SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 03/07/2016

Data Release Frequency: Quarterly

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 12/09/2015

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 12/09/2015

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 05/04/2016

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

EDR PROPRIETARY RECORDS

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

EXECUTIVE SUMMARY

A Biological Resources Technical Report (BRTR) has been prepared for the Estrella Substation component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by Pacific Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC (NEET West). NEET West proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by PG&E that together comprise Estrella Substation, in north-central San Luis Obispo County. The new substation, bound by Union Road to the south and surrounded by agricultural lands, will occupy approximately 15 acres of land currently under vineyard cultivation.

This BRTR was prepared to document the existing biological resources in the vicinity of the entire substation project site, including the 230 kV substation, the adjacent 230 kV interconnection, and the 70 kV substation. Biological resources considered for this report include sensitive species of plants and animals, sensitive habitats and natural communities, and water features potentially subject to state or federal jurisdiction. A literature review of existing information and field surveys were conducted to document biological resources at the substation site encompassed within a Biological Study Area (BSA). This report outlines the methodologies that were used to assess biological resources and documents existing biological resources in the vicinity of the substation portion of the project.

No special-status plant or wildlife species were observed in the substation BSA. Ten special-status plant species and 23 special-status wildlife species were determined to be either likely, have potential, or be unlikely to occur in the substation BSA. There is also high potential for avian species to nest in the substation BSA during the typical nesting season (February 1–August 31). The substation BSA is located in federally designated vernal pool fairy shrimp (*Branchinecta lynchi*) critical habitat; however, suitable habitat for this species was not observed in the substation BSA. Dry Creek, an ephemeral drainage channel, was observed in the northeast corner of the substation BSA. This feature may be subject to U.S. Army Corps of Engineers, California Department of Fish and Wildlife, and/or Regional Water Quality Control Board jurisdiction. This feature may also serve as a wildlife migration corridor for dispersal of species between local areas and at larger scales between regions.

1 INTRODUCTION

NextEra Energy Transmission West, LLC (NEET West) proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by Pacific Gas and Electric Company (PG&E) that together comprise Estrella Substation, in northern San Luis Obispo County, California (Figure 1). NEET West is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by NEET West and PG&E.

This Biological Resources Technical Report (BRTR) was prepared to document the existing biological resources in the vicinity of the substation portions of the project. A similar report has been prepared for the power line component of the project, and the results of that effort are presented under separate cover.

Biological resources considered include sensitive and common plants and animals, habitats and sensitive natural communities, wildlife movement corridors, and water features potentially subject to state or federal jurisdiction. This report describes the methodologies used to assess the biological resources known to occur and with the potential to occur at the project and documents existing biological resources in the vicinity of the substation portion of the project.

A Biological Study Area (BSA) was established to include the maximum anticipated extent of project-related effects. The BSA for the project substation site consists of an additional 250-foot area around the approximately 35-acre option property area encompassing the entire extent of Estrella Substation (approximately 15 acres) (Figure 2). Field surveys focused on areas within the BSA, as described in Section 3.3, Field Surveys, below.

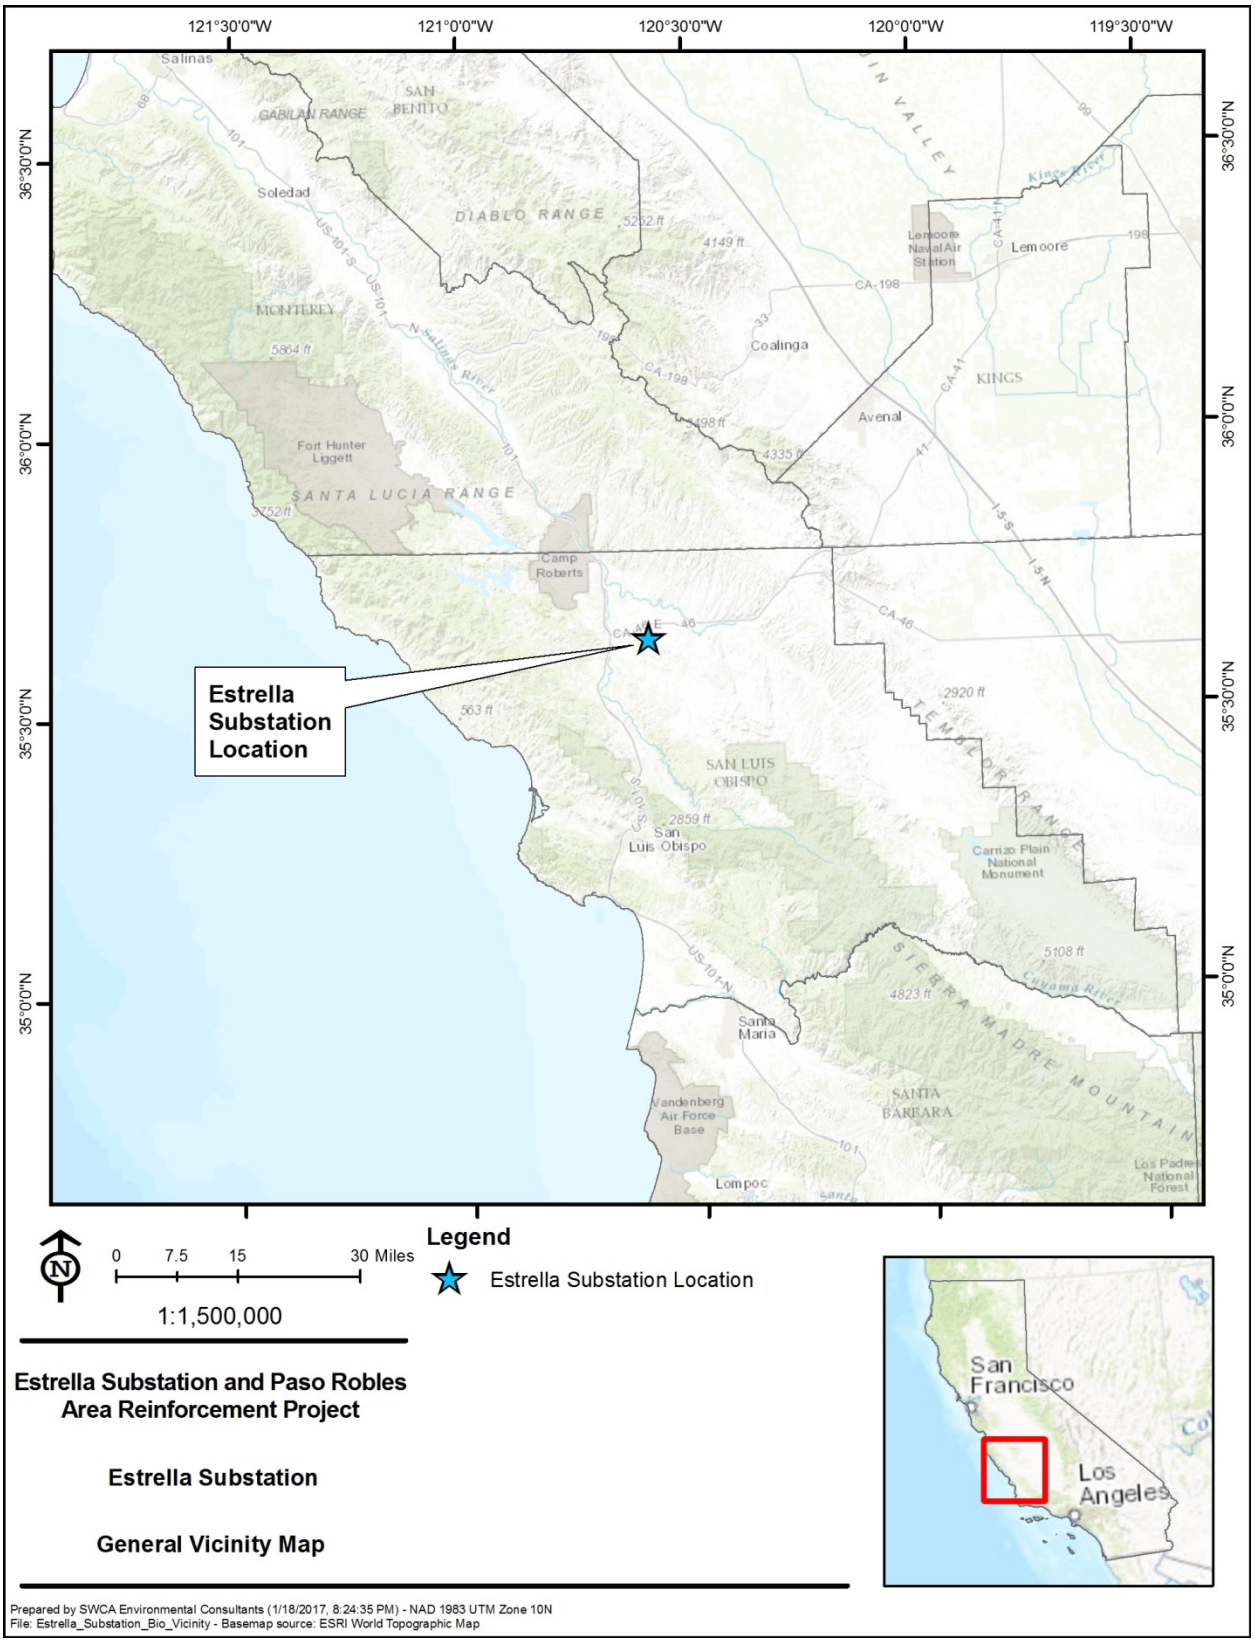
1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The project substation site is located on approximately 15 acres within an approximately 98-acre privately owned parcel (Assessor's Parcel Number [APN] 015-053-011).

1.2 Project Component

Estrella Substation will be comprised of two separate and distinct substations. One 230 kV substation will be constructed, operated, and owned by NEET West and one 70 kV substation will be constructed (following site preparation and rough grading work by NEET West), operated, and owned by PG&E. The 230 kV substation will be interconnected to the existing adjacent 230 kV transmission line. Access to the Estrella Substation site will be off Union Road, on a new main private access road.

Figure 1. General Vicinity Map



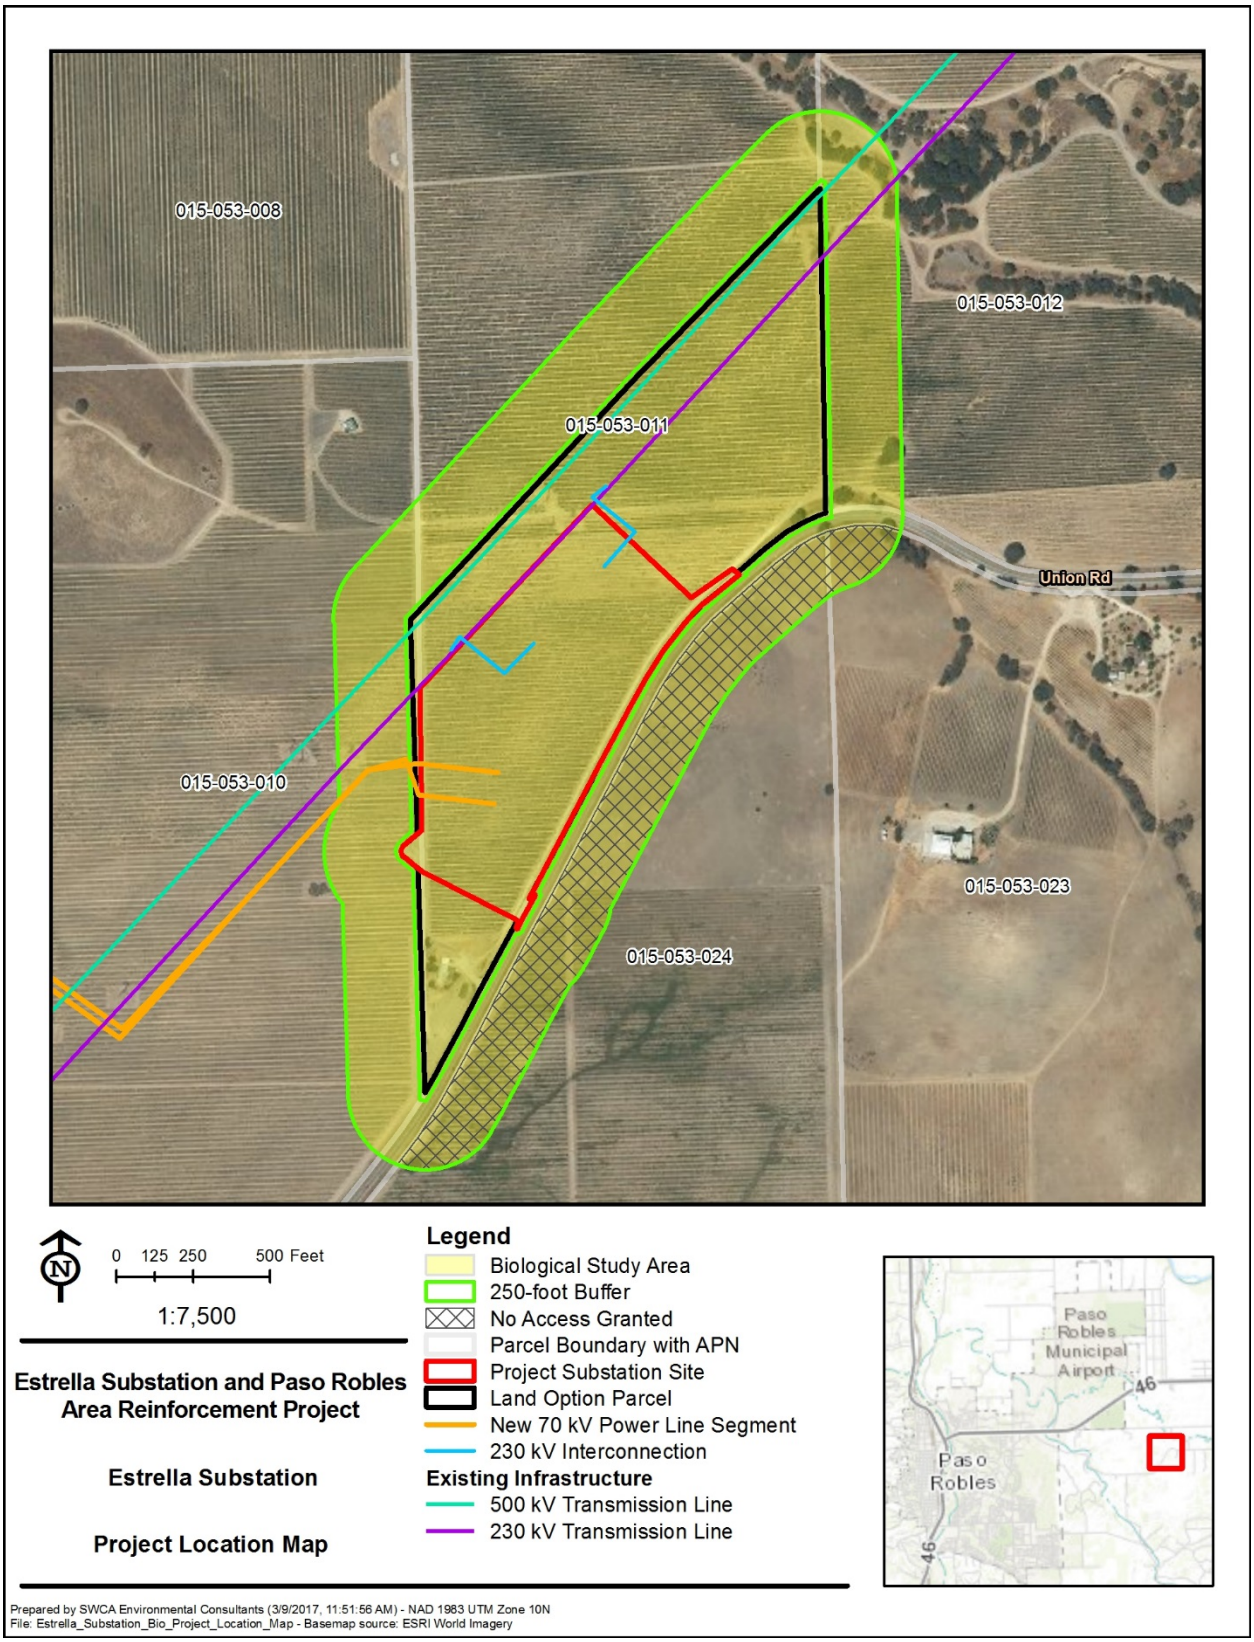


Figure 2. Project Location Map

2 REGULATORY BACKGROUND

2.1 Federal

2.1.1 Endangered Species Act

The federal Endangered Species Act (ESA) of 1973 (United States Code [U.S.C.] Title 16, Sections 1531–1544)*, as amended,* protects plants, fish, and wildlife that are listed as endangered or threatened by the U.S. Fish and Wildlife Service (USFWS) or the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries). Section 9 of the ESA prohibits the "take" of listed fish and wildlife, where "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (Code of Federal Regulations [CFR] Title 50, Section 17.3). For plants, this statute prohibits removing, possessing, maliciously damaging, or destroying any listed plant *under federal jurisdiction* and removing, cutting, digging-up, damaging, or destroying any listed plant in knowing violation of state law (16 U.S.C. 1538).

The ESA allows for issuance of incidental take permits to private parties either in conjunction with a Habitat Conservation Plan (HCP) or as part of a Section 7 consultation (which is discussed in the following paragraph). Under Section 10 of the ESA, a private party may obtain incidental take coverage by preparing an HCP to cover target species within the project area, identifying impacts to the covered species, and presenting the measures that will be undertaken to avoid, minimize, and mitigate such impacts.

Under Section 7 of the ESA, federal agencies are required to consult with USFWS and/or NOAA Fisheries, as applicable, if their actions—including permit approvals or funding—may affect a federally listed species (including plants) or designated critical habitat. If the project is likely to adversely affect a species, the federal agency will initiate formal consultation with USFWS and/or NOAA Fisheries and issue a biological opinion as to whether a proposed agency action(s) is likely to jeopardize the continued existence of a listed species (jeopardy) or adversely modify critical habitat (adverse modification). As part of the biological opinion, USFWS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity, provided that the action will not jeopardize the continued existence of the species or adversely modify designated critical habitat.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 (16 U.S.C. 703–711) protects all migratory birds, including active nests and eggs. Birds protected under the MBTA include all native waterfowl, shorebirds, hawks, eagles, owls, doves, and other common birds such as ravens, crows, sparrows, finches, swallows, and others, including their body parts (for example feathers and plumes), active nests, and eggs. A complete list of protected species can be found in 50 CFR 10.13. Enforcement of the provisions of the federal MBTA is the responsibility of USFWS.

2.1.3 Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (BGEPA) of 1940 (16 U.S.C. 668) specifically protects bald and golden eagles and their nests from intentional harm or trade in parts of these species. The 1972 amendments increased penalties for violating provisions of the BGEPA or regulations issued pursuant thereto and strengthened other enforcement measures. Rewards are provided for information leading to arrest and conviction for violation of the BGEPA.

2.1.4 Clean Water Act

2.1.4.1 WATERS AND WETLANDS: CLEAN WATER ACT SECTIONS 401 AND 404

The purpose of the Clean Water Act (CWA) (33 U.S.C. 1251 et seq.) is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Waters of the United States include rivers, streams, estuaries, the territorial seas, ponds, lakes, and wetlands. Wetlands are defined as those areas "that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3).

The U.S. Environmental Protection Agency (USEPA) and U.S. Army Corps of Engineers (USACE) have recently released a new rule that would revise this definition and clarify which bodies of water are covered by the CWA. However, on October 9, 2015, the U.S. Court of Appeals for the 6th Circuit granted a nationwide stay on the rule, and the previous interpretations and guidance remain in effect until further notice.

USACE issues permits for work in wetlands and other waters of the United States based on guidelines established under Section 404 of the CWA. Section 404 of the CWA prohibits the discharge of dredged or fill material into waters of the United States, including wetlands, without a permit from USACE. USEPA also has authority over wetlands and may, under Section 404(c), veto a USACE permit.

Section 401 of the CWA requires all Section 404 permit actions to obtain a state Water Quality Certification or waiver.

2.2 State

2.2.1 California Endangered Species Act

Sections 2050–2098 of the California Fish and Game Code (the California Endangered Species Act [CESA]) prohibit the take of state listed endangered and threatened species unless specifically authorized by the California Department of Fish and Wildlife [CDFW]). The state definition of "take" is to hunt, pursue, catch, capture, or kill a member of a listed species or attempt to do so. CDFW administers the CESA and authorizes take through permits or memorandums of understanding issued under Section 2081 of the CESA, or through a consistency determination issued under section 2080.1. CESA Section 2090 requires state agencies to comply with threatened and endangered species protection and recovery and to promote conservation of these species.

2.2.2 Fully Protected Species Under the California Fish and Game Code

The California Fish and Game Code designates certain fish and wildlife species as "fully protected" under Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish). Fully protected species may not be taken or possessed at any time, and no permits may be issued to PG&E for incidental take of these species. [1]

[1] While take of fully protected species may be authorized by CDFW under a Natural Communities Conservation Plan (NCCP), PG&E activities are not covered by an NCCP so this permitting option is not available.

2.2.3 Protection for Birds: California Fish and Game Code

California Fish and Game Code Section 3503 et seq. state that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders of Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird.

