (Qof) and middle to early Pleistocene-age very old alluvial fan deposits (Qvof) have an undetermined paleontological potential until the specific lithology at a given location has been observed and evaluated. Additionally, due to the abundance of invertebrate and plant fossils recorded from Paleocene-age Silverado Formation (Tsi) (Ecology and Environment, Inc., 2017), this unit is also considered to have a high paleontological potential based on SVP (2010) guidelines.

Younger sedimentary deposits, including late Holocene-age artificial fill (Qaf), late Holocene-age very young alluvial fan deposits (Qf), late Holocene-age very young lacustrine deposits (Ql), Holocene- to late Pleistocene-age young axial-channel deposits (Qya), Holocene- to late Pleistocene-age young alluvial fan deposits (Qyf), Holocene- to late Pleistocene-age young alluvial valley deposits (Qyv), and Holocene- to late Pleistocene-age young wash deposits (Qyw), are generally considered to be too young to contain *in situ* paleontological resources, and are, therefore, considered to have a low paleontological potential based on SVP (2010) guidelines.

Cretaceous-age Estelle Mountain Volcanics of Herzig (1991) (Kvem), Cretaceous-age Santigao Peak Volcanics (Kvsp), Cretaceous-age Gavilan Ring Complex (Kgh), Cretaceous-age granite, undifferentiated (Kgu), Triassic-age rocks of Menifee Valley, phyllite (Trmp), and Triassic-age rocks of Menifee Valley,

undifferentiated (Trmu) do not contain fossils due to their high heat of formation deep below the surface of the earth, and are therefore considered to have no paleontological potential based on SVP (2010) guidelines.

4.3 Field Survey

The Concordia Yard survey area is located north of Concordia Ranch Road at Black Powder Road, north of Interstate 15 (I-15) near Lake Elsinore, California. The site is situated in an open field between private ranches located in a broad valley with near the base of nearby foothills. The terrain is nearly exclusively flat with low relief hills near the northern side of the survey area that slope gently southerly with a total topographic differential of approximately 50 feet (Attachment B: Photos 1-3). Existing ground disturbances include a large concrete slab, exposed and partially buried pipelines, paved and unpaved roads, grading and spoils piles containing previously disturbed sediments, removed cement piles, fences, and miscellaneous debris (Attachment B: Photos 1 and 3-5). Additionally, most of the Concordia Yard surface is covered in previously disturbed and disked rolled sediments, as well as fresh grasses.

4.3.1 Geology

Sediments observed included previously disturbed sediments and middle to early Pleistocene-age very old axial-channel deposits (Qvoa). Previously disturbed sediments were observed mostly along the boundary limits of the survey area. Due to the minimal topographic relief, alluvial sediment exposures are limited to ground surface areas devoid of vegetation and the sidewalls and bases of low-relief drainages.

Pleistocene-age very old axial-channel (Qvoa) drainages range from less than one foot deep to approximately 4 feet deep (Attachment B: Photo 5). Very old axial-channel sediments consist of buff red-brown (weathered surface) to pale yellow-brown (fresh surface) colored, moderately to poorly sorted, fine- to very coarse-grained sand with some subangular granules, pebbles, and cobbles composed primarily of plutonic rock fragments (Attachment B: Photos 5-6). Exposures along drainage walls display some coarser gravels and cobbles within the outcropping (Attachment B: Photo 5).

4.3.2 Paleontology

No paleontological resources were observed or collected during the survey. However, sediments conducive to fossil preservation, particularly those of the Pleistocene-age very old axial-channel deposits (Qvoa), were observed.

5.0 RECOMMENDATIONS

Paleontological monitoring, spot-checking, and fossil recovery should be implemented throughout Segments VIG 4 through VIG8 in accordance with Mitigation Measures (MM) CR-4 and CR-5 and the Project's PRMP (Paleo Solutions, 2020). Full-time monitoring should be conducted during excavations impacting geologic units with high paleontological sensitivity, including middle to early Pleistocene-age very old axial-channel deposits (Qvoa), Pleistocene-age Pauba Formation (Qpf), and Paleocene-age Silverado Formation (Tsi), either at the surface or at depth beneath younger surficial sediments. Spot-checking should initially be conducted during excavations impacting geologic units with undetermined paleontological sensitivity, including late to middle Pleistocene-age old alluvial fan deposits (Qof) and middle to early Pleistocene-age very old alluvial fan deposits (Qvof). No paleontological monitoring or spot-checking is required in low paleontological sensitivity deposits, including late Holocene-age artificial fill (Qaf), late Holocene-age very young alluvial fan deposits (Qf), late Holocene-age very young lacustrine deposits (Ql), Holocene- to late Pleistocene-age young axial-channel deposits (Qya), Holocene- to late Pleistocene-age young alluvial fan deposits (Qyf), Holocene- to late Pleistocene-age young alluvial valley deposits (Qyv), and Holocene- to late Pleistocene-age young wash deposits (Qyw). Monitoring should not be conducted during excavations impacting geologic units with no paleontological sensitivity, including Cretaceous-age Estelle Mountain Volcanics of Herzig (1991) (Kvem),

Cretaceous-age Santigao Peak Volcanics (Kvsp), Cretaceous-age Gavilan Ring Complex (Kgh), Cretaceous-age granite, undifferentiated (Kgu), Triassic-age rocks of Menifee Valley, phyllite (Trmp), and Triassic-age rocks of Menifee Valley, undifferentiated (Trmu).

The Concordia Yard has been previously disturbed at the surface, there are no known paleontological resources within the yard, and ground disturbance in native sediments within the yard will be limited to augering 12-inch diameter holes. Per the Project's PRMP (Paleo Solutions, 2019), monitoring during augering is only required if the diameter is 3 feet or greater; therefore, paleontological monitoring is not required at the Concordia Yard. However, a paleontologist will be available on-call in the event of unanticipated discoveries.

A summary of the monitoring requirements for Segments VIG4 through VIG8 and the Concordia Yard is provided as Attachment C.

If you have any questions concerning the results for this study, please contact me at crichards@paleosolutions.com.

Sincerely,

Courtney Richards, M.S.

ATTACHMENT B: Photos

Photo 1. Concordia Yard paleontological field survey (conducted December 10, 2019): overview of the survey area along the northern half of the western side of the proposed Concordia Yard, showing access road and northern slope. View facing to the northeast.

Photo 2. Concordia Yard paleontological field survey (conducted December 10, 2019): overview of the Concordia Yard survey area along the northern access road pull out. View facing to the northeast.

Photo 3. Concordia Yard paleontological field survey (conducted December 10, 2019): overview taken from along the southern half of the eastern side of the proposed construction yard, showing nearby slopes and paved road adjacent to the Concordia Yard survey area. View facing to the northeast.

Photo 4. Concordia Yard paleontological field survey (conducted December 10, 2019): overview of the Concordia Yard survey area along the northern half of the eastern side of the proposed construction yard, showing the concrete slab. View facing to the southwest.

Photo 5. Concordia Yard paleontological field survey (conducted December 10, 2019): drainage channel exposure of middle to early Pleistocene-age very old axial-channel deposits (Qvoa), consisting primarily of sands and gravels. Larger cobbles and occasional boulders can be observed within the wash. Partially buried pipelines are exposed within the channel and near the top of the wash. View facing to the north.

Photo 6. Concordia Yard paleontological field survey (conducted December 10, 2019): weathered middle to early Pleistocene-age very old axial-channel deposits (Qvoa) as seen at and near the surface along the north end of the western side of the proposed Concordia Yard. View facing down.

ATTACHMENT C: Monitoring Locations
