Site History:

Originally known as Buena Island, Newby Island was reclaimed and used for agriculture purposes from 1870 to 1931. San Jose Scavenger Company bought the site and operated a burn dump until 1951 when it converted to a municipal landfill and continued operations to 1972. International Disposal Corporation of California became the present owner in 1972. This is an active, restricted access sanitary landfill site located at the west-end of Dixon Landing Road in Milpitas, California. This 342-acre site is adjacent to San Francisco Bay to the west, a mud slough and wetlands to the south, Coyote Creek to the north. There is a methane capture system, separately fenced and gated. The landfill is permitted and inspected monthly by City of San Jose, Code Enforcement, and monitored by the Santa Clara County Integrated Waste Management. There is no record of releases to groundwater in the files.

ARSENIC

Site History:

Site is part of Water Pollution Control Plant, serving San Jose, Santa Clara, Milpitas, Cupertino, Campbell, Los Gatos, Saratoga, and Monte Sereno. Between the 1962 and 1974, biosolids were discharged to a series of lagoons on the Site and allowed to accumulate. These accumulated biosolids remain onsite and are referred to as the legacy biosolids. The City of San Jose (City) now wishes to investigate possible management/reuse options for these biosolids in order to free up the lagoon area for other purposes. This includes investigation of possible contamination. Project is on inactive status until at least 2013, pending on approval of City of San Jose's Master Plan Environmental Impact Report.

The facility is using an in-ground concrete trench and used oil catchment system for their fleet maintenance operations. The oil catchment was full of used oil during the inspection and is estimated to be between 55-100 gallons of used oil. However, the effectiveness of the pump was unclear and the technician was unable to adequately describe the procedures for removing this oil. The inspector during the last APSA inspection dated 08/06/2018 also noted that this basin was full of oil, who stated that the basin has to be pumped out on a regular basis in order to remove the used oil. (3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;

2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and

ON-SITE TO OVERSEE ANNUAL MONITORING SYSTEM CERTIFICATION. TESTING WAS CONDUCTED BY MARIO ROMO WITH TEC ACCUTITE. MR. ROMO HAS CURRENT ICC AND VEEDER ROOT CERTIFICATIONS, EXP., 10/16/17 AND 2/1/2018. PRIOR TO AND AFTER COMPLETION OF TEST THERE WERE NO ACTIVE ALARMS AT THE VEEDER ROOT PANEL. THE FOLLOWING COMPONENTS WERE TESTED DURING THIS INSPECTION AND PASSED; - 2 STP SUMP SENSORS - 2 ANNULAR SENSORS (BRINE FILLED) TESTED FOR HIGH/LOW - 2 UDC SENSORS - FILL SUMP SENSORS * ALL SENSORS ABOVE PROVIDED AN AUDIBLE/VISUAL ALARM AT THE VEEDER ROOT PANEL. - OVERFILL PREVENTION WAS VERIFIED TO BE AT 90% FOR BOTH TANKS. OVERFILL ALARM PROVIDED AN AUDIBLE/VISUAL AT THE ANNUNCIATOR OUTSIDE. THE FOLLOWING INFORMATION WAS REVIEWED DURING THIS INSPECTION: - DO MONTHLY RECORDS FOR THE PAST 12 MONTHS. - EMPLOYEE TRAINING IS CURRENT AS OF 03/23/2017 FOR ALL EMPLOYEES AT THIS SITE. - THE LAST CERS SUBMITTAL WAS CONDUCTED ON 12/6/2016 AND THIS WAS REVIEWED DURING THIS [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Testing was conducted with Mr. Andrew Pace of TEC Accutite, Inc. Mr. Pace had the following required certifications for testing: - ICC UST Service Technician (exp. 1/10/2024) - Veeder Root TLS-3XX (exp. 7/30/2022) This facility is a fueling station for City of San Jose Water Pollution Control Plant vehicles. The underground tank system consists of two tanks containing diesel and unleaded regular fuel respectively. Each tank is connected to a dispenser that is supplied fuel via conventional suction system. The following components of the monitoring system were tested today and passed: 1) 2 x 794390-303 dual point hydrostatic sensors in the annular spaces of the tanks were tested by removing the sensor from the interstitial brine for low liquid alarm, then testing the sensor in an adequate height of water for high [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