2.2.4 Native Plant Protection Act of 1977

The Native Plant Protection Act of 1977 (NPPA; California Fish and Game Code Sections 1900–1913) includes provisions that prohibit the taking of endangered or rare native plants. CDFW administers the NPPA and generally regards as rare many plant species included on California Rare Plant Rank (CRPR) 1A, 1B, 2A, and 2B of the California Native Plant Society (CNPS) Inventory of Rare and Endangered Vascular Plants of California. In addition, sometimes CRPR 3 and 4 plants are considered if the population has local significance in the area and is impacted by the project.

Section 1913(b) of the California Fish and Game Code includes a specific provision to allow for the incidental removal of endangered or rare plant species, if not otherwise salvaged by CDFW, within a right-of-way to allow a public utility to fulfill its obligation to provide service to the public.

2.2.5 California Species of Special Concern

Species of Special Concern (SSC) is a category conferred by CDFW to fish and wildlife species that meet the state definition of threatened or endangered, but have not been formally listed (e.g., federally or state listed species), or are considered at risk of qualifying for threatened or endangered status in the future based on known threats. SSC is an administrative classification only, but these species should be considered "special-status" for the purposes of the California Environmental Quality Act (CEQA) analysis (see the Significance Criteria section of this document).

2.2.6 Porter-Cologne Water Quality Control Act

The State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCB) have jurisdiction over all surface water and groundwater in California, including wetlands, headwaters, and riparian areas. SWRCB or the applicable RWQCB must issue waste discharge requirements for any activity that discharges waste that could affect the quality of waters of the state.

2.2.7 Lake and Streambed Alteration Agreement Under the California Fish and Game Code

In addition to listed and special-status species, CDFW regulates activities under California Fish and Game Code Sections 1600–1616 that require a streambed alteration agreement permit. California Fish and Game Code Section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following:

- Substantially divert or obstruct the natural flow of any river, stream, or lake.
- Substantially change or use any material from the bed, channel, or bank of any river, stream, or lake.
- Deposit debris, waste, or other materials that could pass into any river, stream, or lake.

2.3 Local

This section includes a summary of local or regional plans, policies, or regulations that identify sensitive or special-status species in the project area, as well as local polices or ordinances that protect biological resources. Because CPUC has exclusive jurisdiction over the siting, design, and construction of the project, the project is not subject to local discretionary regulations related to biological resources. The following summary is provided for informational purposes and to assist with CEQA review.

2.3.1 County of San Luis Obispo General Plan

The County of San Luis Obispo General Plan includes a Conservation and Open Space Element (COSE), which addresses the protection and management of natural resources, as well as goals, policies, and strategies to conserve, protect, and restore biodiversity and open space (County of San Luis Obispo 2010). The COSE includes seven goals and policies within those goals. Specific goals pertaining to biological resources identified in the COSE include:

- **Goal BR 1** Native habitat and biodiversity will be protected, restored, and enhanced;
- **Goal BR 2** Threatened, rare, endangered, and sensitive species will be protected;
- **Goal BR 3** Maintain the acreage of native woodlands, forests, and trees at 2008 levels;
- **Goal BR 4** The natural structure and function of streams and riparian habitat will be protected and restored;
- **Goal BR 5** Wetlands will be preserved, enhanced, and restored;
- **Goal BR 6** The County's fisheries and aquatic habitats will be preserved and improved; and,
- **Goal BR 7** Significant marine resources will be protected.

2.3.2 County of San Luis Obispo Oak Woodlands Management Plan

The Native Tree Committee of the County of San Luis Obispo (County) has established an Oak Woodland Management Plan to encourage the long-term conservation of oak woodlands. The plan is voluntary and for informational purposes only and is not bound by the law. The plan discusses the status, economic values, natural resource values, and aesthetic and open space values of oak woodlands. In addition, the plan offers the following conservation efforts: (1) design around existing oaks; (2) encourage clustered, denser developments; (3) encourage landscaping with oak trees/natives; (4) improve oak regeneration on grazed lands; and (5) purchase conservation easements (County of San Luis Obispo 2003).

2.3.3 County of San Luis Obispo San Joaquin Kit Fox Mitigation Requirements

The County evaluates impacts to San Joaquin kit fox (*Vulpes macrotis mutica*) for County-permitted projects to ensure impacts to kit fox are mitigated to an insignificant level under CEQA. CDFW and the County have developed mitigation measures to reduce impacts to San Joaquin kit fox habitat to an insignificant level. In addition, pre-determined standard mitigation ratios have been developed for County-permitted projects located within kit fox habitat areas (County of San Luis Obispo 2006).

The project is located within a County-designated kit fox habitat area with recommended general measures and practices. The project proponents will take into consideration local policies and land use priorities and concerns as they relate to biological resources; however, the project is exempt from the County's discretionary permitting and mitigation and CPUC is the lead agency under CEQA.

3 METHODOLOGY

A biological resources study was conducted to support this BRTR using a literature review and field surveys to document the potential for biological resources to occur within the project substation site.

3.1 Literature and Records Review

Biologists reviewed available regional and local natural resources information including published and unpublished documents, publicly available data, and plant records. The California Natural Diversity Database (CNDDB) was queried for all species reports within 5 miles of the project substation site. Database searches for CNPS occurrences included the nine U.S. Geological Survey (USGS) 7.5-minute quadrangles at and surrounding the project substation site—Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel. The following resources were reviewed with respect to site-specific information

- CDFW CNDDB (CDFW 2016a);
- CNPS Rare Plant Program (CNPS 2016);
- eBird: An online database of bird distribution and abundance [web application] (eBird 2012);
- A Guide to the Amphibians and Reptiles of California (California Herps 2000–2016);
- Natural Resources Conservation Service (NRCS) Web Soil Survey (U.S. Department of Agriculture [USDA] NRCS 2016a);
- USFWS Critical Habitat Portal (USFWS 2016a),
- USGS 7.5-minute series topographic quadrangle maps (USGS 2016b); and,
- Aerial imagery of the project substation site.

Biological resources data were collected and overlaid on to geospatial maps from desktop and field sources to develop a Geographic Information Systems (GIS) database specific to the project. The database provides relevant sensitive species location data, habitat types (including vegetation cover), potential jurisdictional water features (including ditches and drainages), and critical habitat for federally listed species. The data were compiled using ArcGIS software.

3.2 Sensitive Biological Resources

Sensitive plants and animals are defined within this report to include species, subspecies, varieties, and populations recognized by USFWS and CDFW that are classified into the following categories:

- Species and subspecies listed or proposed for listing by the state of California as threatened or endangered pursuant to the CESA.

- Animals listed on the California Special Animals List as Species of Special Concern and Fully Protected.

- Species, subspecies, and populations listed or proposed for listing as threatened or endangered pursuant to the federal ESA, and species that are candidates for such listings.

- Plants included in the Special Vascular Plants, Bryophytes, and Lichens List (CDFW 2016c) with a threatened, endangered, SSC, or CRPR rank of 1 or 2.

- Plants assigned CRPR 1 and 2.

Additionally, riparian habitats and water bodies likely under the jurisdiction of USACE, CDFW, and/or RWQCB were considered.

Throughout this report, species, subspecies, varieties, and populations of species are broadly referred to as "species," a term that is used in this BRTR to indicate the pertinent taxonomic levels that are recognized by the state and federal governments with jurisdiction over plants and animals.

Records of sensitive plants, animals, and natural communities within the Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel USGS 7.5-minute quadrangles were queried from the CNDDB RareFind 5 (CDFW 2016a) and CNPS Online Inventory of Rare and Endangered Plants (CNPS 2016) databases. Using the information generated from literature reviews and field surveys, the list of special-status species with the potential to occur was further refined to reflect the species that may occur within the BSA. The likelihood of special-status species occurrence was determined based on natural history parameters, including, but not limited to, the species' range, habitat, foraging needs, migration routes, and reproductive requirements. For the purpose of this study, potential for occurrence determinations were made using the following general categories:

- *Present* – Reconnaissance-level, focused, or protocol-level surveys documented the occurrence or observation of a species in the BSA.

- *Seasonally present* – Individuals were observed in the BSA only during certain times of the year.

- *Likely to occur* – The species has a strong likelihood to be found in the BSA prior to or during construction but has not been directly observed to date during project surveys. The likelihood that a species may occur is based on the following considerations: suitable habitat that meets the life history requirements of the species is present in the BSA; migration routes or corridors are within the BSA; records of sighting are documented within or near (5 miles) the BSA; and there is an absence of invasive predators (e.g., bullfrogs). The main assumption is that records of occurrence have been documented within or near (5 miles) the BSA, the BSA falls within the range of the species, suitable habitat is present, but it is undetermined whether the habitat is currently occupied.

- *Potential to occur* – There is a possibility that the species can be found in the BSA prior to or during construction, but has not been directly observed to date. The likelihood that a species may occur is based on the following conditions: suitable habitat that meets the life history requirements of the species is present within the BSA; migration routes or corridors are within the BSA; and there is an absence of invasive predators (e.g., bullfrogs). The main assumption is that the BSA falls within the range of the species, suitable habitat is present, but no records of sighting are located within or near (5 miles) the BSA, or the records are old and unreliable and it is undetermined whether the habitat is currently occupied.

- *Unlikely to occur* – The species is not likely to occur in the BSA based on the following considerations: lack of suitable habitat and features that are required to satisfy the life history requirements of the species (e.g., absence of foraging habitat, lack of reproductive areas, and lack of sheltering areas); presence of barriers to migration/dispersal; presence of predators or invasive species that inhibit survival or occupation (e.g., the presence of bullfrogs or invasive fishes); or lack of hibernacula, hibernation areas, or aestivation areas on site.

- *Absent* – Suitable habitat does not exist in the BSA, the species is restricted to or known to be present only within a specific area outside of the BSA, or focused or protocol-level surveys did not detect the species.

3.3 Biological Study Area

A BSA, which included an additional 250-foot area around the boundary of the project substation site (Figure 2), was established to include the maximum anticipated extent of project-related effects. Field surveys focused on areas within the BSA, as described in Section 3.4, Field Surveys, below.

3.4 Field Surveys

Biologists conducted general reconnaissance-level field surveys on March 3 and 4, 2016. Reconnaissance-level surveys included documentation of plants and animals, vegetation types, and identification of waters, wetlands, and riparian areas that were potentially under the jurisdiction of USACE, CDFW, and/or RWQCB. Vegetation communities were classified using Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Habitat was evaluated for potential to support those special-status species identified during the desktop review, and detailed notes and photographs were taken to support determinations of the potential for those species to occur within the BSA (Appendices A, B, and C). The BSA was examined for presence or signs of occupation by special-status species (e.g., footprints, scat, feathers, or burrows) and auditory information (for example specific vocalizations of birds). Binoculars were also used to facilitate identification of species. Trees and other structures (such as buildings and bridges) within the BSA were scanned for avian nests and roosting locations. A handheld Trimble GeoXT Global Positioning System (GPS) unit capable of sub-meter accuracy was used to record locations of any sensitive resources and other potential constraints to the project. A compiled list of all plant species observed during the surveys is included as Appendix A, and a compiled list of all wildlife species observed during the surveys is included as Appendix B.

Two rounds of botanical surveys were conducted by biologists between March 3 and 4, 2016, and on May 6, 2016. Botanical surveys were conducted over a range of bloom periods to capture the flowering period of all special-status plants that were determined to have a likelihood for occurrence in the BSA. CDFW's Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities (CDFW 2009) was generally followed to facilitate a consistent and systematic approach to the survey and assessment of special-status native plants and natural communities so that reliable information was produced and the potential of locating a special-status plant species or natural community was maximized. Surveys were conducted by walking transects throughout the BSA where suitable habitat was present to ensure thorough coverage. Every plant taxon that was observed in the BSA was identified to the taxonomic level necessary to determine rarity and listing status (Appendix A). The surveyors referred to The Jepson Manual (Baldwin et al. 2012) to verify plant identification. The surveyors mapped all special-status occurrences with a handheld Trimble GeoXT GPS unit capable of sub-meter accuracy.

All surveys were conducted by walking meandering transects approximately 75–100 feet wide, between vineyard rows, and throughout the entire BSA, where access was permitted. A small portion of the BSA along the southeast side of the project substation site had restricted access (Figure 2) and therefore was surveyed using high-powered binoculars. All special-status species and sensitive biological resources that were observed during the field surveys were recorded using a Trimble GPS unit capable of sub-meter accuracy. Compiled lists of all plant and animal species observed during the surveys are included as Appendices A and B.

Potential jurisdictional wetlands and waters of the State and United States were mapped at the desktop level using data available from the National Wetlands Inventory (USFWS 2016b), USGS topographic maps, and aerial photographs. Wetland mapping field efforts were conducted in all areas suspected of having jurisdictional wetlands or waters. Delineation of potentially jurisdictional areas within the BSA was based on on-site investigations conducted in March 2016. Presence of hydrophytic vegetation, hydrological conditions, hydric soil indicators, ordinary high water marks (OHWMs), and/or defined bed and banks were

evaluated. Refer to Section 4.3.1, Jurisdictional Waters, below for additional detail regarding jurisdictional waters within the BSA.

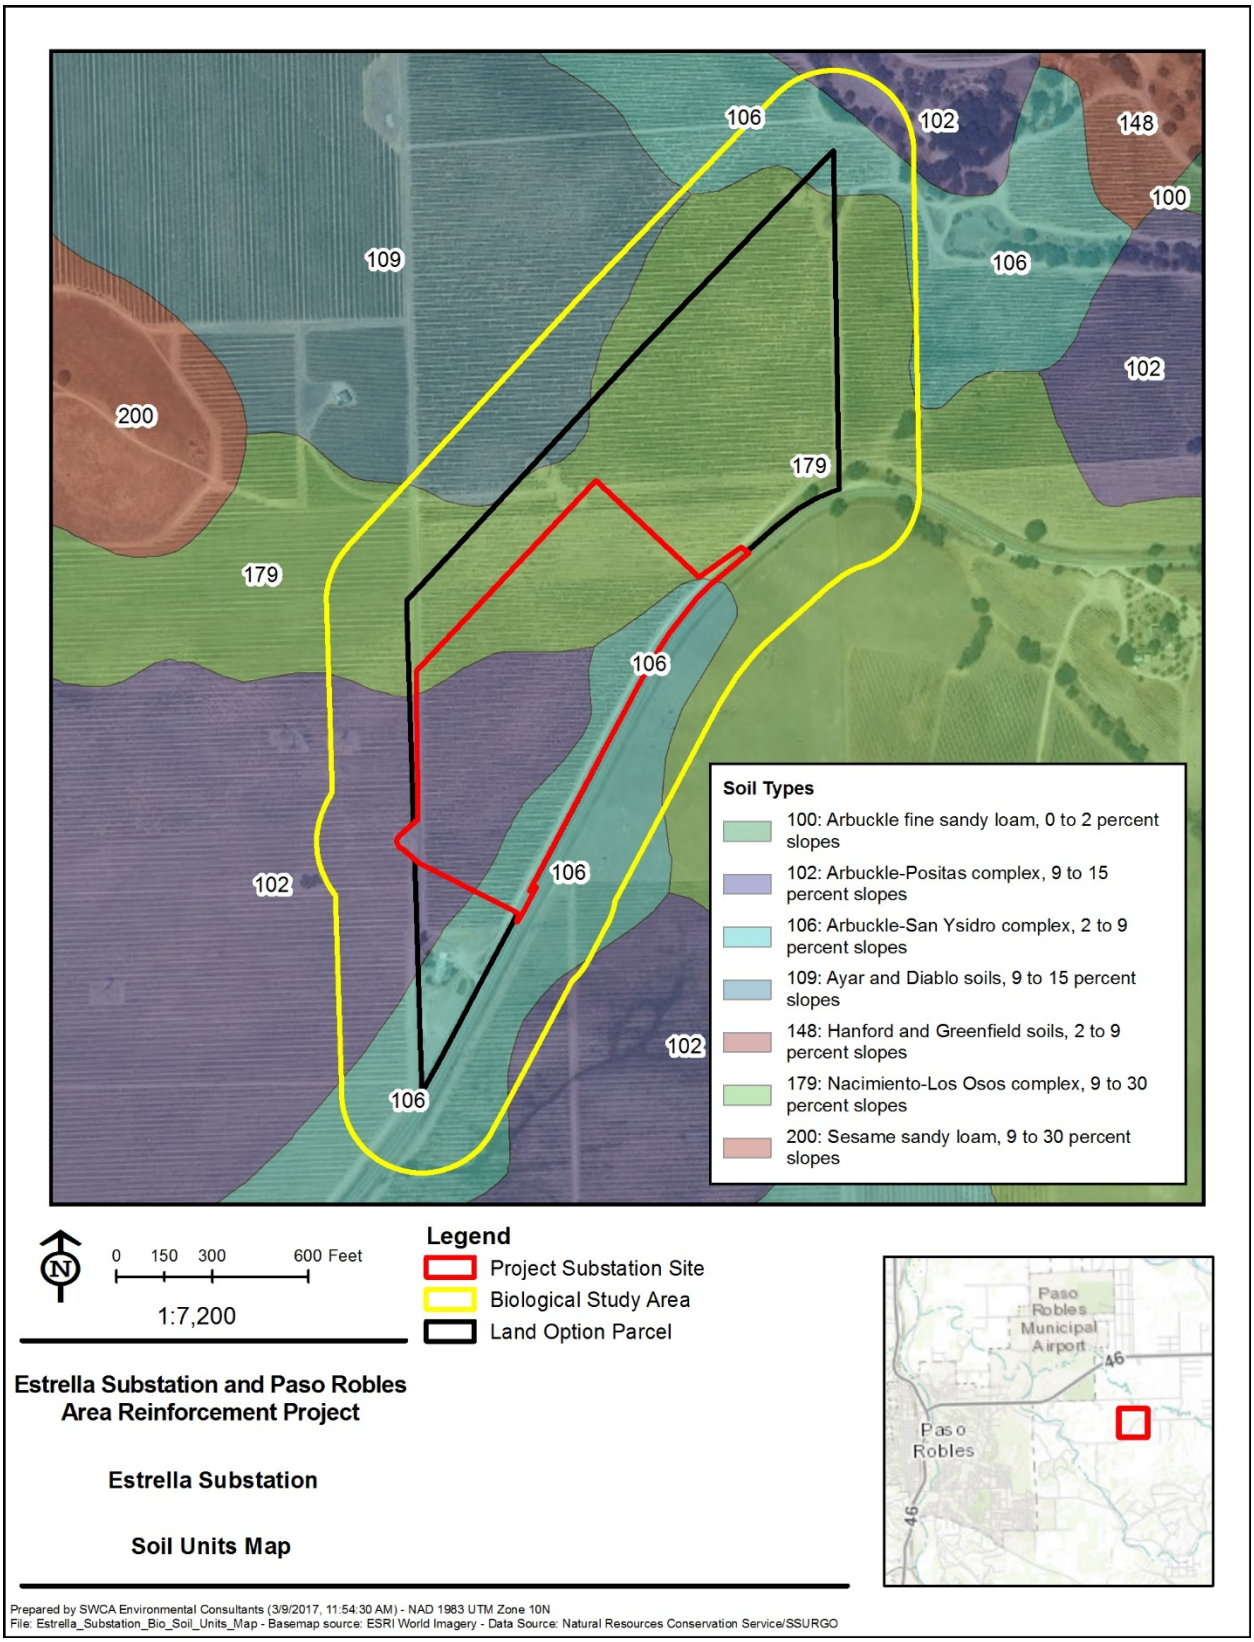
Additional surveys were conducted between June 11 and 12, 2016, to assess the project site for suitable San Joaquin kit fox (*Vulpes macrotis mutica*) habitat. Biologists walked transects approximately 10 feet apart. In the vineyard survey areas, all vineyard rows were surveyed. Biologists measured all small mammal burrows with 4-inch ball probes. Any small mammal burrows observed to be 4 inches or larger were mapped using a Trimble GPS unit capable of sub-meter accuracy. This survey protocol was developed based on information provided in the U.S. Fish and Wildlife Service San Joaquin Kit Fox Survey Protocol for the Northern Range (USFWS 1999), and based on the biologists' experience in conducting San Joaquin kit fox surveys.

3.5 Nomenclature Conventions

Vegetation alliance nomenclature in this report follows Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Taxonomic conventions follow The Jepson Manual: Higher Plants of California (Baldwin et al. 2012) for plants, the American Ornithologists' Union (AOU) Checklist of North and Middle American Birds (AOU 2015) for birds, a Complete List of Amphibian, Reptile, Bird and Mammal Species in California (CDFW 2016b) for other vertebrate wildlife, and the CDFW Special Animals List (CDFW 2016c) for invertebrates.

4 EXISTING CONDITIONS

The project substation site is located approximately 5 miles east of Paso Robles. Topography in the vicinity of the project substation site is primarily composed of rolling hills interspersed with small creeks and swales. Elevations in the vicinity of the project substation site range between approximately 880 and 1,000 feet above mean sea level.



San Luis Obispo County has a Mediterranean climate with warm to hot, dry summers and mild to cool, wet winters. The coastal climate is generally mild with average temperatures ranging from 45 to 70 degrees Fahrenheit (°F). Inland temperatures are much more variable with average temperatures ranging from 35 to 93°F. Precipitation in the region also varies spatially and temporally with increasing precipitation typically occurring near the coast. Average annual rainfall in the vicinity of the project substation site is 12.85 inches with approximately 90% of the rain falling between November and April. Average monthly rainfall in the summer months is significantly lower than the winter months only averaging about 0.2 inches per month between May and October. The above temperature and precipitation data is based on mean monthly data from the National Oceanic and Atmospheric Administration (NOAA) Paso Robles Municipal Airport, California climate station (COOP:046742), located approximately 2.5 miles northwest of the project substation site for the period between 1944–2015 (NOAA 2016).