On-site to witness the annual monitoring system certification and spill bucket test performed by Mr. Mario Romero of TEC-Accutite. Site consists of two tanks (B5 biodiesel and Regular Unleaded), conventional suction, and two dispensers. The tanks, sumps (fill and automatic tank gauge (ATG) probe) and under dispenser containment (UDC) are monitored by a Veeder-Root (VR) TLS-350. The tank annulars are hydrostatically monitored. The sensors (VR -303) were tested by removing them from the brine (low) and then inverting (high). Both states provided audible and visible alarms. The sump and UDC sensors (VR -208) were tested in water and provided audible and visible alarms. The UDC sensors also caused the pumps to de-activate. Overfill is provided by the ATG set at 90% and an audible and visible alarm at the fill point. The ATG was removed and simulated overfill condition. The audible and visible alarm functioned as required. The spill buckets are contained in the and [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:

(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:
(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Returned to compliance on 12/05/2015. ABOVEGROUND TANK INSPECTIONS REVIEWED DURING THIS INSPECTION FOR THE PAST 3 YEARS WERE MISSING THE DAYS WITHIN MONTHS FOR 2013 AND 2014. ADDITIONALLY, AUGUST AND SEPTEMBER 2014 WERE MISSING THE COMPLETE MONTHS. ENSURE THAT DAILY INSPECTIONS OF THE AGT USED OIL TANKS ARE CONDUCTED AND DOCUMENTED. ENSURE THAT THESE LOGS ARE AVAILABLE FOR FUTURE INSPECTIONS.

Violation Description:

Failure of the owner or operator to conduct inspections and maintain inspection records at the facility of the following tank equipment:
1) Overfill/spill control equipment (e.g., waste-feed cutoff systems, bypass systems, and drainage systems) to ensure that it is in good working order;
2) The aboveground portions of the tank system, if any, to detect corrosion or releases of waste;
3) Data gathered from monitoring equipment and leak-detection equipment, (e.g., pressure and temperature gauges, monitoring wells) to ensure that the tank system is being operated according to its design;
4) The construction materials and the area immediately surrounding the externally accessible portion of the tank system including secondary containment structures (e.g., dikes) to detect erosion or signs of releases of hazardous waste (e.g., wet spots, dead vegetation); and
5) For uncovered tanks, the level of waste in the tank, to ensure compliance with section 66265.194(b)(3).

DURING THE RECORDS REVIEW PORTION OF THIS INSPECTION A COPY OF THE TANK SYSTEM ASSESSMENT WAS NOT PROVIDED FOR THE 3 AGT OF USED OIL STORED AT THIS LOCATION (1 TANK ON THE WEST SIDE, 2 OTHER TANKS ON THE MAIN FLOOR). WITHIN 30 DAYS PROVIDE A COPY OF THE TANK ASSESSMENT TO OUR OFFICE FOR REVIEW.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:
(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that

will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Site History:

Site is part of Water Pollution Control Plant, serving San Jose, Santa Clara, Milpitas, Cupertino, Campbell, Los Gatos, Saratoga, and Monte Sereno. Between the 1962 and 1974, biosolids were discharged to a series of lagoons on the Site and allowed to accumulate. These accumulated biosolids remain onsite and are referred to as the legacy biosolids. The City of San Jose (City) now wishes to investigate possible management/reuse options for these biosolids in order to free up the lagoon area for other purposes. This includes investigation of possible contamination. Project is on inactive status until at least 2013, pending on approval of City of San Jose's Master Plan Environmental Impact Report.