4.1 Soils

Soil type descriptions were queried using Official Soil Series Descriptions (OSDs). Site-specific soil data was queried using the USDA Web Soil Survey database (NRCS 2016b). Soil types in the project substation site include the following (refer to Figure 3):

- Arbuckle-Positas complex, 9 to 15 percent slopes
- Arbuckle-San Ysidro complex, 2 to 9 percent slopes (hydric)
- Nacimiento-Los Osos complex, 9 to 30 percent slopes
- Ayar and Diablo soils, 9 to 15 percent slopes

Figure 3. Soil Units Map

Arbuckle soils are very deep, well-drained soils that are formed in alluvial materials from mainly conglomerate and metasedimentary rocks. Arbuckle soils occur on low terraces at elevations of 27 to 610 meters and have slopes of 0 to 75 percent. They typically occur in dry, subhumid, mesothermal climates with hot dry summers and cool moist winters. Vegetation communities on these soils are mainly annual grasses and forbs either alone or as an understory of blue oak trees (*Quercus douglasii*). Many areas with Arbuckle soils are used for dryland and irrigated orchards, irrigated row and field crops, dry farmed grain and for rangeland grazing.

Positas soils consist of deep and very deep, moderately well-drained soils that formed in alluvial material from mixed rock sources. These soils typically occur on stream terraces at elevations of 200 to 1,600 feet and have slopes of 2 to 75 percent. These soils occur in dry, subhumid, mesothermal climates with hot, dry summers and cool, moist winters. Vegetation communities on these soils are typically annual grasses, forbs, and scattered oaks. Many areas with Positas soils are primarily used for rangeland grazing, but some are also used for dryland grain crops and vineyards.

San Ysidro soils consist of deep, moderately well-drained soils that are formed in alluvium from sedimentary rocks. These soils occur on old, low terraces in elevations of less than 1,500 feet and have slopes of 0 to 9 percent. These soils occur in dry, subhumid, mesothermal climates with hot, dry summers and cool, moist winters. Vegetation communities associated with these soils are typically annual grasses and forbs. These soils are typically used for growing dryland grains, dryland pasture, and shallow rooted row crops.

Nacimiento soils consist of moderately deep, well-drained soils that formed in material weathered from calcareous shale and sandstone. These soils occur on rolling uplands in elevations of 50 to 4,800 feet and have mostly complex slopes of 9 to 75 percent. These soils typically occur in dry, subhumid, mesothermal climates with warm dry summers and cool moist winters. Vegetation communities associated with this soil type are annual grasses and forbs with coast live oaks (*Quercus agrifolia*) and other trees in some places. These soil types are often used for rangeland grazing and dry farmed grain.

Los Osos soils consist of moderately deep, well-drained soils that formed in material weathered from sandstone and shale. These soils occur on uplands at elevations of 100 to 3,500 feet and have slopes of 5 to 75 percent. These soils typically occur in dry, subhumid, mesothermal climates with warm dry summers and cool moist winters. Vegetation communities associated with this soil type are mostly annual grasses and forbs with some perennial grasses, coastal sagebrush, and live oaks. These soil types are typically used for rangeland grazing, but some are used for grain crops and sudangrass pasture.

Ayar soils consist of deep or very deep, well-drained soils that formed in material weathered from decomposed alkaline shales and sandstone on rolling hills. This soil type typically occurs on hills at elevations of 46 to 1,066 meters and a slope of 5 to 75 percent. This soil type occurs in dry, subhumid, mesothermal climates. Natural vegetation is annual grasses and forbs with a few blue oak, live oak, and white oak (*Quercus alba*) stands. This soil type is most commonly used for livestock grazing, but some areas are used for dry farmed grain, almonds, and apricots.

Diablo soils area typically well-drained soils that formed from weathered shale, sandstone, and consolidated sediments with minor areas of tuffaceous material. This soil type typically occurs on rolling to steep uplands in elevations of 25 to 3,000 feet and slopes 5 to 50 percent. Vegetation communities typically occurring on this soil type are annual grasses and forbs. This soil type is most commonly used for grazing and for production of dry farmed grain, mainly barley.

4.2 Habitats and Natural Communities

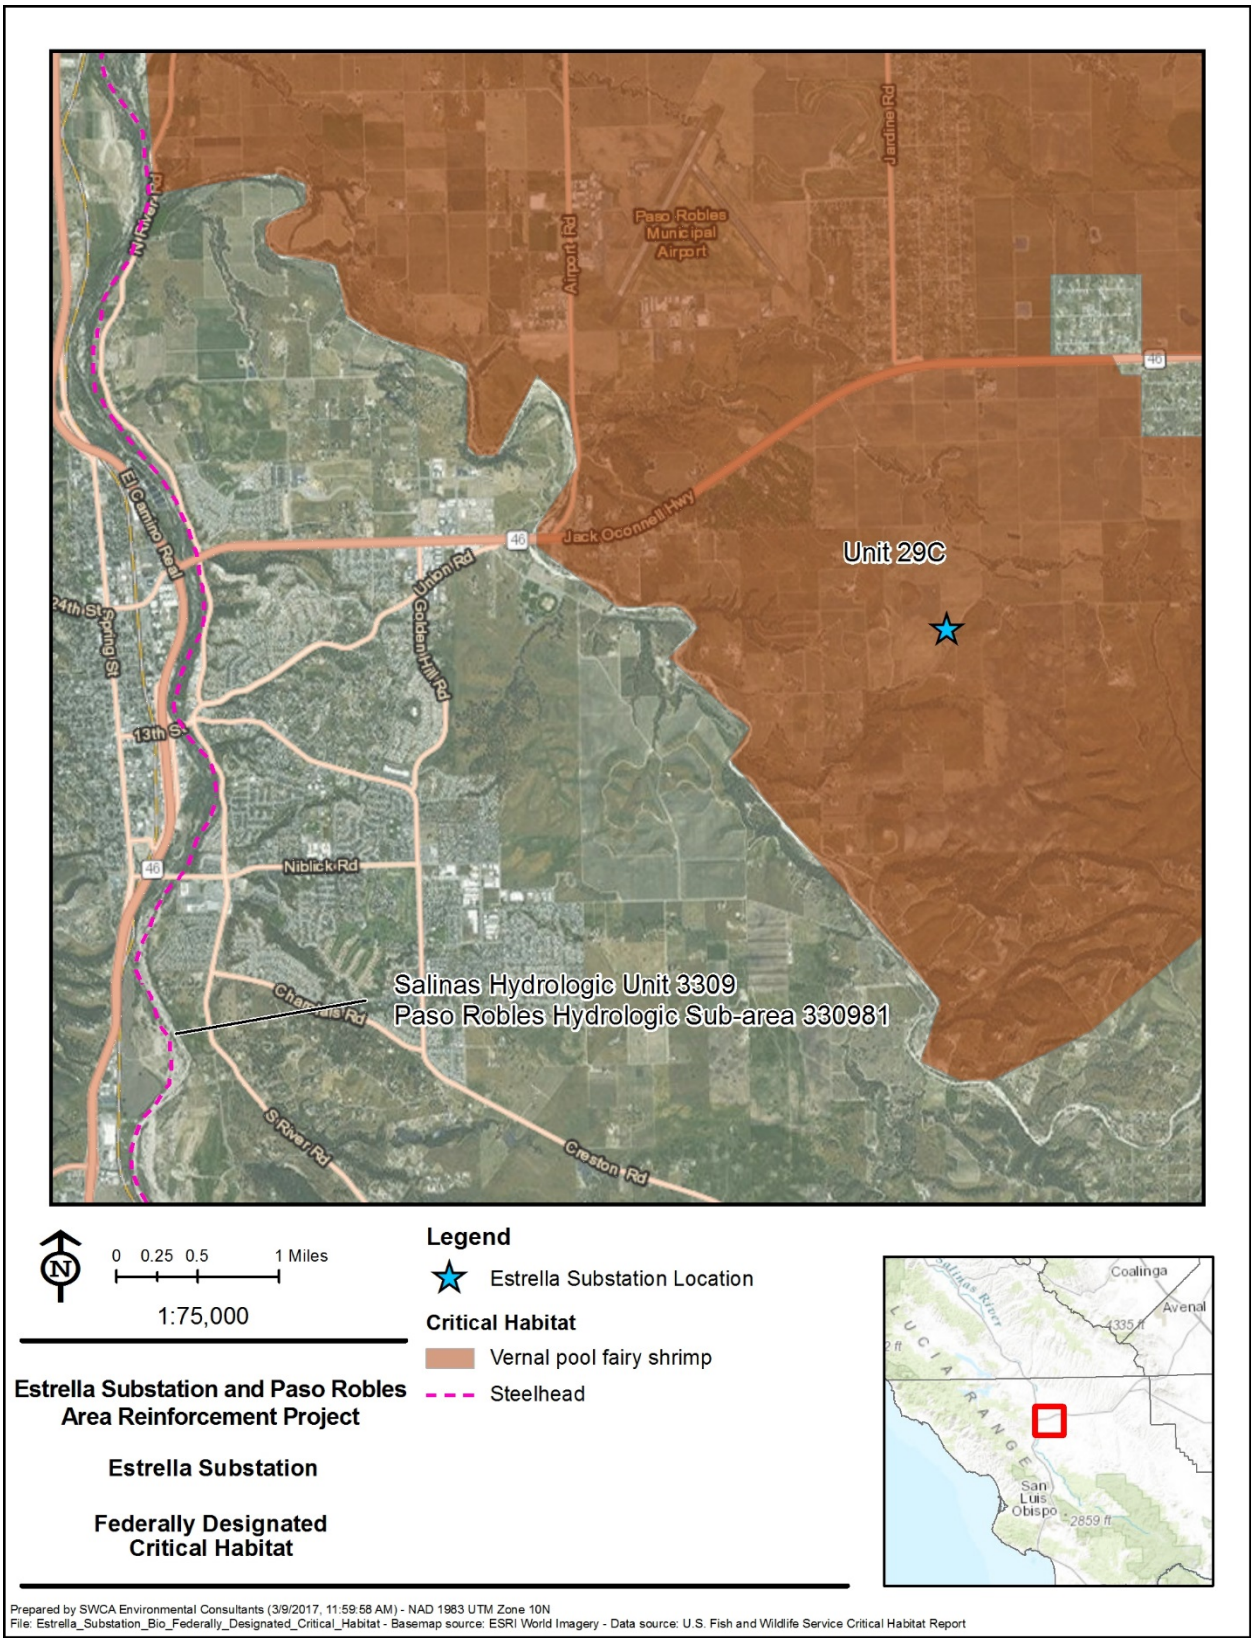
4.2.1 Critical Habitat

The BSA is located within federally designated critical habitat Unit 29C for vernal pool fairy shrimp (USFWS 2006, 2016a) (Figure 4). Federally designated vernal pool fairy shrimp critical habitat Unit 29C, Central Coast Ranges, is located in San Luis Obispo County, northeast of Paso Robles. Vernal pool fairy shrimp are known to currently occupy this region. Unit 29C contains the following habitat constituents that are required to support this species: mound and inter-mound topography within a matrix of surrounding upland habitat, which provide for cyst dispersal and adequate pool hydroperiods, and vernal pool wetland features within a matrix of upland habitat, which provide for food, shelter, hatching, growth, and reproduction (USFWS 2006).

No habitat constituents required for the growth and survival of vernal pool fairy shrimp were observed in the BSA. The landscape surrounding the project substation site has been fragmented and converted to primarily agricultural uses. Existing access roads to the project substation site occur entirely in uplands, and the CNDDB historic records and a review of recent aerial imagery show no occurrences or vernal pools within the parcel. There are seasonal drainages in the vicinity of the project substation site (Figure 5); however, these swales appear to only convey surface waters during rain events. Due to the fact that this species requires ponded water to complete their life cycle, suitable habitat for this species is absent from the BSA.

4.2.2 Vegetation Communities and Cover Types

The landscape within and surrounding the BSA is composed of agricultural, blue oak woodlands, nonnative grasslands, ruderal, and urban/developed areas. The project substation site primarily consists of active viticulture and is subject to disking and mowing. At the time of the March 2016 field surveys, the vineyards contained an understory of nonnative and native annual grasses and forbs. The project substation site is bound by active agricultural fields on all sides with intermittent blue oak and valley oak (*Quercus lobata*) trees scattered throughout the agricultural fields. Union Road, a moderately trafficked roadway, parallels the southeast perimeter of the project substation site, with additional agricultural areas and nonnative grassland habitat to the southeast. A residence surrounded by ornamental trees and vegetation is located in the southwest corner of the BSA, and Dry Creek, an ephemeral creek, is located in the northeast corner of the BSA. Dry Creek is surrounded by a narrow band of blue oak woodland habitat occurring along the riparian corridor. Of the vegetation communities present in the BSA, only one—blue oak woodland— is considered sensitive by CDFW. None of the vegetation communities present within the project substation site are considered sensitive. Refer to Figure 6 for a map depicting the vegetation communities in relation to the project substation site. The following information provides descriptions of the various vegetation communities observed in the BSA.



4.2.2.1 AGRICULTURAL

Agricultural habitat is identified by active cultivation and planting of crops in an area. The main form of agriculture in the BSA is grape vineyards. Agricultural areas typically provide low habitat value for sensitive plants and wildlife species. Approximately 63 acres of agricultural lands were observed in the BSA.

4.2.2.2 BLUE OAK WOODLAND

Blue oak woodlands are typically dominated by blue oak trees, yet often include other oak species as well as gray pine (*Pinus sabiana*). Blue oak woodlands range from open savannas to dense woodlands, and often contain an understory of grasses and herbs. This habitat type usually contains well-drained soils and occurs below 4,000 feet (Holland 1986).

Figure 4. Federally Designated Critical Habitat

A small area (1.5 acres) consisting of blue oak woodland habitat occurs in the northeast corner of the BSA along Dry Creek. Additionally, a few scattered blue oak trees are located in the southeast corner of the BSA along Union Road (Figure 6). There is no blue oak woodland habitat located within the project substation site.

4.2.2.3 NONNATIVE GRASSLAND

Nonnative grasslands consist of dense to sparse cover of annual grasses generally less than 1 meter high and are dominated by nonnative grasses and forbs, including soft chess (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), slender wild oats (*Avena barbata*), cheatgrass (*Bromus tectorum*), red brome (*Bromus madritensis*), red-stemmed filaree (*Erodium cicutarium*), and short-pod mustard (*Hirschfeldia incana*). Native species may include western ragweed (*Ambrosia psilostachya*), lupines (*Lupinus* spp.), and doveweed (*Croton setigerus*) (Holland 1986).

Approximately 7 acres of nonnative grassland habitat were observed throughout the BSA. Nonnative grassland habitat occurs along the southern edge of the BSA, outside of the project substation site.

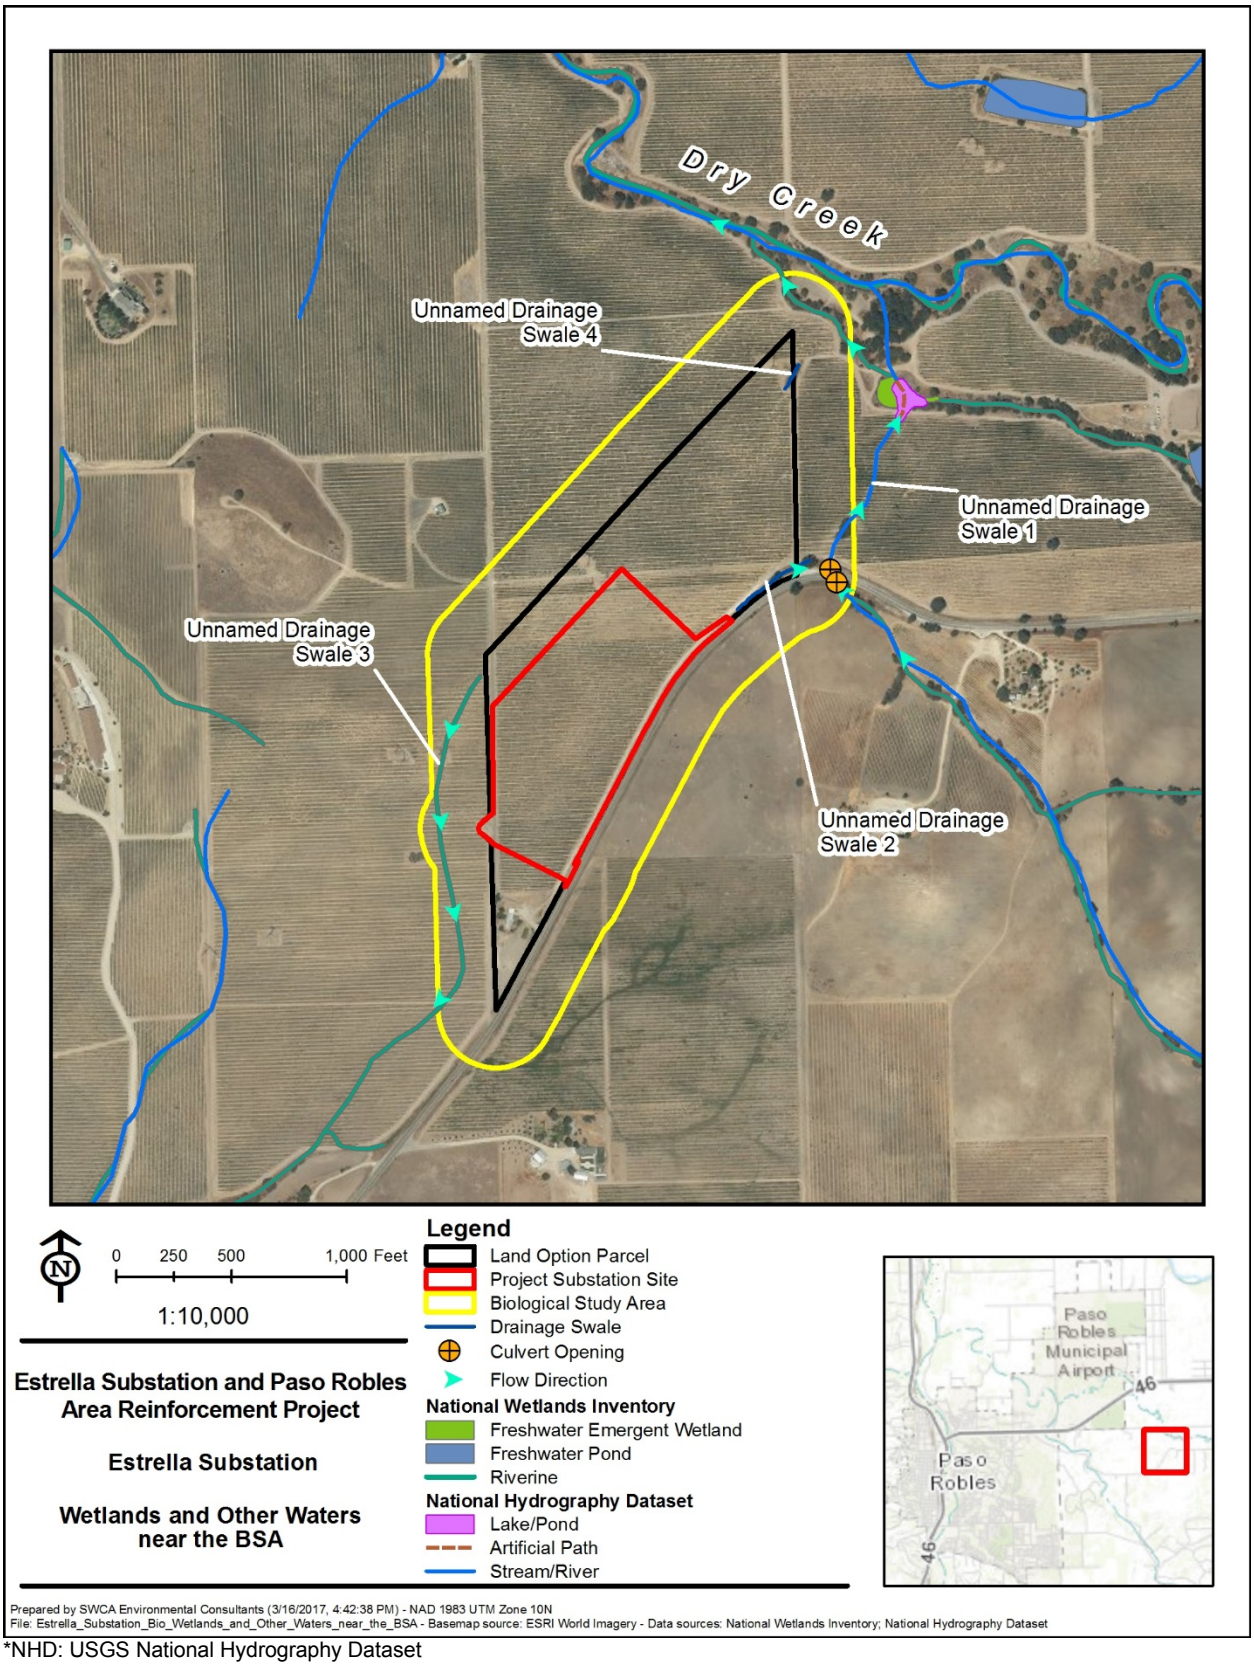
4.2.2.4 RUDERAL

Ruderal habitat areas are often defined as occurring along road edges and other highly disturbed areas. Typically, species dominating ruderal habitat areas are able to quickly colonize disturbed areas due to their high rates of seed dispersal and fast growth. Ruderal areas are typically dominated by nonnative vegetation, but some native species can also occur.

Approximately 8 acres of ruderal habitat occur within the BSA, generally along the areas surrounding the residence, roadside edges, farm equipment staging areas, and transmission tower footings.

4.2.2.5 URBAN/DEVELOPED

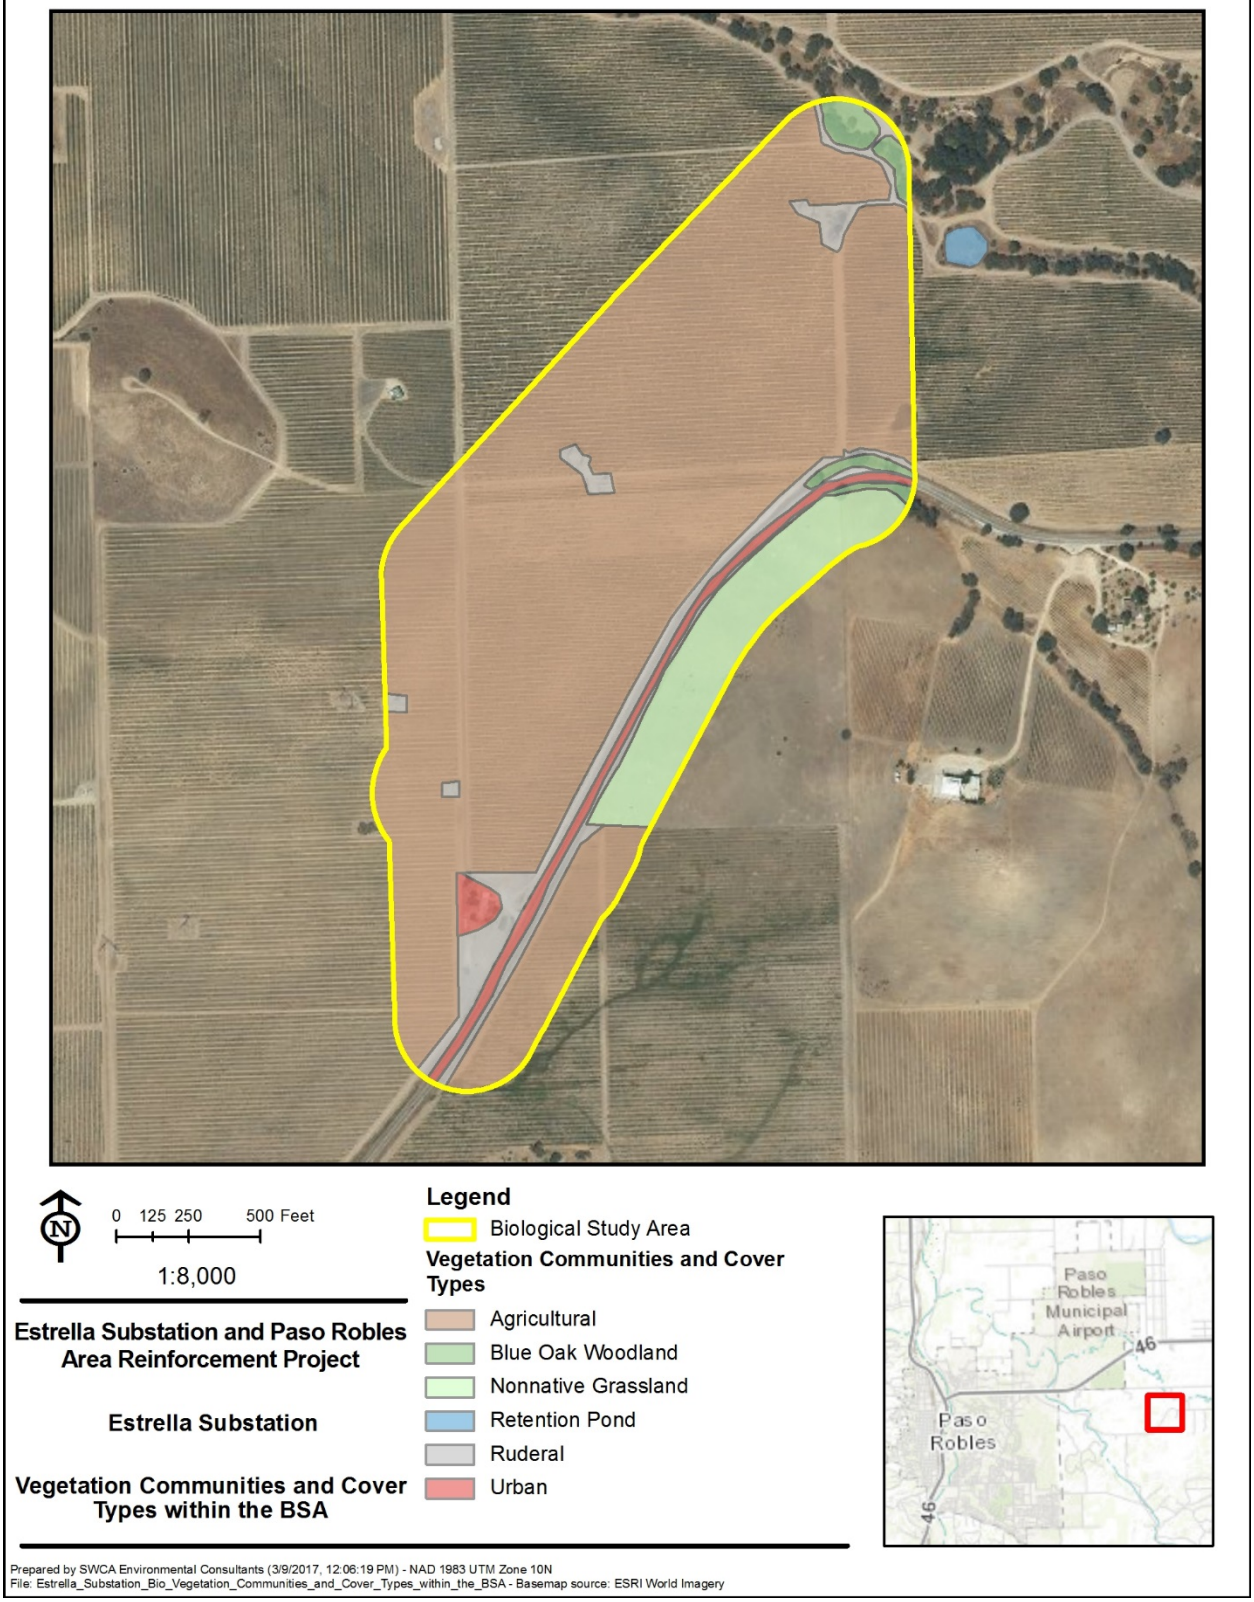
Urban/developed habitat is found in regularly and highly disturbed areas, including areas that have been developed and/or include landscaping such as trees, shrubs, ornamental plants, and lawns. Vegetation density, canopy cover, and species composition will vary based on the structure and composition of the developed area. Vegetation may include native or exotic species, or a combination of both.



Approximately 3 acres of urban/developed lands occur in the BSA. Urban cover occurs in portions of the BSA no longer covered by vegetation. Roads, permanent facilities, and other sites paved or built upon that are devoid of vegetation. This cover type also occurs in the southwest corner of the BSA at an established residence.

4.3 Drainages and Water Features

The project substation site is located within the Huerhuero Creek watershed. The Huerhuero watershed is located in the eastern portion of San Luis Obispo's North County region. The headwaters of Huerhuero Creek occur in the Coast Ranges just south of Creston. Huerhuero Creek flows to Salinas River in Paso Robles, approximately 5 miles east of the project substation site.



An ephemeral creek, Dry Creek, is located in the northeast corner of the BSA, approximately 1,500 feet north of the project substation site. Dry Creek is surrounded by blue oak woodland habitat and is likely considered jurisdictional by USACE, CDFW, and RWQCB.

Figure 5. Wetlands and Other Waters near the BSA

*NHD: USGS National Hydrography Dataset

Figure 6. Vegetation Communities and Cover Types within the BSA

The eastern side of the BSA is bordered by localized drainage swales, which appear to flow in a generally northerly direction towards Dry Creek. One drainage swale (Figure 5, unnamed drainage swale 1) runs north to south along the eastern side of the BSA, and appears to convey surface water from Union Road during rain events. The other drainage swale located on the southeastern side of the BSA (Figure 5, unnamed drainage swale 2) runs east to west along the north side of Union Road. This swale appears to also convey surface water running off Union Road toward Dry Creek. A third drainage swale on the north side of the BSA (Figure 5, unnamed drainage swale 4) appears to convey surface water captured due to the rolling hillsides that dominate the BSA, in a northerly direction towards Dry Creek. On the west side of the BSA, a localized drainage swale (Figure 5, unnamed drainage swale 3) runs north to south. This drainage swale appears to convey surface waters in a generally southerly direction toward tributaries of the Salinas River. Drainage swales identified during the field surveys did not contain a defined bed, bank, or OHWM. All localized drainages occur outside of the project substation site.

4.3.1 Jurisdictional Waters

Dry Creek, located in the northeast corner of the BSA, may be considered jurisdictional by USACE, CDFW, and/or RWQCB based on the presence of a defined bed and bank, OHWM, and connection to downstream waters of the United States. No additional potentially jurisdictional features are located within the BSA.

4.4 Sensitive Species

All species identified during the literature review were evaluated for their potential to occur within the BSA. Biologists examined these records and made determinations during reconnaissance-level surveys. All plants and wildlife encountered during reconnaissance-level surveys were recorded. A complete list of species observed is located in Appendices A and B.

4.4.1 Special-Status Plants

Biologists and botanists queried the CNDDB and CNPS databases to review recent accounts of special-status plants within the nine USGS 7.5-minute topographic quadrangles at and surrounding the project substation site. Local expert botanist, Dr. Dave Keil, also provided expertise regarding special-status species that were historically recorded in the region (D. Keil, personal communication, June 3, 2016). Based on the preliminary review, biologists and botanists compiled a list of special-status plants, as defined by CDFW's Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities (2009), which were likely to occur in the BSA based on site-specific conditions (soils, geology, topography, elevation, and associated plant communities). The field surveys were floristic in nature, identifying each plant to the taxonomic level. Surveys were conducted in March and May 2016 following a season of good rainfall (approximately 88% of the average) (National Atmospheric and Oceanic Administration 2016), providing optimal conditions for the detection of rare plants. The surveys were conducted over a range of bloom periods to capture the flowering period of all special-status plants with a likelihood for occurrence in the BSA.

No federal, state, or CNPS 1 or 2 listed special-status plant species were observed in the BSA. A complete list of plants identified during the surveys is located in Appendix A, Flora Compendium. Twenty-one special-status plants have occurrence records within the nine USGS 7.5-minute topographic quadrangles at and surrounding the project substation site. One federally listed species—spreading navarretia (*Navarretia fossalis*) was identified in the records search; however, its known range occurs outside of the BSA (D. Keil, personal communication, June 3, 2016). This species was therefore determined to be unlikely to occur in the BSA. No other federally or state listed species were returned in the records search.

Due to site-specific conditions, it was determined that six species have potential to occur and four species are unlikely to occur in the BSA. The remaining 11 plants were determined to be absent from the BSA

either because suitable habitat does not exist in the BSA, the species is restricted to or known to be present only within a specific area outside of the BSA, or focused or protocol-level surveys did not detect the species. Species that were determined to be unlikely to occur (dwarf calycadenia [*Calycadenia villosa*], Hall's tarplant [*Deinandra halliana*], spreading navarretia, and shining navarretia [*Navarretia nigelliformis ssp. radians*]) or were absent from the BSA are not discussed further in this report. Species that were determined to have potential to occur within the BSA are discussed below. Special-status plant species occurrences recorded in the CNDDB (CDFW 2016a) are depicted in Figure 7.

Table 1. Sensitive Plant Species Potential for Occurrence within the BSA

Common Name *Scientific Name*	Status Federal / State / CRPR	Habitat Associations	Likelihood to Occur in the BSA
round-leaved filaree *California macrophylla*	--/--/CRPR 1B.2	Annual herb that occurs in open sites, scrub, vertic clay, and occasionally serpentine soils in valley grasslands and foothill woodlands. Blooming period: March–July. Elevation: <1,200 meters.	**Potential to occur.** Grassland to the south of the BSA and on the north side near Dry Creek may provide suitable habitat for this species. One CNDDB occurrence was recorded approximately 4.6 miles north of Estrella Substation; however, this record dates back to 1937. Species not observed in the BSA during surveys conducted in the appropriate season.
La Panza mariposa lily *Calochortus simulans*	--/--/CRPR 1B.3	Perennial bulbiferous herb that occurs in meadow habitats found in chaparral, valley grassland, and foothill woodland communities. Associated with sandy (often granitic) soils. Blooming period: April–July. Elevation: 380–1,150 meters.	**Potential to occur.** Grassland to the south of the BSA and on the north side near Dry Creek could provide habitat for this species. One CNDDB occurrence was recorded within 5 miles of the project in 2008. Species not observed in the BSA during surveys conducted in the appropriate season.
Hardham's evening-primrose *Camissoniopsis hardhamiae*	-- /--/CRPR 1B.2	Annual herb that is typically found in sandy soil, limestone, and disturbed oak woodland. Blooming period: March–May. Elevation: 140–945 meters.	**Potential to occur.** Blue oak woodlands near Dry Creek could provide habitat for this species. No CNDDB occurrences have been recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
San Luis Obispo owl's-clover *Castilleja densiflora* var. *obispoensis*	--/--/ CRPR 1B.2	Annual herb that occurs in coastal grassland. Blooming period: March–June. Elevation: 10–430 meters.	**Potential to occur.** Grassland to the south of the BSA and on the north side near Dry Creek could provide habitat for this species. One CNDDB occurrence was recorded within 5 miles of the project in 2008. Species not observed in the BSA during surveys conducted in the appropriate season.

Table 1. Sensitive Plant Species Potential for Occurrence within the BSA

Common Name *Scientific Name*	Status Federal / State / CRPR	Habitat Associations	Likelihood to Occur in the BSA
Lemmon's jewelflower *Caulanthus lemmonii*	--/--/CRPR 1B.2	Annual herb that occurs in grassland, chaparral, and scrub habitat. Blooming period: February–May. Elevation: 80–1,580 meters.	**Potential to occur.** Grassland to the south of the BSA and on the north side near Dry Creek could provide habitat for this species. Five CNDDB occurrences were recorded between 1935 and 1960, approximately 5 miles north of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
woodland woolythreads *Monolopia gracilens*	--/--/CRPR 1B.2	Annual herb that occurs in serpentine grassland, open chaparral, and oak woodland. Blooming period: February–July. Elevation: 100–1,200 meters.	**Potential to occur.** Grassland to the south may provide habitat for this species. No CNDDB occurrences have been recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.

[1] Species distribution data compiled based on CNPS and CNDDB searches of USGS 7.5-quadrangles— Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel. Additionally, local knowledge of species occurrences was incorporated. Blooming periods are based on CNPS data.
[2] Refer to Section 4.4.2.1 for the discussions on the likelihood occurrence in the project substation site.

Status Codes:
-- = No status
FE = Federal Endangered
FT = Federal Threatened
SE = State Endangered
ST = State Threatened
SC = State Candidate
SR = State Rare

California Rare Plant Ranks (CRPR):
1B = Rare, Threatened or Endangered in California and elsewhere
2 = Rare, Threatened or Endangered in California, but more common elsewhere

CRPR Threat Ranks:
0.1 = seriously threatened in California
0.2 = fairly threatened in California
0.3 = not very threatened in California

4.4.1.1 ROUND-LEAVED FILAREE

Round-leaved filaree (*California macrophylla*) is known to occur in valley grassland and foothill woodland communities similar to those observed in the BSA. Although this species was not detected during the 2016 plant surveys, the biologists had restricted access to the nonnative grassland habitat on the southeast side of the BSA outside of the project substation site. This area may provide suitable habitat for this species. One CNDDB occurrence was recorded approximately 4.6 miles north of the project substation site; however, this record dates back to 1937. Due to the presence of potentially suitable habitat and occurrences within 5 miles of the site, this species potential to occur within the BSA.

4.4.1.2 LA PANZA MARIPOSA LILY

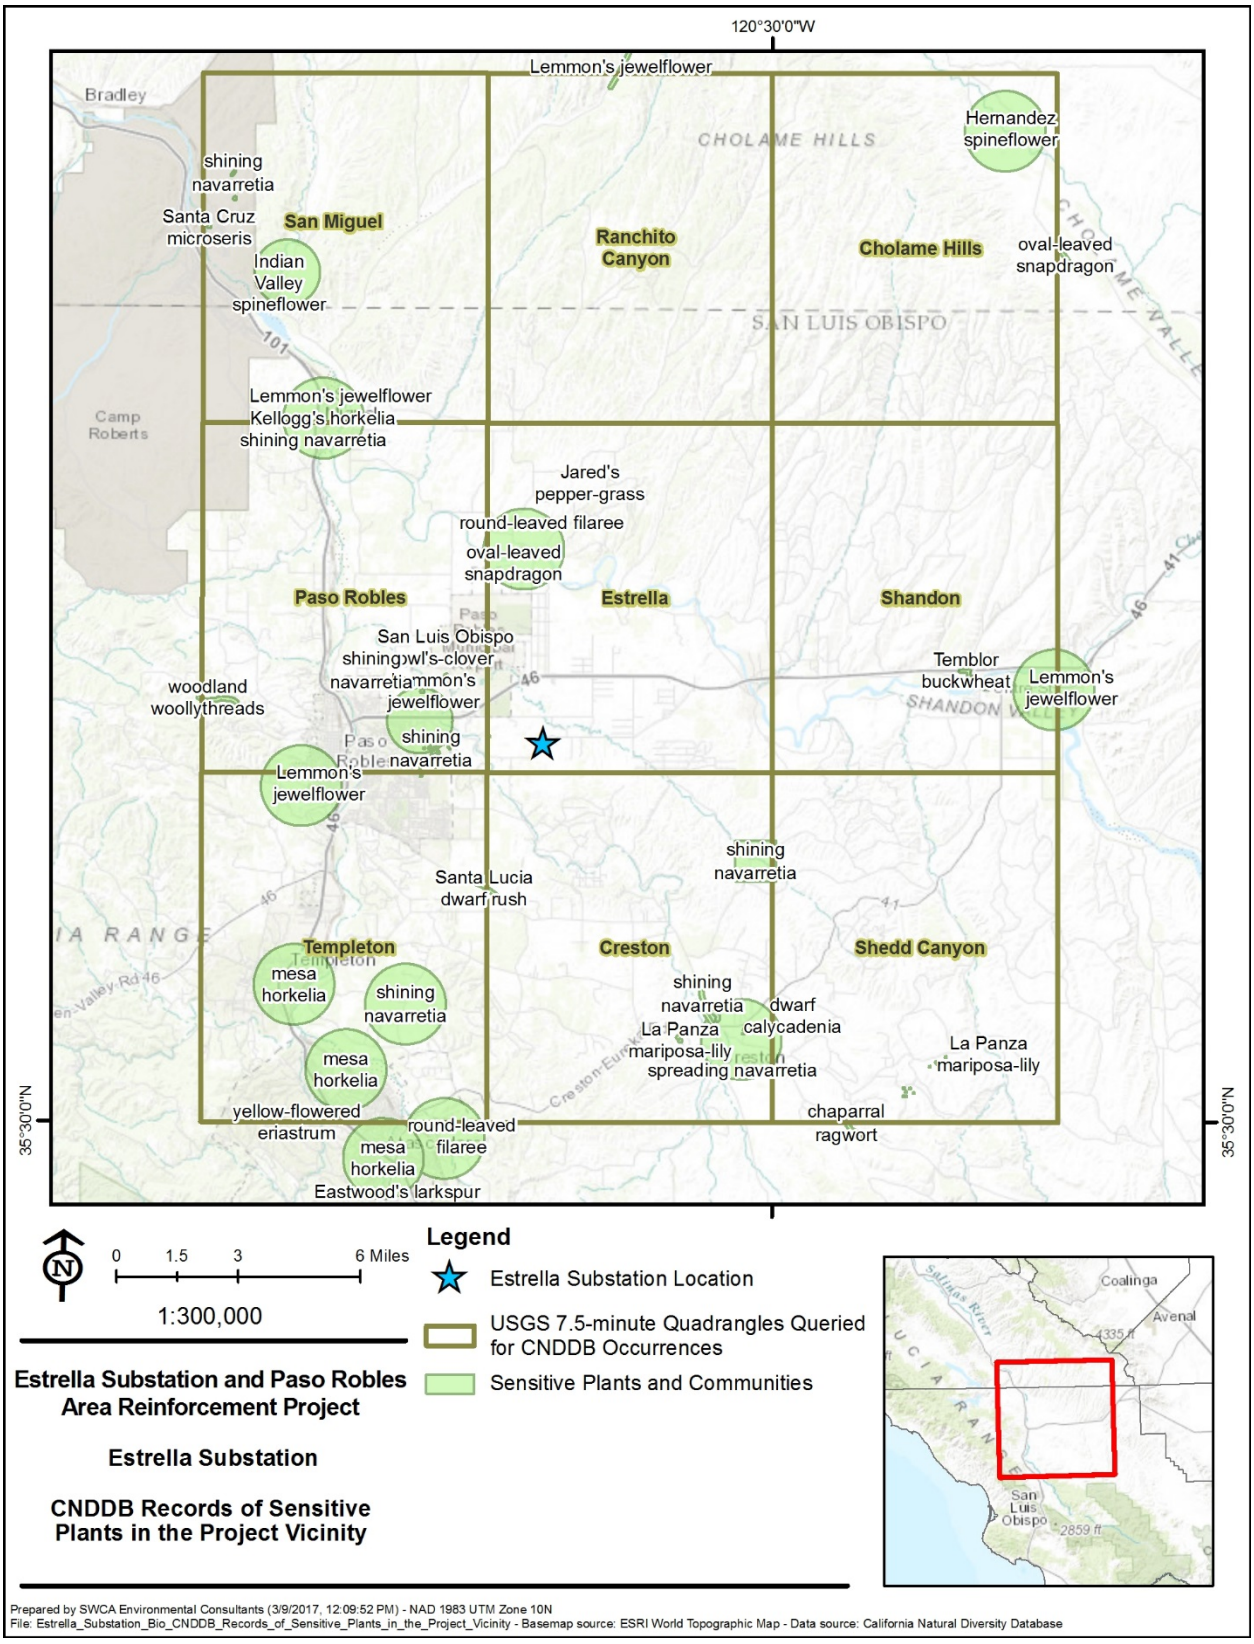
La Panza mariposa lily (*Calochortus simulans*) is known to occur in sandy soils in valley grasslands and foothill woodlands. This species was not observed during the 2016 plant surveys. Nonnative grassland habitat on the southeast side of the BSA outside of the project substation site may provide suitable habitat for this species. Due to restricted access, this area was not surveyed during the 2016 field surveys. The most recent occurrence of this species was recorded in 2008 within 5 miles of the BSA (CDFW 2016a). Due to the presence of potentially suitable habitat, and occurrences within 5 miles of the project, this species has potential to occur within the BSA.