IDC of California Inc is a sanitary landfill that is operated under the name Newby Island Sanitary Landfill. Newby Island started being used as a landfill in 1931 when it was bought by San Jose Scavenger Company. In 1972, it was purchased by International Disposal Corporation of California (IDC) which is a wholly owned subsidiary of Browning-Ferris Industries of California, Inc, which in turn is a subsidiary of Republic Services, Inc.

Throughout Newby Island's ownership history, they have never accepted hazardous waste. Various letters from the County of Santa Clara, the Depertment of Toxic Substances Control, and the San Francisco Water Quality Control Board confirm that Newby Island has not accepted hazardous wastes and operates as a generator.

Facility History:

Allied Technology Group, Inc. (ATG) treated lighting wastes of fluorescent lamps, high intensity discharge (HID) lamps, and ballasts in Fremont, California since 1994. ATG first operated its facility under a Research, Development and Demonstration Variance issued by the Department of Toxic Substances Control on March 11, 1994. The variance allowed ATG to operate the facility to determine the optimal conditions for the treatment of hazardous lighting wastes. Management of lighting wastes is a non-RCRA hazardous waste regulated by the State of California. The waste treatment processes yielded recyclable components such as glass, aluminum, copper and elemental mercury that would otherwise be unrecoverable.

While ATG's application for a Standardized Permit was being processed, DTSC issued ATG a Consent Order on May 24, 1996 to allow them to continue the activities authorized under their variance. On November 1, 2000, DTSC issued ATG a Series A Standardized Hazardous Waste Facility Permit (Permit) to allow them to treat and store hazardous waste. The Permit was valid for 10 years. The Permit authorized ATG to receive and recycle spent fluorescent and high intensity lamps, and other universal wastes. On June 19, 2001, ATG notified DTSC of the closure of the facility due to loss of its lease. The recycling operations ceased during the week ending June 15, 2001.

On August 28, 2001, ATG submitted a Facility Closure Report Certification. The closure report certified that the facility was closed in accordance with the approved Closure Plan dated June 27, 2000. The facility closure activities included decontamination of the building and equipment, confirmation sampling and analysis, and shipment of hazardous wastes generated during decontamination to appropriate disposal facility Closure sampling analysis indicated that decontamination of the building and equipment has been accomplished to either non-detect or background levels.

On October 4, 2001, DTSC approved the closure report and considered ATG to be officially closed.

Site History:

Allied Technology Group, Inc. (ATG) treated lighting wastes of fluorescent lamps, high intensity discharge (HID) lamps, and ballasts in Fremont, California since 1994. ATG first operated its facility under a Research, Development and Demonstration Variance issued by the Department of Toxic Substances Control on March 11, 1994. The variance allowed ATG to operate the facility to determine the optimal conditions for the treatment of hazardous lighting wastes. Management of lighting wastes is a non-RCRA hazardous waste regulated by the State of California. The waste treatment processes yielded recyclable components such as glass, aluminum, copper and elemental mercury that would otherwise be unrecoverable.

While ATG's application for a Standardized Permit was being processed, DTSC issued ATG a Consent Order on May 24, 1996 to allow them to continue the activities authorized under their variance. On November 1, 2000, DTSC issued ATG a Series A Standardized Hazardous Waste Facility Permit (Permit) to allow them to treat and store hazardous waste. The Permit was valid for 10 years. The Permit authorized ATG to receive and recycle spent fluorescent and high intensity lamps, and other universal wastes. On June 19, 2001, ATG notified DTSC of the closure of the facility due to loss of its lease. The recycling operations ceased during the week ending June 15, 2001.

On August 28, 2001, ATG submitted a Facility Closure Report Certification. The closure report certified that the facility was closed in accordance with the approved Closure Plan dated June 27, 2000. The facility closure activities included decontamination of the building and equipment, confirmation sampling and analysis, and shipment of hazardous wastes generated during decontamination to appropriate disposal facility Closure sampling analysis indicated that decontamination of the building and equipment has been accomplished to either non-detect or background levels.

On October 4, 2001, DTSC approved the closure report and considered ATG to be officially closed.