4.4.1.3 HARDHAM'S EVENING-PRIMROSE

Hardham's evening-primrose (*Camissoniopsis hardhamiae*) is an annual herb that is known to occur on sandy soils or limestone in chaparral and oak woodlands. The BSA is located within the range of the species, and suitable habitat is present within the BSA. However, no records of occurrence are located within 5 miles the BSA. Given the above, Hardham's evening primrose has the potential to occur in the BSA, primarily within blue oak woodlands located along Dry Creek on the north side of the BSA.

4.4.1.4 SAN LUIS OBISPO OWL'S-CLOVER

San Luis Obispo owl's-clover (*Castilleja densiflora* var. *obispoensis)* is known to occur in valley and foothill grasslands. Although this species was not detected during the 2016 plant surveys, the biologists had restricted access to the nonnative grassland habitat on the southeast side of the BSA outside of the project substation site. This area may provide suitable habitat for this species. One CNDDB occurrence was recorded in 2005 within 5 miles of the project substation site. Due to the presence of potentially suitable habitat, and occurrences within 5 miles of the project, this species has potential to occur within the BSA.



4.4.1.5 LEMMON'S JEWELFLOWER

Lemmon's jewelflower (*Caulanthus lemmonii*) is known to occur in grassland, chaparral, and scrub habitat. Although this species was not detected during the 2016 plant surveys, the biologists had restricted access to the nonnative grassland habitat on the southeast side of the BSA outside of the project substation site. This area may provide suitable habitat for this species. Five CNDDB occurrences were recorded between 1935 and 1960, approximately 5 miles north of the project substation site. Due to the presence of potentially suitable habitat, and occurrences within 5 miles of the project, this species has potential to occur within the BSA.

4.4.1.6 WOODLAND WOOLLYTHREADS

Woodland woollythreads (*Monolopia gracilens*) is known to occur in grasslands and oak woodlands similar to those observed in the BSA; therefore, it was determined this species has potential to occur. Although this species was not detected during the 2016 plant surveys, the biologists had restricted access to the nonnative grassland habitat on the southeast side of the BSA outside of the project substation site. This area may provide suitable habitat for this species. No CNDDB occurrences have been recorded within 5 miles of the project.

Figure 7. CNDDB Records of Sensitive Plants in the Project Vicinity

4.4.2 Special-Status Animals

Biologists conducted reconnaissance-level surveys in the BSA to assess the potential for special-status wildlife including those listed by federal and state agencies and others based on available data. The data evaluated included USFWS and CNDDB Species List databases, as well as published and unpublished technical reports and peer-reviewed literature. Reconnaissance-level surveys included documentation of animals, vegetation communities, and land cover types. Habitat was evaluated for potential to support those special-status species identified during the desktop review, and detailed notes and photographs (Appendix C) were taken to support determinations of the potential for those species to occur within the BSA. The BSA was examined for presence or signs of occupation by special-status species (e.g., footprints, scat, feathers, or burrows) and auditory information (e.g., specific vocalizations of birds). Binoculars were also used to facilitate identification of species.

A complete list of wildlife identified during the surveys is located in Appendix B, Fauna Compendium. Twenty-eight special-status animals have CNDDB occurrence records within the nine USGS 7.5-minute topographic quadrangles at and surrounding the project. Additional species were added to this analysis based on local knowledge, site conditions, and eBird queries of the area. Due to site-specific conditions, it was determined that five animals are likely to occur and nine animals have potential to occur (Table 3). The remaining 14 animals were determined to be either unlikely to occur or were absent from the BSA based on the lack of suitable habitat or because the BSA is located outside of the species range. Species that were determined to be unlikely to occur (California tiger salamander [*Ambystoma californiense*], California red-legged frog [*Rana draytonii*] western spadefoot toad [*Spea hannmondii]*, Swainson's hawk [*Buteo swainsoni*], California condor [*Gymnogyps californianus*], bald eagle [*Haliaeetus leucocephalus*], Townsend's big-eared bat [*Corynorhinus townsendii*], Salinas pocket mouse [*Perognathus inornatus psammophilus*], and Tulare grasshopper mouse [*Onychomys torridus tularensis*]) or absent from the BSA are not discussed further in this report. Species that were determined to be present, seasonally present, have potential to occur, or are likely to occur within the BSA are discussed below. Special-status wildlife species occurrences recorded in the CNDDB (CDFW 2016a) are depicted in Figure 8.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA

Common Name Scientific Name	Status Federal / State / CDFW[2]	Habitat Associations	Likelihood to Occur in the BSA
REPTILES			
silvery legless lizard *Anniella pulchra pulchra*	--/--/SSC	Dune scrub, coastal scrub, chaparral, pine-oak woodland, oak woodland, and riparian woodland. Requires loose soil for burrowing, moisture, warmth, and plant cover. Burrows in washes, dune sand, loose soil near bases of slopes, and near permanent or temporary streams.	**Potential to occur.** Loose leaf litter and soft soils are present in blue oak woodlands in the BSA. No CNDDB occurrences have been recorded within 5 miles of the project.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA

Common Name Scientific Name	Status Federal / State / CDFW[2]	Habitat Associations	Likelihood to Occur in the BSA
San Joaquin coachwhip *Coluber flagellum ruddocki [=Masticophis flagellum ruddocki]*	--/--/SSC	Chaparral and scrub habitats but will also use adjacent grassland, oak savanna and woodland habitats; will inhabit abundant rodent burrows.	**Potential to occur.** Grassland habitat on the south side of the BSA may provide suitable habitat for this species. No CNDDB occurrences have been recorded within 5 miles of the project.
coast horned lizard *Phrynosoma blainvillii*	--/--/SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes; open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	**Likely to occur.** Dry Creek in the northeast corner of the BSA may provide suitable habitat for this species. One coast horned lizard was observed by biologists approximately 0.5 mile northeast of the project in Dry Creek in March 2016.
BIRDS			
golden eagle *Aquila chrysaetos*	--/--/FP; MBTA; BGEPA	Broad expanses of open country are required for foraging while nesting primarily occurs in rugged mountainous areas with large trees or on cliffs.	**Potential to occur.** Foraging and nesting habitat is present in the BSA; however, habitat within the substation footprint is marginal. One known nest location was identified 3 miles northwest of the substation.
burrowing owl *Athene cunicularia*	--/--/SSC; MBTA	Open, dry, annual, or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Uses rodent or other burrow for roosting and nesting cover.	**Potential to occur.** Grassland habitat on the south side of the BSA provides habitat for this species. No CNDDB occurrences have been recorded within 5 miles of the project.
northern harrier *Circus cyaneus*	--/--/SSC; MBTA	Frequents meadows, grasslands, open rangeland, desert sinks, and fresh and saltwater emergent wetlands; seldom found in wooded areas. Nests on the ground in dense vegetation patches such as willows, grasses, sedges, reeds, bulrushes, and cattails.	**Likely to occur.** Suitable foraging habitat observed in the BSA. Five sightings have been recorded between 2014 and 2016 within 5 miles of the project (eBird 2016). Grassland habitat present on the south side of the BSA may provide suitable nesting habitat for this species.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA

Common Name Scientific Name	Status Federal / State / CDFW[2]	Habitat Associations	Likelihood to Occur in the BSA
white-tailed kite *Elanus leucurus*	--/--/FP; MBTA	Yearlong resident in coastal and valley lowlands; rarely away from agricultural areas. Inhabits herbaceous and open staged moist habitats mostly in cismontane areas	**Potential to occur.** Suitable nesting and foraging habitat observed in the BSA. No CNDDB occurrences have been recorded within 5 miles of the project; however, one eBird occurrence was noted in 2006 approximately 5 miles west of the project.
loggerhead shrike *Lanius ludovicianus*	--/--/SSC; MBTA	Generally occurs in open country with scattered shrubs and trees. Sit on low perches to scan for prey (rodents, lizards, birds, and insects).	**Likely to occur.** Suitable foraging habitat observed within and adjacent to the project. No CNDDB occurrences were returned in the nine-quadrangle CNDDB search; however, multiple occurrences of this species have been reported between 1996 and 2014 within 5 miles of the BSA (eBird 2016).
purple martin *Progne subis*	--/--/SSC; MBTA	Uncommon to rare, local summer resident in a variety of wooded, low-elevation habitats. Forages over riparian areas, forest, and woodland, and found in a variety of open habitats in migration.	**Potential to occur.** Suitable nesting and foraging habitat was observed in the BSA. Two individuals were observed 4.5 miles northwest of the project in 1991 (eBird 2016).
yellow warbler *Setophaga petechia*	--/--/SSC;MBTA	Breed in shrubby thickets and woods near riparian areas and wetlands. Migrates south to Central and South America for the winter.	**Potential to occur.** Blue oak woodland on the north side of the BSA may provide foraging habitat for this species. Nesting habitat in the BSA is marginal. No CNDDB occurrences have been recorded within 5 miles of the project.
MAMMALS			
pallid bat *Antrozous pallidus*	--/--/SSC	True desert areas, moister oak woodlands, and redwood forests of coastal regions. At lower elevations, highly associated with oak woodlands and oak savanna.	**Potential to occur**. Potential day and night roost sites were observed within the BSA. No CNDDB occurrences were recorded within 5 miles of the project.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA

Common Name Scientific Name	Status Federal / State / CDFW[2]	Habitat Associations	Likelihood to Occur in the BSA
Monterey dusky-footed woodrat *Neotoma macrotis luciana*	--/--/SSC	Dense chaparral, coastal sage-scrub, pinyon-juniper, oak and riparian woodlands, and mixed coniferous forest habitat with well-developed understory in which to make its nest.	**Likely to occur**. Blue oak woodland habitat in the northeast corner of the BSA may provide suitable habitat for this species. One woodrat midden was observed outside of the BSA approximately 0.5 miles north of the project along Dry Creek.
American badger *Taxidea taxus*	--/--/SSC	Open grassland, chaparral, and oak woodland with friable soils. Needs sufficient food and open, uncultivated ground.	**Likely to occur**. Suitable habitat with a prey base is present within the BSA. No CNDDB occurrences were recorded within 5 miles of the project.
San Joaquin kit fox *Vulpes macrotis mutica*	FE/ST/--	Open, level areas with loose-textured soils supporting scattered, shrubby vegetation with little human disturbance represent suitable habitats for kit foxes. Some agricultural areas may support these foxes.	**Potential to occur**. Grassland habitat on the south side of the BSA may provide suitable foraging or den habitat for this species. Vineyards in the BSA also contain suitable burrows and prey base; however, with the presence of human and vehicular traffic associated with the vineyard, it is unlikely that San Joaquin kit fox would use the BSA for extended periods of time.

[1] Species distribution data compiled based on a CNDDB search of USGS 7.5-quadrangles— Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel. Additionally, local knowledge of species occurrences was incorporated.
[2]Listing status based on CDFW CNDDB State & Federally Listed Endangered & Threatened Animals of California List, April 2016.

Status Codes:
-- = No status
FE = Federal Endangered
FT = Federal Threatened
BGEPA = Bald and Golden Eagle Protection Act
SE = State Endangered
ST = State Threatened
SC = State Candidate
SCC = California Species of Special Concern;
FP = Fully Protected

4.4.2.1 SILVERY LEGLESS LIZARD

The BSA falls within the range of the silvery legless lizard (*Anniella pulchra pulchra*) and suitable habitat is present along the Dry Creek riparian area; however, no records of occurrence for this species have been recorded within 5 miles of the project. Due to the presence of suitable habitat within the BSA, this species has potential to occur. However, the substation footprint is entirely comprised of cultivated vineyard that is highly disturbed, so it is unlikely that this species would occur within the substation footprint.

4.4.2.2 SAN JOAQUIN COACHWHIP (WHIPSNAKE)

No San Joaquin whipsnake (*Coluber flagellum ruddocki [=Masticophis flagellum ruddocki]*) CNDDB occurrences have been recorded within 5 miles of the project. Due to the presence of grassland habitat on the south side of the BSA, and the presence of small mammal burrows throughout the BSA, there is potential for this species to occur.

4.4.2.3 COAST HORNED LIZARD

No coast horned lizard (*Phrynosoma blainvillii*) CNDDB occurrences have been recorded within 5 miles of the project; however, one individual was observed by biologists during the March 2016 field surveys approximately 0.5 mile northeast of the project substation site in Dry Creek. The riparian area in which the individual was observed is contiguous with the riparian corridor in the northeast corner of the BSA. Although it is likely that coast horned lizard occur in the BSA, the highly disturbed nature of the cultivated vineyards makes it unlikely for this species to occur within the substation footprint.

4.4.2.4 GOLDEN EAGLE

There is one CNDDB occurrence of a golden eagle (*Aquila chrysaetos*) nest recorded in 2006, approximately 3 miles northwest of the BSA. According to the CNDDB record, a golden eagle pair has been seen nesting at this particular location for at least 15 years. There are no suitable nesting trees present within the substation footprint; however, there may be suitable nesting trees in the northeast corner of the BSA as well as in the southeast corner along Union Road. Electrical transmission towers observed within the BSA may also provide nesting habitat for golden eagle. Vineyards occurring within the BSA provide low quality foraging habitat for this species; however, grassland habitat in the southeast portion of the BSA and larger more expansive spreads of grassland habitat to the southeast may provide quality foraging habitat for this species. Because of the presence of nesting and foraging habitat and proximity to documented occurrences, golden eagles were determined to have potential to occur in the BSA.

4.4.2.5 BURROWING OWL

No burrowing owl (*Athene cunicularia*) CNDDB occurrences have been recorded within 5 miles of the project. The grassland habitat present to the south of Union Road, along the south side of the BSA, has an abundance of small mammal burrows, which may provide suitable habitat for this species. Therefore, there is potential for burrowing owl to occur within the BSA. However, due to their preference for open areas (Burrowing Owl Conservation Network 2016) and the lack of CNDDB records within 5 miles of the substation footprint, it is unlikely that is species would inhabit the vineyard that comprises the substation footprint.

4.4.2.6 NORTHERN HARRIER

While no CNDDB records were listed in the nine-quadrangle CNDDB search, four northern harrier (*Circus cyaneus*) occurrences were recorded within approximately 5 miles of the BSA, dated between 2013 and 2016 (eBird 2016). While this species was not observed during field surveys, open grassland habitat on the south side of the BSA provides suitable foraging and nesting habitat for this species. Therefore, northern harrier was determined to be likely to occur in the BSA.

4.4.2.7 WHITE-TAILED KITE

While no CNDDB records were listed in the nine-quadrangle CNDDB search, one white-tailed kite (*Elanus leucurus*) occurrence was recorded on eBird in 2006, approximately 5 miles west of the project. While this species was not observed during the survey period, it has potential to occur because nesting and foraging habitat exists in the BSA and occurrences have been recorded in the area.

4.4.2.8 LOGGERHEAD SHRIKE

No loggerhead shrike (*Lanius ludovicianus*) CNDDB occurrences were returned in the nine-quadrangle CNDDB search; however, eight occurrences of this species were recorded in the eBird database between 1991 and 2015. This species is likely to occur because suitable nesting and foraging habitat exists in the BSA and occurrences have been recorded in the area.

4.4.2.9 PURPLE MARTIN

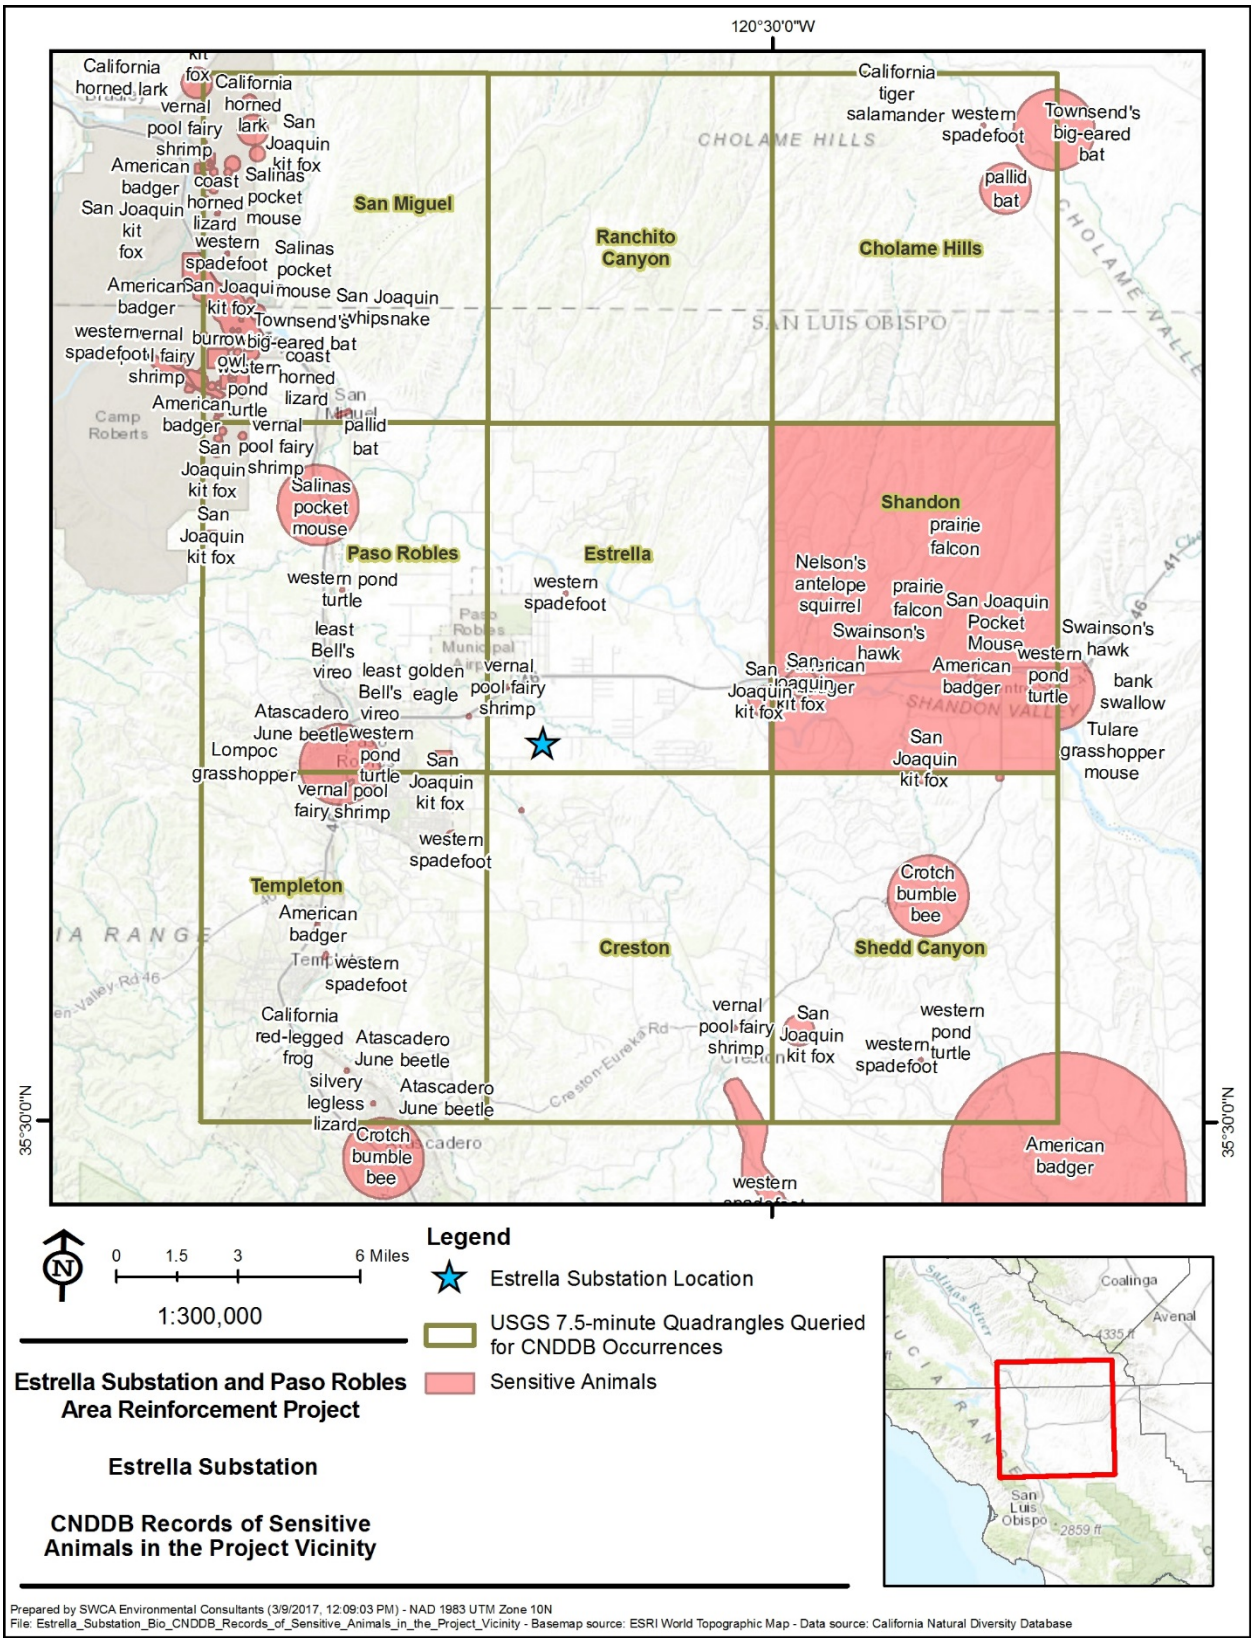
There are no purple martin (*Progne subis*) CNDDB occurrences recorded within the nine-quadrangle search; however, two individuals were observed approximately 4.5 miles northwest of the project near the intersection of Wellsona Road and Airport Road in 1991 (eBird 2016). Natural and urban landscapes in the BSA may provide suitable nesting and foraging habitat for this species. Because of the presence of suitable habitat and proximity to documented occurrences, purple martins have potential to occur in the BSA between April and August.

4.4.2.10 YELLOW WARBLER

No CNDDB occurrences for yellow warbler (*Setophaga petechia*) were returned in the nine-quadrangle CNDDB search; however, 20 occurrences were recorded in the eBird database between 1991 and 2014. Yellow warbler typically arrive in California in April to breed along watercourses and wetlands from mid-April into early August with a peak in June, and leave by October (CDFW 2016d). No suitable wetlands or willow thickets are present in the BSA; therefore, it is unlikely that this species would nest in the BSA. However, this species has been known to occur in woodland and forest habitats such as those present along Dry Creek in the northeast portion of the BSA. Because of the presence of suitable foraging habitat and proximity to documented occurrences, yellow warblers have potential to occur in the BSA between April and October.

4.4.2.11 PALLID BAT

No pallid bat (*Antrozous pallidus*) CNDDB occurrences have been recorded within 5 miles of the project. Blue oak woodlands and grasslands in the BSA may provide suitable roosting and foraging habitat for this species. Because of the presence of suitable roosting and foraging habitat, pallid bat have potential to occur in the BSA.



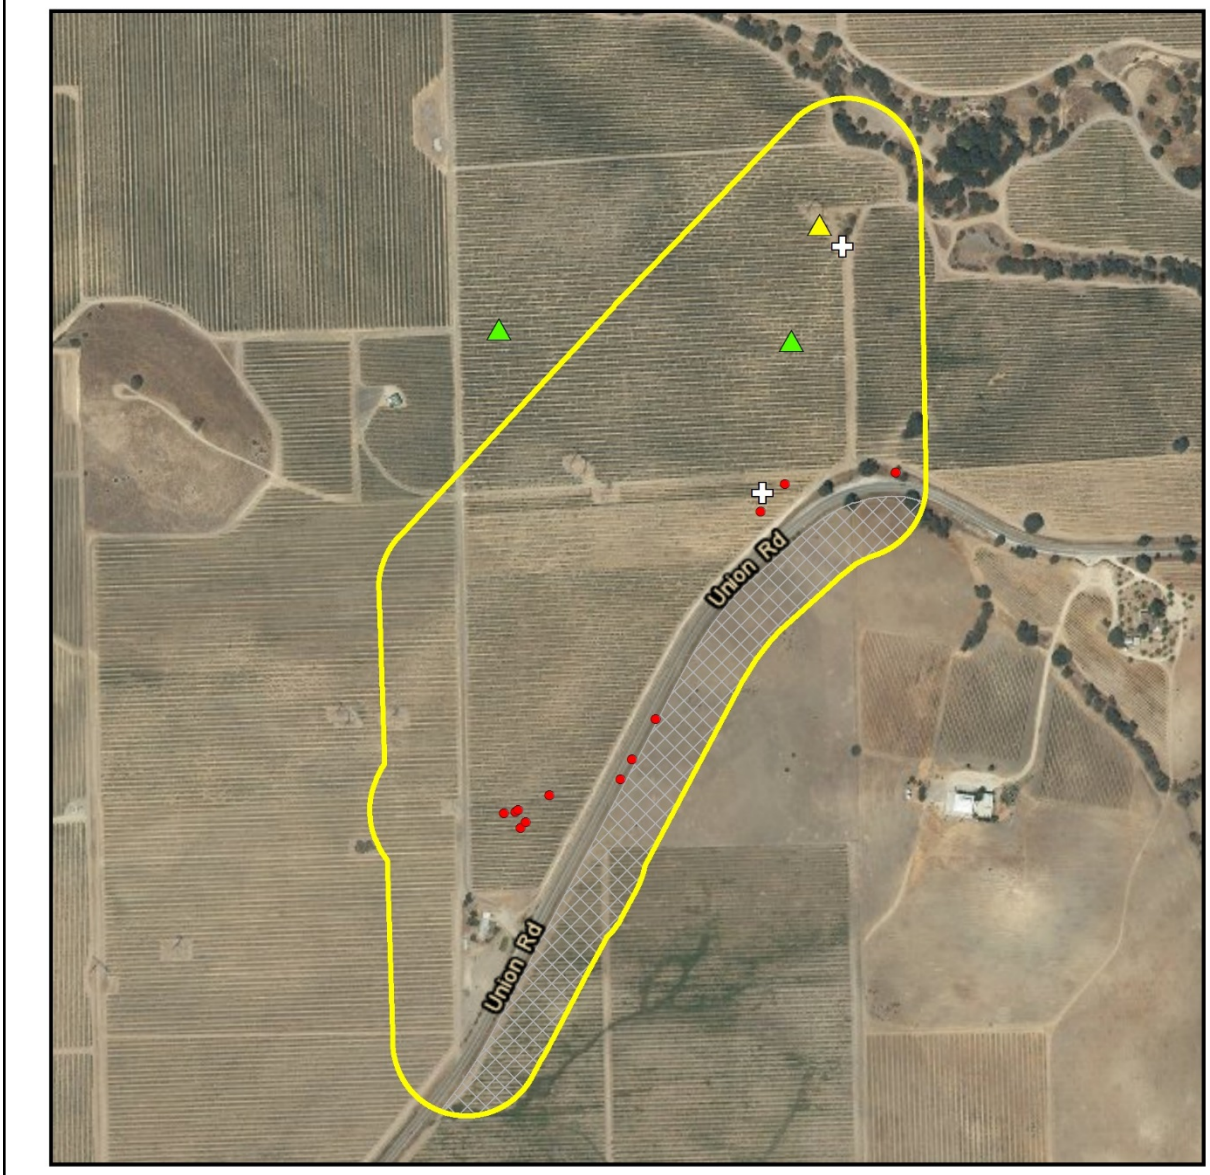
4.4.2.12 MONTEREY DUSKY-FOOTED WOODRAT

No Monterey dusky-footed woodrat (*Neotoma macrotis luciana*) CNDDB occurrences have been recorded within 5 miles of the project. Biologists observed one woodrat midden outside of the BSA in March 2016, approximately 0.5 mile north of the project along Dry Creek. The riparian area in which the midden was observed is contiguous with the riparian corridor in the northeast corner of the BSA. Therefore, this species is likely to occur within the BSA. However, due to the lack of suitable habitat within the substation footprint, it is unlikely that this species would be found within the substation footprint.

4.4.2.13 AMERICAN BADGER

No American badger (*Taxidea taxus*) CNDDB occurrences have been recorded within 5 miles of the project. No American badger or evidence of this species was observed during field surveys. Nonnative grasslands and blue oak woodlands observed in the BSA may provide suitable habitat for this species. In addition, an abundance of prey species is present within and around the BSA, such as California ground squirrels (*Otospermophilus beecheyi*) and other small rodent species. Because of the presence of suitable habitat and the abundance of documented occurrences, American badgers are likely to occur in the BSA.

Figure 8. CNDDB Records of Sensitive Animals in the Project Vicinity



4.4.2.14 SAN JOAQUIN KIT FOX

Fifteen San Joaquin kit fox (*Vulpes macrotis mutica*) CNDDB occurrences were recorded in the nine-quadrangle search between 1971 and 2012, most of which have been recorded at Camp Roberts more than 12 miles to the northwest. One kit fox is known to have moved from Camp Roberts, approximately 12 miles northwest of the project, to the Carrizo Plain, located 40 miles southeast of the project (California State University, Stanislaus 2016). The last recorded San Joaquin kit fox occurrence at Camp Roberts was in 2004. Natural connections between the Salinas River and Pajaro River watersheds, the Carrizo Plain Natural Area, and the San Joaquin Valley provide migration corridors for San Joaquin kit fox; however, the amount of movement between these areas is unknown. There are no known significant barriers to dispersal or migration between the documented populations of San Joaquin kit fox in the Shandon Valley and Camp Roberts. The Dry Creek riparian corridor in the northeast corner of the BSA may serve as a migration corridor for San Joaquin kit fox traveling to/from natural open space areas to the northeast and southwest (South Coast Wildlands 2008). There are three historical records (1990 through 1991) for San Joaquin kit fox within 5 miles of the project substation site, with the nearest occurrence located approximately 2.5 miles to the west. The project substation site is entirely dominated by vineyards and surrounded by vineyards to the north, east, and west. Orchards and vineyards, similar to those observed in the BSA, have been reported to provide marginal habitat for this species due to their open structure and their underlying layer of herbaceous vegetation to support a prey base (Clark 2001; Warrick et al. 2007).

To further assess the potential for San Joaquin kit fox to occur in the BSA, biologists conducted a focused survey in June 2016. The County's Kit Fox Habitat Evaluation Form was completed to assess the quality of habitat at and around Estrella Substation. Field surveys were then conducted by walking transects approximately 10 feet apart, identifying suitable prey base, and mapping dens that could be considered suitable for San Joaquin kit fox based on morphological characteristics. Burrows were considered potential dens if they had entrances that were 4 inches or larger. A portion of the BSA south of Union Road was not accessible due to landowner restrictions; therefore, this area was not mapped or surveyed in detail. This grassland area, however, likely provides suitable habitat for San Joaquin kit fox with a prey base (i.e., California ground squirrel, small mammals, ground-nesting birds, and insects) and the potential to provide natal or nonnatal den sites (White, P.J. and K.Ralls 1993). No San Joaquin kit fox were observed during the surveys and no signs of San Joaquin kit fox were observed (tracks, scat, etc.) within the accessible survey areas. Approximately 100 small mammal dens were observed within the BSA during the walking surveys, which appeared to be inhabited by California ground squirrel and pocket gopher (*Thomomys bottae*). The abundance of these species throughout the BSA provides a suitable prey base for San Joaquin kit fox within the BSA. Two dead California ground squirrels were observed during the surveys; however, they appeared to have been predated by raptors due to their proximity to large perches (such as transmission towers) and the intact nature of skin on the carcasses. Although no sign of San Joaquin kit fox was observed, 12 4-inch burrows were identified and mapped during the surveys that could be considered potential dens based on their morphology (Figure 9).

Due to the presence of burrows of sufficient size (i.e., suitable as potential dens) within the BSA, and the abundant prey base available within the BSA, there is potential for San Joaquin kit fox to occur. However, due to a lack of recent known occurrences in the immediate vicinity of the project, and the presence of human and vehicular traffic associated with the vineyard that dominates the BSA, it is unlikely that San Joaquin kit fox would use the BSA for extended periods of time.

Figure 9. Map of San Joaquin Kit Fox Survey Results

4.4.3 Nesting Migratory Passerine Birds and Raptors

Nesting habitat for migratory passerine birds and raptors protected by the MBTA and California Fish and Game Code Section 3500 et seq. is present throughout the BSA, including trees, shrubs, and freshwater emergent wetland vegetation. In addition, several owl boxes were observed throughout the agricultural areas in the BSA. There is high potential for avian species to nest in the BSA during the typical nesting season (February 1–August 31). Nesting is unlikely outside of the typical nesting season, although some avian species may forage year-round near the work zone.

5 DISCUSSION

Based on an in-depth literature review and field surveys, 10 special-status plant species and 23 additional special-status wildlife species were determined to be either likely to occur, have potential to occur, or unlikely to occur. There is also high potential for avian species to nest in the BSA during the typical nesting season (February 1–August 31).

Dry Creek, an ephemeral drainage channel, was observed in the northeast corner of the BSA. This feature may be subject to USACE, CDFW, and/or RWQCB jurisdiction. This feature may also serve as a wildlife migration corridor for dispersal of species between local areas and at larger scales between regions.

EXECUTIVE SUMMARY

A Biological Resources Technical Report (BRTR) has been prepared for the 70 kilovolt (kV) power line component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by Pacific Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC. PG&E proposes to construct and operate approximately 7 miles of new overhead 70 kV double-circuit power line between Estrella Substation and an existing 70 kV power line, and reconductor approximately 3 miles of the existing 70 kV power line from the point of connection to the existing Paso Robles Substation in the city of Paso Robles. PG&E will undertake this portion of the project

This BRTR was prepared to document the existing biological resources in the vicinity of the power line. Biological resources considered for this report include sensitive species of plants and animals, sensitive habitats and natural communities, and water features potentially subject to state or federal jurisdiction. A literature review of existing information and field surveys were conducted to document biological resources at the project encompassed within a Biological Study Area (BSA). This report outlines the methodologies that were used to assess biological resources and documents existing biological resources in the vicinity of the power line portions of the project.

Two special-status animals—loggerhead shrike (*Lanius ludovicianus*; California Department of Fish and Wildlife [CDFW] species of special concern) and bald eagle (*Haliaeetus leucocephalus*; state endangered and CDFW fully protected) were observed in the BSA. In addition, 19 special-status plant species and 25 additional special-status wildlife species were determined to be either likely to occur, have potential to occur, or unlikely to occur. There is also high potential for avian species to nest in the BSA during the typical nesting season (February 1–August 31). The BSA is located in federally designated vernal pool fairy shrimp (*Branchinecta lynchi*) critical habitat and suitable habitat for this species was observed within the BSA. Several potentially jurisdictional wetlands and waters, including Salinas River, Huerhuero Creek, several unnamed natural drainages, and wetland features, were observed throughout the BSA. These features may also serve as wildlife migration corridors for dispersal of species between local areas and at larger scales between regions.

1 INTRODUCTION

Pacific Gas and Electric Company (PG&E) proposes to construct a new approximately 7-mile double-circuit 70 kilovolt (kV) power line and reconductor approximately 3 miles of existing power line in the Paso Robles area of San Luis Obispo County, California (Figure 1). PG&E is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by PG&E and NextEra Energy Transmission West, LLC. This Biological Resources Technical Report (BRTR) has been prepared to document the existing biological resources in the vicinity of the power line portions of the project. A similar report has been prepared for the substation component of the project, referred to as Estrella Substation, and the results of that effort are presented under separate cover.

Biological resources considered include sensitive and common plants and animals, habitats and sensitive natural communities, wildlife movement corridors, and water features potentially subject to state or federal jurisdiction. This report describes the methodologies used to assess the biological resources known to occur and with the potential to occur at the project, and documents existing biological resources in the vicinity of the power line portions of the project.

A Biological Study Area (BSA) was established to include the maximum anticipated extent of project-related effects. The BSA included an additional 400-foot buffer around the new 70 kV power line segment, and an additional 100-foot buffer around the reconductoring segment (Figure 2). The BSA was slightly expanded in some areas to account for variability in the project alignment. Field surveys focused on areas within the BSA, as described in Section 3.3, Field Surveys, below.

1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The power line consists of a new, approximately 7-mile-long 70 kV power line between Estrella Substation and an existing 70 kV power line (new power line segment) and the reconductoring of approximately 3 miles of the existing line from the point of connection to Paso Robles Substation (reconductoring segment).

1.2 Project Component

The 70 kV power line will use a combination of tubular steel poles (TSPs) and light-duty steel poles (LDSPs). A common neutral will be collocated along the entire length from Estrella Substation to Paso Robles Substation. A fiber optic line for communication services will be installed on the 70 kV power line to provide a fiber optic link between Estrella Substation and Paso Robles Substation. In locations where existing distribution lines are located in close proximity to the power line alignment, the distribution conductors may be collocated on the power line structures.

2 REGULATORY BACKGROUND

2.1 Federal

2.1.1 Endangered Species Act

The federal Endangered Species Act (ESA) of 1973 (United States Code [U.S.C.] Title 16, Sections 1531–1544)*, as amended,* protects plants, fish, and wildlife that are listed as endangered or threatened by the U.S. Fish and Wildlife Service (USFWS) or the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries). Section 9 of the ESA prohibits the "take" of listed fish and wildlife, where "take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (Code of Federal Regulations [CFR] Title 50, Section 17.3). For plants, this statute prohibits removing, possessing, maliciously damaging, or destroying any listed plant *under federal jurisdiction* and removing, cutting, digging-up, damaging, or destroying any listed plant in knowing violation of state law (16 U.S.C. 1538).

The ESA allows for issuance of incidental take permits to private parties either in conjunction with a Habitat Conservation Plan (HCP) or as part of a Section 7 consultation (which is discussed in the following paragraph). Under Section 10 of the ESA, a private party may obtain incidental take coverage by preparing an HCP to cover target species within the project area, identifying impacts to the covered species, and presenting the measures that will be undertaken to avoid, minimize, and mitigate such impacts.

Under Section 7 of the ESA, federal agencies are required to consult with USFWS and/or NOAA Fisheries, as applicable, if their actions—including permit approvals or funding—may affect a federally listed species (including plants) or designated critical habitat. If the project is likely to adversely affect a species, the federal agency will initiate formal consultation with USFWS and/or NOAA Fisheries and issue a biological opinion as to whether a proposed agency action(s) is likely to jeopardize the continued existence of a listed species (jeopardy) or adversely modify critical habitat (adverse modification). As part of the biological opinion, USFWS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity, provided that the action will not jeopardize the continued existence of the species or adversely modify designated critical habitat.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 (16 U.S.C. 703–711) protects all migratory birds, including active nests and eggs. Birds protected under the MBTA include all native waterfowl, shorebirds, hawks, eagles, owls, doves, and other common birds such as ravens, crows, sparrows, finches, swallows, and others, including their body parts (for example feathers and plumes), active nests, and eggs. A complete list of protected species can be found in 50 CFR 10.13. Enforcement of the provisions of the federal MBTA is the responsibility of USFWS.

2.1.3 Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (BGEPA) of 1940 (16 U.S.C. 668) specifically protects bald and golden eagles and their nests from intentional harm or trade in parts of these species. The 1972 amendments increased penalties for violating provisions of the BGEPA or regulations issued pursuant thereto and strengthened other enforcement measures. Rewards are provided for information leading to arrest and conviction for violation of the BGEPA.

2.1.4 Clean Water Act

2.1.4.1 WATERS AND WETLANDS: CLEAN WATER ACT SECTIONS 401 AND 404

The purpose of the Clean Water Act (CWA) (33 U.S.C. 1251 et seq.) is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Waters of the United States include rivers, streams, estuaries, the territorial seas, ponds, lakes, and wetlands. Wetlands are defined as those areas "that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3).

The U.S. Environmental Protection Agency (USEPA) and U.S. Army Corps of Engineers (USACE) have recently released a new rule that would revise this definition and clarify which bodies of water are covered by the CWA. However, on October 9, 2015, the U.S. Court of Appeals for the 6th Circuit granted a nationwide stay on the rule, and the previous interpretations and guidance remain in effect until further notice.

USACE issues permits for work in wetlands and other waters of the United States based on guidelines established under Section 404 of the CWA. Section 404 of the CWA prohibits the discharge of dredged or fill material into waters of the United States, including wetlands, without a permit from USACE. USEPA also has authority over wetlands and may, under Section 404(c), veto a USACE permit.

Section 401 of the CWA requires all Section 404 permit actions to obtain a state Water Quality Certification or waiver.

2.2 State

2.2.1 California Endangered Species Act

Sections 2050–2098 of the California Fish and Game Code (the California Endangered Species Act [CESA]) prohibit the take of state listed endangered and threatened species unless specifically authorized by the California Department of Fish and Wildlife [CDFW]). The state definition of "take" is to hunt, pursue, catch, capture, or kill a member of a listed species or attempt to do so. CDFW administers the CESA and authorizes take through permits or memorandums of understanding issued under Section 2081 of the CESA, or through a consistency determination issued under section 2080.1. CESA Section 2090 requires state agencies to comply with threatened and endangered species protection and recovery and to promote conservation of these species.

2.2.2 Fully Protected Species Under the California Fish and Game Code

The California Fish and Game Code designates certain fish and wildlife species as "fully protected" under Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish). Fully protected species may not be taken or possessed at any time, and no permits may be issued to PG&E for incidental take of these species. [1]

[1] While take of fully protected species may be authorized by CDFW under a Natural Communities Conservation Plan (NCCP), PG&E activities are not covered by an NCCP so this permitting option is not available.

2.2.3 Protection for Birds: California Fish and Game Code

California Fish and Game Code Section 3503 et seq. state that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders of Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird.

2.2.4 Native Plant Protection Act of 1977

The Native Plant Protection Act of 1977 (NPPA; California Fish and Game Code Sections 1900–1913) includes provisions that prohibit the taking of endangered or rare native plants. CDFW administers the NPPA and generally regards as rare many plant species included on California Rare Plant Rank (CRPR) 1A, 1B, 2A, and 2B of the California Native Plant Society (CNPS) Inventory of Rare and Endangered Vascular Plants of California. In addition, sometimes CRPR 3 and 4 plants are considered if the population has local significance in the area and is impacted by the project.

Section 1913(b) of the California Fish and Game Code includes a specific provision to allow for the incidental removal of endangered or rare plant species, if not otherwise salvaged by CDFW, within a right-of-way to allow a public utility to fulfill its obligation to provide service to the public.

2.2.5 California Species of Special Concern

Species of Special Concern (SSC) is a category conferred by CDFW to fish and wildlife species that meet the state definition of threatened or endangered, but have not been formally listed (e.g., federally or state listed species), or are considered at risk of qualifying for threatened or endangered status in the future based on known threats. SSC is an administrative classification only, but these species should be considered "special-status" for the purposes of the California Environmental Quality Act (CEQA) analysis (see the Significance Criteria section of this document).

2.2.6 Porter-Cologne Water Quality Control Act

The State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCB) have jurisdiction over all surface water and groundwater in California, including wetlands, headwaters, and riparian areas. SWRCB or the applicable RWQCB must issue waste discharge requirements for any activity that discharges waste that could affect the quality of waters of the state.

2.2.7 Lake and Streambed Alteration Agreement Under the California Fish and Game Code

In addition to listed and special-status species, CDFW regulates activities under California Fish and Game Code Sections 1600–1616 that require a streambed alteration agreement permit. California Fish and Game Code Section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following:

- Substantially divert or obstruct the natural flow of any river, stream, or lake.
- Substantially change or use any material from the bed, channel, or bank of any river, stream, or lake.
- Deposit debris, waste, or other materials that could pass into any river, stream, or lake.

2.3 Local

This section includes a summary of local or regional plans, policies, or regulations that identify sensitive or special-status species in the project area, as well as local polices or ordinances that protect biological resources. Because California Public Utilities Commission (CPUC) has exclusive jurisdiction over the siting, design, and construction of the project, the project is not subject to local discretionary regulations related to biological resources. The following summary is provided for informational purposes and to assist with CEQA review.

2.3.1 County of San Luis Obispo General Plan

The County of San Luis Obispo General Plan includes a Conservation and Open Space Element (COSE), which addresses the protection and management of natural resources, as well as goals, policies, and strategies to conserve, protect, and restore biodiversity and open space (County of San Luis Obispo 2010). The COSE includes seven goals and policies within those goals. Specific goals pertaining to biological resources identified in the COSE include:

- **Goal BR 1** Native habitat and biodiversity will be protected, restored, and enhanced;
- **Goal BR 2** Threatened, rare, endangered, and sensitive species will be protected;
- **Goal BR 3** Maintain the acreage of native woodlands, forests, and trees at 2008 levels;
- **Goal BR 4** The natural structure and function of streams and riparian habitat will be protected and restored;
- **Goal BR 5** Wetlands will be preserved, enhanced, and restored;
- **Goal BR 6** The County's fisheries and aquatic habitats will be preserved and improved; and,
- **Goal BR 7** Significant marine resources will be protected.

2.3.2 County of San Luis Obispo Oak Woodlands Management Plan

The Native Tree Committee of the County of San Luis Obispo (County) has established an Oak Woodland Management Plan to encourage the long-term conservation of oak woodlands. The plan is voluntary and for informational purposes only and is not bound by the law. The plan discusses the status, economic values, natural resource values, and aesthetic and open space values of oak woodlands. In addition, the plan offers the following conservation efforts: (1) design around existing oaks; (2) encourage clustered, denser developments; (3) encourage landscaping with oak trees/natives; (4) improve oak regeneration on grazed lands; and (5) purchase conservation easements (County of San Luis Obispo 2003).

2.3.3 County of San Luis Obispo San Joaquin Kit Fox Mitigation Requirements

The County evaluates impacts to San Joaquin kit fox (*Vulpes macrotis mutica*) for County-permitted projects to ensure impacts to kit fox are mitigated to an insignificant level under CEQA. CDFW and the County have developed mitigation measures to reduce impacts to San Joaquin kit fox habitat to an insignificant level. In addition, pre-determined standard mitigation ratios have been developed for County-permitted projects located within kit fox habitat areas (County of San Luis Obispo 2006).

The project is located within a County-designated kit fox habitat area with recommended general measures and practices. The project proponents will take into consideration local policies and land use priorities and concerns as they relate to biological resources; however, the project is exempt from the County's discretionary permitting and mitigation and CPUC is the lead agency under CEQA.

2.3.4 City of El Paso De Robles General Plan

The City of El Paso De Robles (City) General Plan includes a Conservation Element and Open Space Element, which address the City's commitment to rehabilitate and enhance the environmental quality of the planning area through protection, planning, and management of natural resources (Rincon Consultants, Inc. 2003). The General Plan includes the following goal pertaining to biological resources:

- **Goal C-3: Biological Resources.** As feasible, preserve native vegetation and protected wildlife, habitat areas, and vegetation, through avoidance, impact mitigation, and habitat enhancement.

Specific policies identified to help achieve this goal include:

- **Policy C-3A: Oak Trees.** Preserve existing oak trees and oak woodlands. Promote the planting of new oak trees; and

- **Policy C-3B: Sensitive Habitat.** Incorporate habitats into project design, as feasible, including: oak woodlands, native grasslands; wetlands, and riparian areas.

2.3.5 City of El Paso de Robles Oak Tree Preservation Ordinance

The City of El Paso De Robles Oak Tree Ordinance (Ordinance No. 835 N.S.), as amended in 2001 (Municipal Code Amendment 2001-001-Oak Trees), ensures the "preservation of oak trees in order to maintain the heritage and character of the City of El Paso de Robles ("The Pass of the Oaks") as well as preserve the beauty and identity of the community" (City of El Paso de Robles 2002). While not applicable to the project, the Oak Tree Ordinance requires permits to prune and permits to remove oak trees as identified in Section 10.01.030 as well as encourages preservation and maintenance of existing oak trees as identified in Section 10.01.070.

3 METHODOLOGY

A biological resources study was conducted to support this BRTR using a literature review and field surveys to document the potential for biological resources to occur within the project.

3.1 Literature and Records Review

Biologists reviewed available regional and local natural resources information including published and unpublished documents, publicly available data, and plant records. Database searches of the CDFW California Natural Diversity Database (CNDDB) (CDFW 2016a) and the CNPS Inventory of Rare and Endangered Plants (CNPS 2016) included the 12 U.S. Geological Survey (USGS) 7.5-minute quadrangles at and surrounding the project —Bradley, Adelaida, York Mountain, Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel (USGS 2016b). Resources reviewed with respect to site-specific information included, but were not limited to:

- CDFW CNDDB (CDFW 2016a);
- CDFW California Wildlife Habitat Relationship Systems (CDFW 2016d);
- CNPS Rare Plant Program (CNPS 2016);
- eBird: An online database of bird distribution and abundance [web application] (eBird 2016);
- *A Guide to the Amphibians and Reptiles of California* (California Herps 2000–2016);
- Natural Resources Conservation Service (NRCS) Web Soil Survey (U.S. Department of Agriculture [USDA] NRCS 2016b);

- USFWS Critical Habitat Portal (USFWS 2016a);
- National Wetland Inventory (NWI) (USFWS 2016b);
- USFWS Species List (USFWS 2016c);
- USGS National Hydrography Dataset (USGS 2016a);
- USGS 7.5-minute series topographic quadrangle maps (USGS 2016b);
- Aerial imagery of the project;
- Biological Report for an Outdoor Recreational Resort (Assessor's Parcel Numbers 025-431-037, -038, &-039) (Althouse and Meade, Inc. 2007)
- Dry-Season Sampling for Federally-Listed Large Branchiopods at the Paso 160 Project (Helm Biological Consulting 2008); and,
- 90-Day Report for the Paso Robles Motorcoach Park Site (Hacker 2008).

Biological resources data were collected and overlaid on to geospatial maps from desktop and field sources to develop a Geographic Information Systems (GIS) database specific to the project. The database provides relevant sensitive species location data, habitat types (including vegetation cover), potential jurisdictional water features (including ditches and drainages), and critical habitat for federally listed species. The data were compiled using ArcGIS software.

3.2 Sensitive Biological Resources

Sensitive plants and animals are defined within this report to include species, subspecies, varieties, and populations recognized by USFWS and CDFW that are classified into the following categories:

- Species, subspecies, and populations listed or proposed for listing as threatened or endangered pursuant to the ESA, and species that are candidates for such listings.
- Species and subspecies listed or proposed for listing by the state of California as threatened or endangered pursuant to the CESA.
- Animals listed on the California Special Animals List as SSC and Fully Protected (CDFW 2016c).
- Plants included in the Special Vascular Plants, Bryophytes, and Lichens List (CDFW 2016c) with a threatened, endangered, SSC, or CRPR rank of 1 or 2.
- Plants assigned California Rare Plant Ranks 1and 2.

Additionally, riparian habitats and water bodies likely under the jurisdiction of USACE, CDFW, and/or RWQCB were considered.

Throughout this report, species, subspecies, varieties, and populations of species are broadly referred to as "species," a term that is used in this BRTR to indicate the pertinent taxonomic levels that are recognized by the state and federal governments with jurisdiction over plants and animals.

Records of sensitive plants, animals, and natural communities within the Bradley, Adelaida, York Mountain, Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, and San Miguel USGS 7.5-minute quadrangles were queried from the CNDDB RareFind5 (CDFW 2016a) and CNPS Online Inventory of Rare and Endangered Plants (CNPS 2016) databases. Using the information generated from literature reviews and field surveys, the list of special-status species with the potential to occur was further refined to reflect the species that may occur within the BSA. The likelihood of special-status species occurrence was determined based on natural history parameters, including, but not

limited to, the species' range, habitat, foraging needs, migration routes, and reproductive requirements. For the purpose of this study, potential for occurrence determinations were made using the following general categories:

- *Present* – Reconnaissance-level, focused, or protocol-level surveys documented the occurrence or observation of a species in the BSA.

- *Seasonally present* – Individuals were observed in the BSA only during certain times of the year.

- *Likely to occur* – The species has a strong likelihood to be found in the BSA prior to or during construction but has not been directly observed to date during project surveys. The likelihood that a species may occur is based on the following considerations: suitable habitat that meets the life history requirements of the species is present in the BSA; migration routes or corridors are within the BSA; records of sighting are documented within or near (5 miles) the BSA; and there is an absence of invasive predators (e.g., bullfrogs). The main assumption is that records of occurrence have been documented within or near (5 miles) the BSA, the BSA falls within the range of the species, suitable habitat is present, but it is undetermined whether the habitat is currently occupied.

- *Potential to occur* – There is a possibility that the species can be found in the BSA prior to or during construction, but has not been directly observed to date. The likelihood that a species may occur is based on the following conditions: suitable habitat that meets the life history requirements of the species is present within the BSA; migration routes or corridors are within the BSA; and there is an absence of invasive predators (e.g., bullfrogs). The main assumption is that the BSA falls within the range of the species, suitable habitat is present, but no records of sighting are located within or near (5 miles) the BSA, or the records are old and unreliable and it is undetermined whether the habitat is currently occupied.

- *Unlikely to occur* – The species is not likely to occur in the BSA based on the following considerations: lack of suitable habitat and features that are required to satisfy the life history requirements of the species (e.g., absence of foraging habitat; lack of reproductive areas, and lack of sheltering areas); presence of barriers to migration/dispersal; presence of predators or invasive species that inhibit survival or occupation (e.g., the presence of bullfrogs or invasive fishes); or lack of hibernacula, hibernation areas, or estivation areas on site.

- *Absent* – Suitable habitat does not exist in the BSA, the species is restricted to or known to be present only within a specific area outside of the BSA, or focused or protocol-level surveys did not detect the species.

3.3 Field Surveys

Biologists conducted general biological reconnaissance surveys between April 20–22 and April 27–30, 2016. Follow-up reconnaissance surveys were conducted November 14–15, 2017. The reconnaissance-level surveys included documentation of plants and animals, vegetation types, and identification of waters, wetlands, and riparian areas that were potentially under the jurisdiction of USACE, CDFW, and/or RWQCB. Vegetation communities were classified using Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Habitat was evaluated for potential to support those special-status species identified during the desktop review, and detailed notes and photographs were taken to support determinations of the potential for those species to occur within the BSA (Appendices A, B, and C). The BSA was examined for presence or signs of occupation by special-status species (e.g., footprints, scat, feathers, or burrows) and auditory information (for example specific vocalizations of birds). Binoculars were also used to facilitate identification of species. Trees and other structures (such as buildings and bridges) within the BSA were scanned for avian nests and roosting locations. A handheld Trimble

GeoXT Global Positioning System (GPS) unit capable of sub-meter accuracy was used to record locations of any sensitive resources and other potential constraints to the project. A compiled list of all plant species observed during the surveys is included as Appendix A, and a compiled list of all wildlife species observed during the surveys is included as Appendix B.

Two rounds of botanical surveys were conducted in 2016. The first surveys were conducted between April 20–22 and 27–30, 2016; the second round between June 6–8, 2016. Botanical surveys were conducted over a range of bloom periods to capture the flowering period of all special-status plants that were determined to have a likelihood for occurrence in the BSA. CDFW's Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities (CDFW 2009) was generally followed to facilitate a consistent and systematic approach to the survey and assessment of special-status native plants and natural communities so that reliable information was produced and the potential of locating a special-status plant species or natural community was maximized. Surveys were conducted by walking transects throughout the BSA where suitable habitat was present to ensure thorough coverage. Every plant taxon that was observed in the BSA was identified to the taxonomic level necessary to determine rarity and listing status (Appendix A). The surveyors referred to The Jepson Manual (Baldwin et al. 2012) to verify plant identification. The surveyors mapped all special-status occurrences with a handheld Trimble GeoXT GPS unit capable of sub-meter accuracy.

Potential jurisdictional wetlands and waters of the State and United States were mapped at the desktop level using data available from the NWI (USFWS 2016b), USGS National Hydrography Dataset (USGS 2016a), USGS topographic maps, and aerial photographs. Refer to Appendix D for watershed boundaries and water feature data mapped on the NWI (USFWS 2016b) Wetland mapping field efforts were conducted in all areas suspected of having jurisdictional wetlands or waters. Delineation of potentially jurisdictional areas within the BSA was based on on-site investigations conducted by biologists on April 20–22 and April 27–29, 2016. Delineators utilized A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (USACE 2008), The Jepson Manual (Baldwin et al 2012), and the 2016 National Wetland Plant List (Arid West Region) (USACE 2016). Presence of hydrophytic vegetation, hydrological conditions, hydric soil indicators, ordinary high water marks (OHWMs), and/or defined bed and banks were evaluated. Areas identified in the field as potentially jurisdictional waters are shown in Appendix E. The project has been designed to avoid all potentially jurisdictional waters. Refer to Section 4.3.1, Jurisdictional Waters, below for additional detail regarding jurisdictional waters within the BSA.

Biologists conducted a California red-legged frog site assessment on November 14 and 15, 2016, to determine locality records and potential California red-legged frog habitat within 1 mile of the project. The biologists generally followed USFWS's *Revised Guidance on Site Assessments and Field Surveys for the California Red-legged Frog* (USFWS 2005a). Biologists queried the CNDDB for all reported localities within a 1-mile radius of the project, reviewed existing literature and biological reports, and reviewed aerial imagery within a 1-mile radius of the project to assess suitable upland and aquatic habitat areas. Biologists then conducted field surveys to map and characterize all accessible aquatic habitats within 1 mile of the project. Aquatic habitats were characterized based on the type of water feature (e.g., pond versus stream, pool versus riffle, ephemeral versus permanent), vegetation, water depth, bank characteristics and depth, substrate, and presence of aquatic predators (e.g., bullfrogs or centrarchid fishes). USFWS habitat site assessment data sheets were filled out for each aquatic habitat area that was surveyed and photographs were taken to document the habitat conditions. Access was prohibited at several aquatic features within 1 mile of the project, including man-made ponds on three golf courses (Hunter Ranch Golf Course, Paso Robles Golf Club, and River Oaks Golf Course) and one freshwater pond west of Golden Hill Road. Where possible, these areas were scanned from a distance using high-powered binoculars, assessed using aerial imagery, and existing literature was reviewed. Aquatic features included in the California red-legged frog site assessment are shown in Figure 6. Site assessment data sheets are included in Appendix F.

3.4 Nomenclature Conventions

Vegetation alliance nomenclature in this report follows Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Taxonomic conventions follow The Jepson Manual: Higher Plants of California (Baldwin et al. 2012) for plants, the American Ornithologists' Union (AOU) Checklist of North and Middle American Birds (AOU 2015) for birds, a Complete List of Amphibian, Reptile, Bird and Mammal Species in California (CDFW 2014) for other vertebrate wildlife, and the CDFW Special Animals List (CDFW 2016c) for invertebrates.

4 EXISTING CONDITIONS

The project is located within and around Paso Robles in San Luis Obispo County. Topography within the BSA ranges from flat (0%) to gently sloping rolling hills (0–20%) to steep slopes (>45%) along roadside cuts. Elevation in the BSA ranges between approximately 650 and 1,000 feet above mean sea level.

San Luis Obispo County has a Mediterranean climate, which includes warm to hot, dry summers and mild to cool, wet winters. The coastal climate within San Luis Obispo County is generally mild with average temperatures ranging from 45 to 70 degrees Fahrenheit (°F). Inland temperatures are much more variable with average temperatures ranging from 35 to 93°F. Precipitation in the region also varies spatially and temporally with increasing precipitation typically occurring near the coast. Average annual rainfall in the vicinity of the project is 15.2 inches with approximately 90% of the rain falling between October and April. Average monthly rainfall in the summer months is significantly lower than the winter months only averaging about 0.2 inches per month between May and September. The above temperature and precipitation data is based on Monthly Climate Normals data published by the National Oceanic and Atmospheric Administration (NOAA) from the Paso Robles, California climate station (COOP:046730), located approximately 0.3 miles west of the project for the period between 1981 and 2000 (NOAA 2016a).

4.1 Soils

Soil type descriptions were queried using Official Soil Series Descriptions (OSDs). Site-specific soil data was queried using the USDA Web Soil Survey database (NRCS 2016b). Hydric ratings were determined using the Hydric Soils of the United States List (NRCS 2015). Soil types in the project include the following (Figure 3):

- Arbuckle fine sandy loam, 0 to 2 percent slopes
- Arbuckle fine sandy loam, 2 to 9 percent slopes
- Arbuckle-Positas complex, 9 to 15 percent slopes
- Arbuckle-Positas complex, 15 to 30 percent slopes
- Arbuckle-Positas complex, 30 to 50 percent slopes
- Arbuckle-Positas complex, 50 to 75 percent slopes
- Arbuckle-San Ysidro complex, 2 to 9 percent slopes (hydric)
- Ayar and Diablo soils, 9 to 15 percent slopes
- Balcom-Calleguas complex, 50 to 75 percent slopes
- Hanford and Greenfield gravelly sandy loams, 0 to 2 percent slopes
- Hanford and Greenfield gravelly sandy loams, 2 to 9 percent slopes
- Linne-Calodo complex, 9 to 30 percent slopes
- Linne-Calodo complex, 30 to 50 percent slopes
- Metz loamy sand, 0 to 5 percent slopes (hydric)

- Metz-Tujunga complex, occasionally flooded, 0 to 5 percent slopes (hydric)
- Mocho clay loam, 0 to 2 percent slopes, Major Land Resource Area (MLRA) 14 (hydric)
- Nacimiento-Ayar complex, 9 to 30 percent slopes
- Nacimiento-Los Osos complex, 9 to 30 percent slopes
- Nacimiento-Los Osos complex, 30 to 50 percent slopes
- San Ysidro loam, 0 to 2 percent slopes, MLRA 14 (hydric)
- Sesame sandy loam, 9 to 30 percent slopes
- Xerofluvents-Riverwash association (hydric)

Arbuckle soils are very deep, well-drained soils that are formed in alluvial materials from mainly conglomerate and metasedimentary rocks. Arbuckle soils occur on low terraces at elevations of 27 to 610 meters and have slopes of 0 to 75 percent. They typically occur in dry subhumid mesothermal climates with hot dry summers and cool moist winters. Vegetation communities on these soils are mainly annual grasses and forbs either alone or as an understory of blue oak trees (*Quercus douglasii*). Many areas with Arbuckle soils are used for dryland and irrigated orchards, irrigated row and field crops, dry farmed grain and for rangeland grazing (NRCS 2016a).

Positas soils consist of deep and very deep, moderately well-drained soils that formed in alluvial material from mixed rock sources. These soils typically occur on stream terraces at elevations of 200 to 1,600 feet and have slopes of 2 to 75 percent. These soils occur in dry subhumid, mesothermal climates with hot, dry summers and cool, moist winters. Vegetation communities on these soils are typically annual grasses, forbs, and scattered oaks. Many areas with Positas soils are primarily used for rangeland grazing, but some are also used for dryland grain crops and vineyards (NRCS 2016a).

San Ysidro soils consist of deep, moderately well-drained soils that are formed in alluvium from sedimentary rocks. These soils occur on old, low terraces in elevations of less than 1,500 feet and have slopes of 0 to 9 percent. These soils occur in dry subhumid, mesothermal climates with hot, dry summers and cool, moist winters. Vegetation communities associated with these soils are typically annual grasses and forbs. These soils are typically used for growing dryland grains, dryland pasture, and shallow rooted row crops (NRCS 2016a).

Nacimiento soils consist of moderately deep, well-drained soils that formed in material weathered from calcareous shale and sandstone. These soils occur on rolling uplands in elevations of 50 to 4,800 feet and have mostly complex slopes of 9 to 75 percent. These soils typically occur in dry subhumid mesothermal climates with warm, dry summers and cool, moist winters. Vegetation communities associated with this soil type are annual grasses and forbs with coast live oaks (*Quercus agrifolia*) and other trees in some places. These soil types are often used for rangeland grazing and dry farmed grain (NRCS 2016a).

Los Osos soils consist of moderately deep, well-drained soils that formed in material weathered from sandstone and shale. These soils occur on uplands at elevations of 100 to 3,500 feet and have slopes of 5 to 75 percent. These soils typically occur in dry subhumid mesothermal climates with warm, dry summers and cool, moist winters. Vegetation communities associated with this soil type are mostly annual grasses and forbs with some perennial grasses, coastal sagebrush, and live oaks. These soil types are typically used for rangeland grazing, but some are used for grain crops and sudan grass pasture (NRCS 2016a).

Diablo soils are typically well-drained soils that formed from weathered shale, sandstone, and consolidated sediments with minor areas of tuffaceous material. This soil type typically occurs on rolling to steep uplands in elevations of 25 to 3,000 feet and slopes 5 to 50 percent. Vegetation communities typically occurring on this soil type are annual grasses and forbs. This soil type is most commonly used for grazing and for production of dry farmed grain, mainly barley (NRCS 2016a).

Ayar soils are deep or very deep, well-drained soils that are formed from weathered, decomposed alkaline shale and sandstone material. This soil type is often associated with rolling hills with slopes of 5 to 75 percent at elevations of 150 to 3,500 feet. Natural vegetation communities associated with this soil type are annual grasses and forbs with scattered blue oak, live oak, and white oaks (*Quercus alba*). This soil type is often used for dry farmed grain, almond and apricot orchards, and livestock grazing (NRCS 2016a).

Balcom soils are moderately deep and well-drained soils that are formed from soft, calcareous shale and sandstone substrates. These soils typically occur on hills that have slopes of 5 to 75 percent at elevations of 200 to 2,300 feet. This soil type is associated with dry subhumid mesothermal climates with warm, dry summers and cool, moist winters. The natural vegetation associated with these soils is dominated by annual grasses and mustards. This soil type is commonly used for open rangeland and grasslands and is often associated with watersheds (NRCS 2016a).

Calleguas soils are typically shallow, well-drained soils that occur on exposed and eroded upland slopes and hills and are primarily formed from weathered sedimentary rock. This soil type occurs on slopes of 9 to 75 percent at elevations of 100 to 2,800 feet. The natural vegetation communities associated with this soil type are typically annual grasses and forbs with some scattered coastal sagebrush species. This soil type is commonly used for grazing and is often associated with watersheds (NRCS 2016a).

Hanford soils are typically very deep, well-drained soils that form from moderately coarse alluvium dominated by weathered granitic material. These soils are found on stream bottoms, floodplains and in alluvial fans. They typically occur on slopes of 0 to 15 percent at elevations of 150 to 3,500 feet. This soil type is associated with dry subhumid mesothermal climates with hot, dry summers and cool, moist winters. Native vegetation occurring on this soil type is typically annual grasses and herbs. Hanford soils are used for a wide range of agricultural cultivations including various fruit and vegetable crops (NRCS 2016a).

Greenfield soils are deep, well-drained soils that are formed from alluvium materials derived from granitic and other mixed rock sources. These soils occur within alluvial fans and terraces on slopes of 0 to 30 percent at elevations of 100 to 3,500 feet. Greenfield soils occur in dry, subhumid mesothermal climates with hot, dry summers and cool, moist winters. This soil types is often associated with annual grasses, forbs, some shrubs, and scattered oak trees. Irrigated fields, forage and fruit crops, and dryland grain crops are often associated with this soil type (NRCS 2016a).

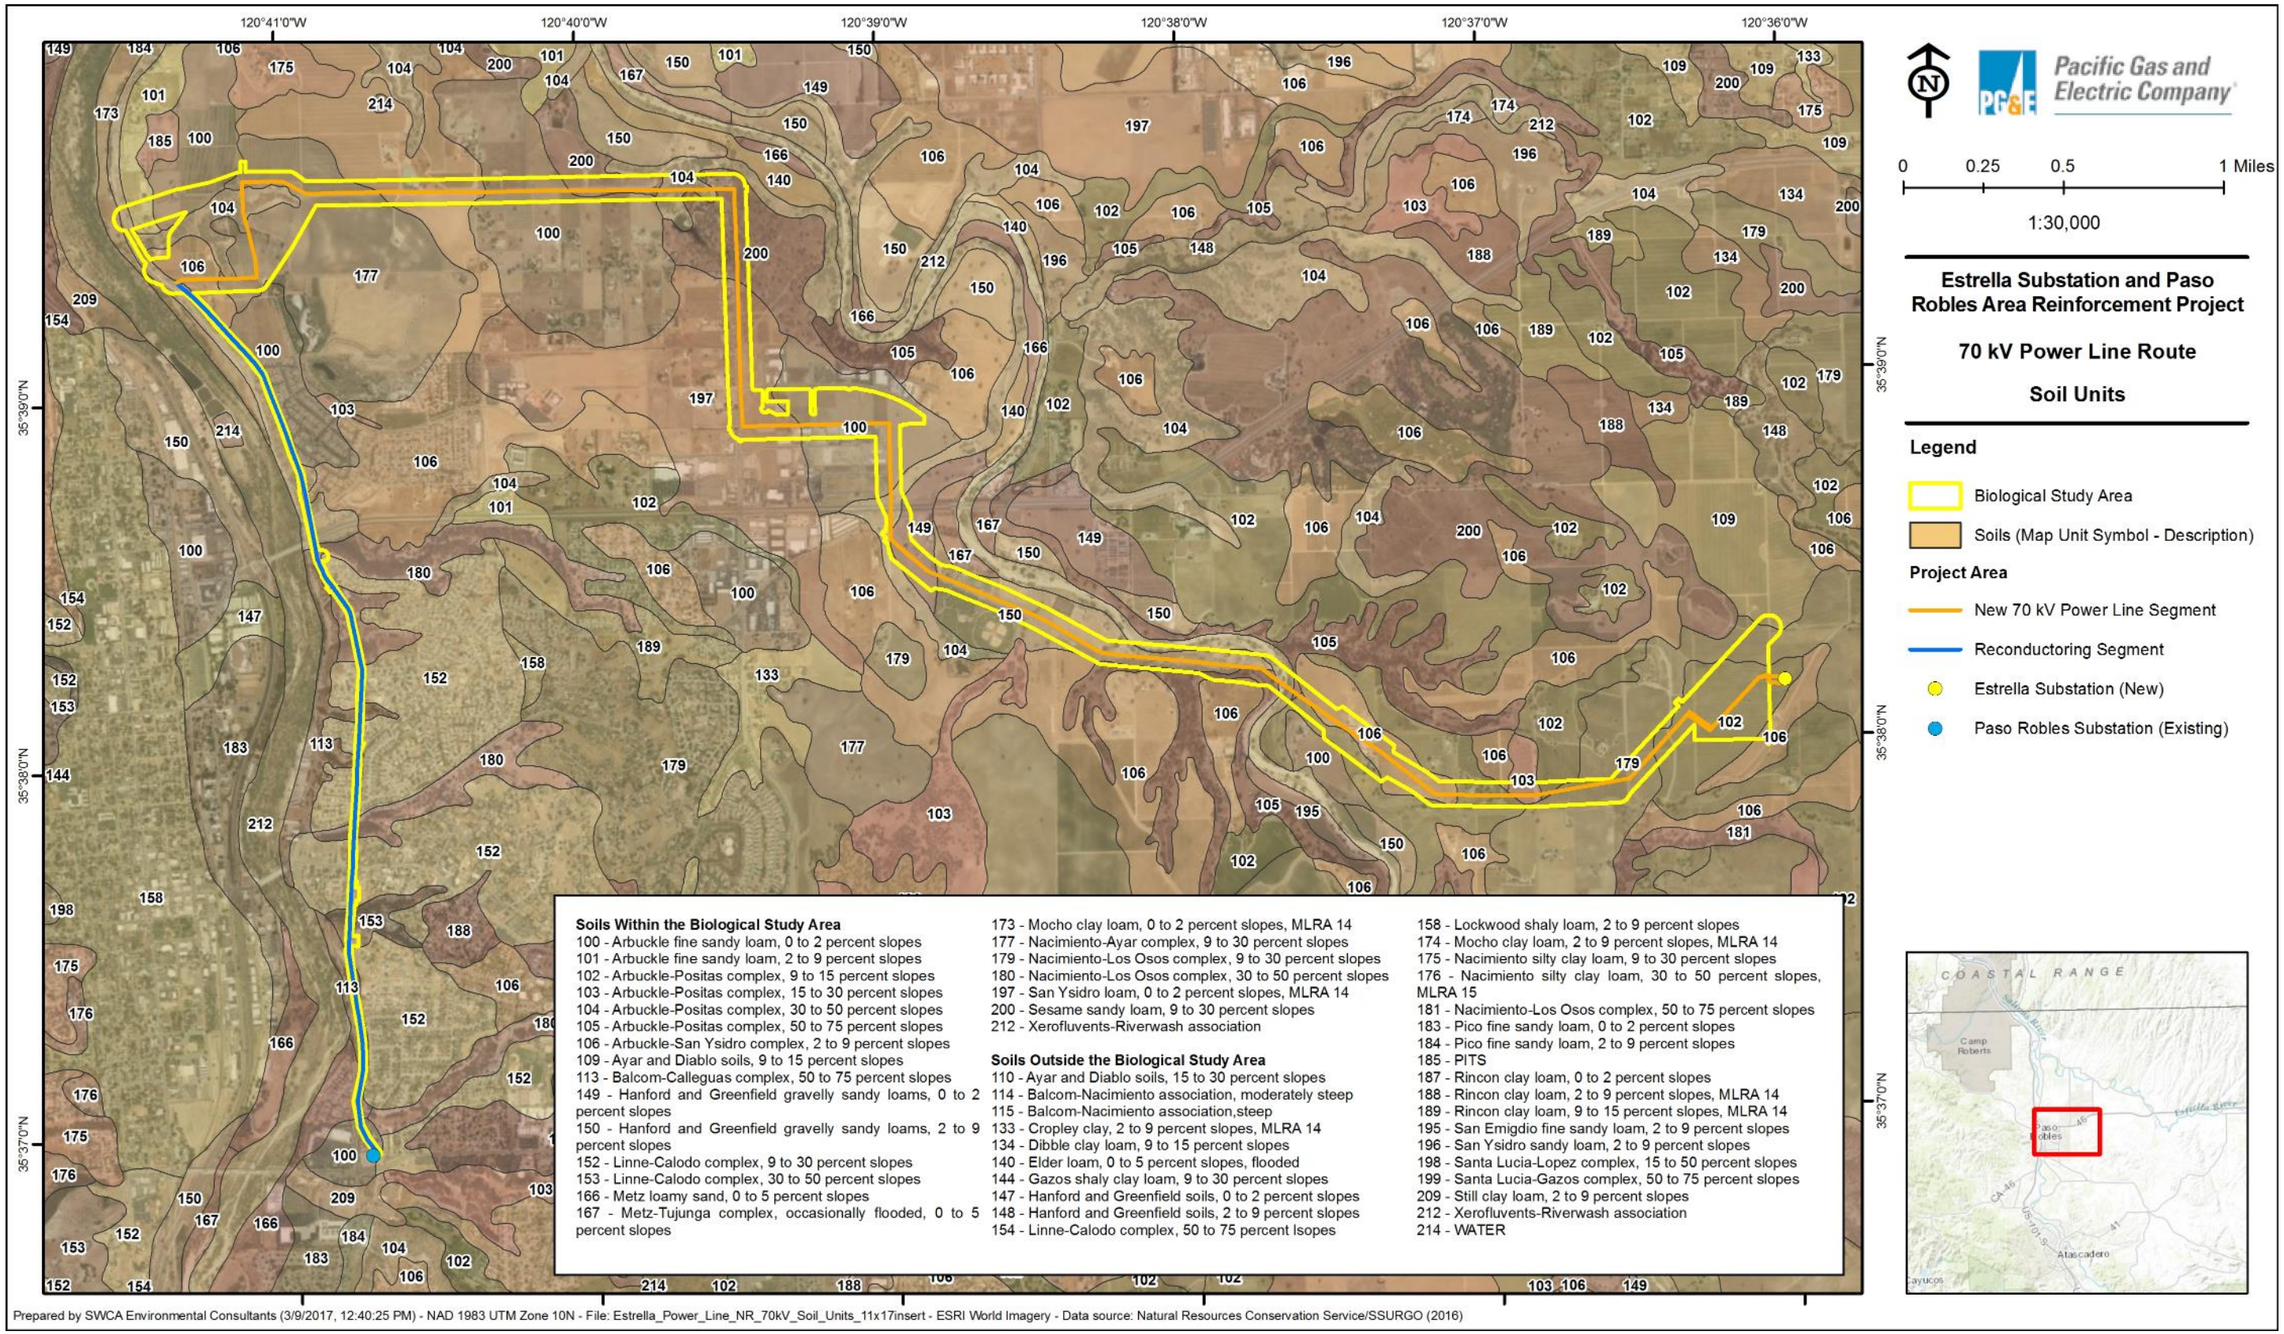
Linne soils are moderately deep, well-drained soils that consist largely of weathered soft shale and sandstone materials. These soils typically occur on mountainous uplands and foothills that have slopes of 5 to 75 percent. Linne soils are found at elevations of 100 to 2,200 feet. Vegetation communities associated with this soil type are typically native annual grasses and forbs, live oak woodlands and coastal sage scrub. These soils are often farmed for grain crops and almond orchards (NRCS 2016a).

Calodo soils are shallow, well-drained soils that consist of calcareous shale and sandstone material. These soils occur in uplands on slope gradients of 15 to 75 percent and at elevations from 500 to 2,500 feet. Vegetation associated with this soil type is primarily live oak woodlands, a mixture of toyon and manzanita, and an understory of annual grasses. This soil type is often cultivated as dryland grain crops (NRCS 2016a).

Metz soils are very deep, excessively drained soils that consist of alluvial material derived primarily from sedimentary rock and some other mixed rock material. This soil type typically occurs in floodplains and alluvial fans with slopes of 0 to 15 percent and at elevations of 25 to 2,500 feet. Vegetation communities associated with this soil type generally consist of willows, annual grasses, and forbs. Cultivation on this soil type is typically irrigated pasture, hay, truck crops, field crops, and fruit crops (NRCS 2016a).

Tujunga soils are very deep, excessively drained soils that consist of alluvial material derived primarily from weathered granitic rock. This soil type occurs in alluvial fans and floodplains with slopes of 0 to 9

percent. Typically, these soils occur at elevations between 6 to 1,970 feet. Vegetation communities associated with these soils are typically dominated by shrubs, annual grasses, and forbs. This soil type is often found in urban areas and when cultivated is often planted with citrus, grapes, and fruits crops. It is also used for grazing livestock (NRCS 2016a).



Mocho soils are typically deep, well-drained soils that consist largely of alluvium materials derived from sandstone and shale rock. This soil type is found in alluvial fans that have slopes of 0 to 9 percent at elevations between 20 to 3,500 feet. Vegetation communities associated with this soil type are typically annual grasses and forbs. This soil type is often intensively used for grain crops, forage, field, and some fruit crops (NRCS 2016a).

Sesame soils consist of moderately deep, well-drained soils formed from weathered granitic, quartz diorite, gabbrodiorite and metamorphic rocks. This soil type is often found in foothills and mountainous uplands with slopes of 0 to 75 percent. This soil type occurs in subhumid mesothermal climates with warm, dry summers and cool, moist winters. Vegetation communities associated with sesame soils are primarily annual grasses and forbs with scattered blue oak, live oak, and shrubs. This soil type is primarily used for grazing, as well as growing small grains (NRCS 2016a).

Xerofluvents are somewhat excessively drained soils that occur in floodplains at 0 to 2 percent slopes and are often comprised of sand, stratified gravel, sandy loam, and gravelly loam materials. These soils occur at an elevation of 600 to 1,500 feet and are not considered prime farmland (NRCS 2016b).

Riverwash are soils that occur in river channels at slopes of 0 to 2 percent and are comprised entirely of sandy material. These soils occur at an elevation of 600 to 1,500 feet and are not considered prime farmland (NRCS 2016b).

4.2 Habitats and Natural Communities

4.2.1 Critical Habitat

The BSA is located within federally designated critical habitat Unit 29C for vernal pool fairy shrimp (USFWS 2006b, 2016a) (Figure 4). Federally designated vernal pool fairy shrimp critical habitat Unit 29C, Central Coast Ranges, is located in San Luis Obispo County, northeast of Paso Robles. Vernal pool fairy shrimp are known to currently occupy this region. Unit 29C contains the following habitat constituents that are required to support this species: mound and inter-mound topography within a matrix of surrounding upland habitat, which provide for cyst dispersal and adequate pool hydroperiods, and vernal pool wetland features within a matrix of upland habitat, which provide for food, shelter, hatching, growth, and reproduction (USFWS 2006b).

The eastern portion of the new 70 kV power line segment, between Estrella Substation and SR-46, is located within critical habitat Unit 29C (Figure 4). No habitat constituents required for the growth and survival of vernal pool fairy shrimp were observed in the portion of the BSA that is located within designated critical habitat; however, other portions of the BSA contain preliminarily-mapped seasonal wetlands with adjacent upland habitat. Additional detail regarding vernal pool fairy shrimp and associated habitat is provided in Section 4.4.2, Special-Status Animals, below.

In addition, federally designated critical habitat for steelhead (*Oncorhynchus mykiss*; federally threatened) occurs along Salinas River approximately 200 feet west of the project (Figure 4). The project is located within the Evolutionary Significant Unit for South-Central California Coast steelhead in Salinas Hydrologic Unit 3309, Paso Robles Hydrologic Sub-area 330981 (NOAA 2005). Primary constituent elements for steelhead critical habitat include: (1) freshwater spawning sites; (2) freshwater rearing sites; (3) freshwater migration corridors; and (4) estuarine areas (NOAA 2005). No steelhead critical habitat or primary constituent elements required to support this species occur in the BSA (Figure 4).

4.2.2 Vegetation Communities

The landscape within and surrounding the BSA is composed of a mosaic composition of blue oak woodlands, nonnative grasslands, agricultural, central (Lucian) coastal scrub, Central Coast cottonwood-willow riparian forest, coastal and valley freshwater marsh, sandy wash, ruderal/disturbed, and urban areas. Urban and agricultural landscape consisting of vineyards, orchards, and cultivated crops comprise a large portion of the BSA, as well as areas proposed for future development. Of the vegetation communities present, three (blue oak woodland, Central Coast cottonwood-willow riparian forest, and coastal and valley freshwater marsh) are considered sensitive communities under the City of El Paso De Robles General Plan (Rincon Consultants, Inc. 2003). Similarly, five vegetation communities observed in the BSA (blue oak woodlands, central coastal scrub, sandy wash, Central Coast cottonwood-willow riparian forest, and coastal and valley freshwater marsh) are considered sensitive by CDFW. Appendix E illustrates the vegetation communities traversed by the project.

4.2.2.1 BLUE OAK WOODLAND

Blue oak woodlands are typically dominated by blue oak trees, yet often include other oak species as well as gray pine (*Pinus sabiana*). Blue oak woodlands range from open savannas to dense woodlands, and often contain an understory of grasses and herbs. This habitat type usually contains well-drained soils and occurs below 4,000 feet (Holland 1986).

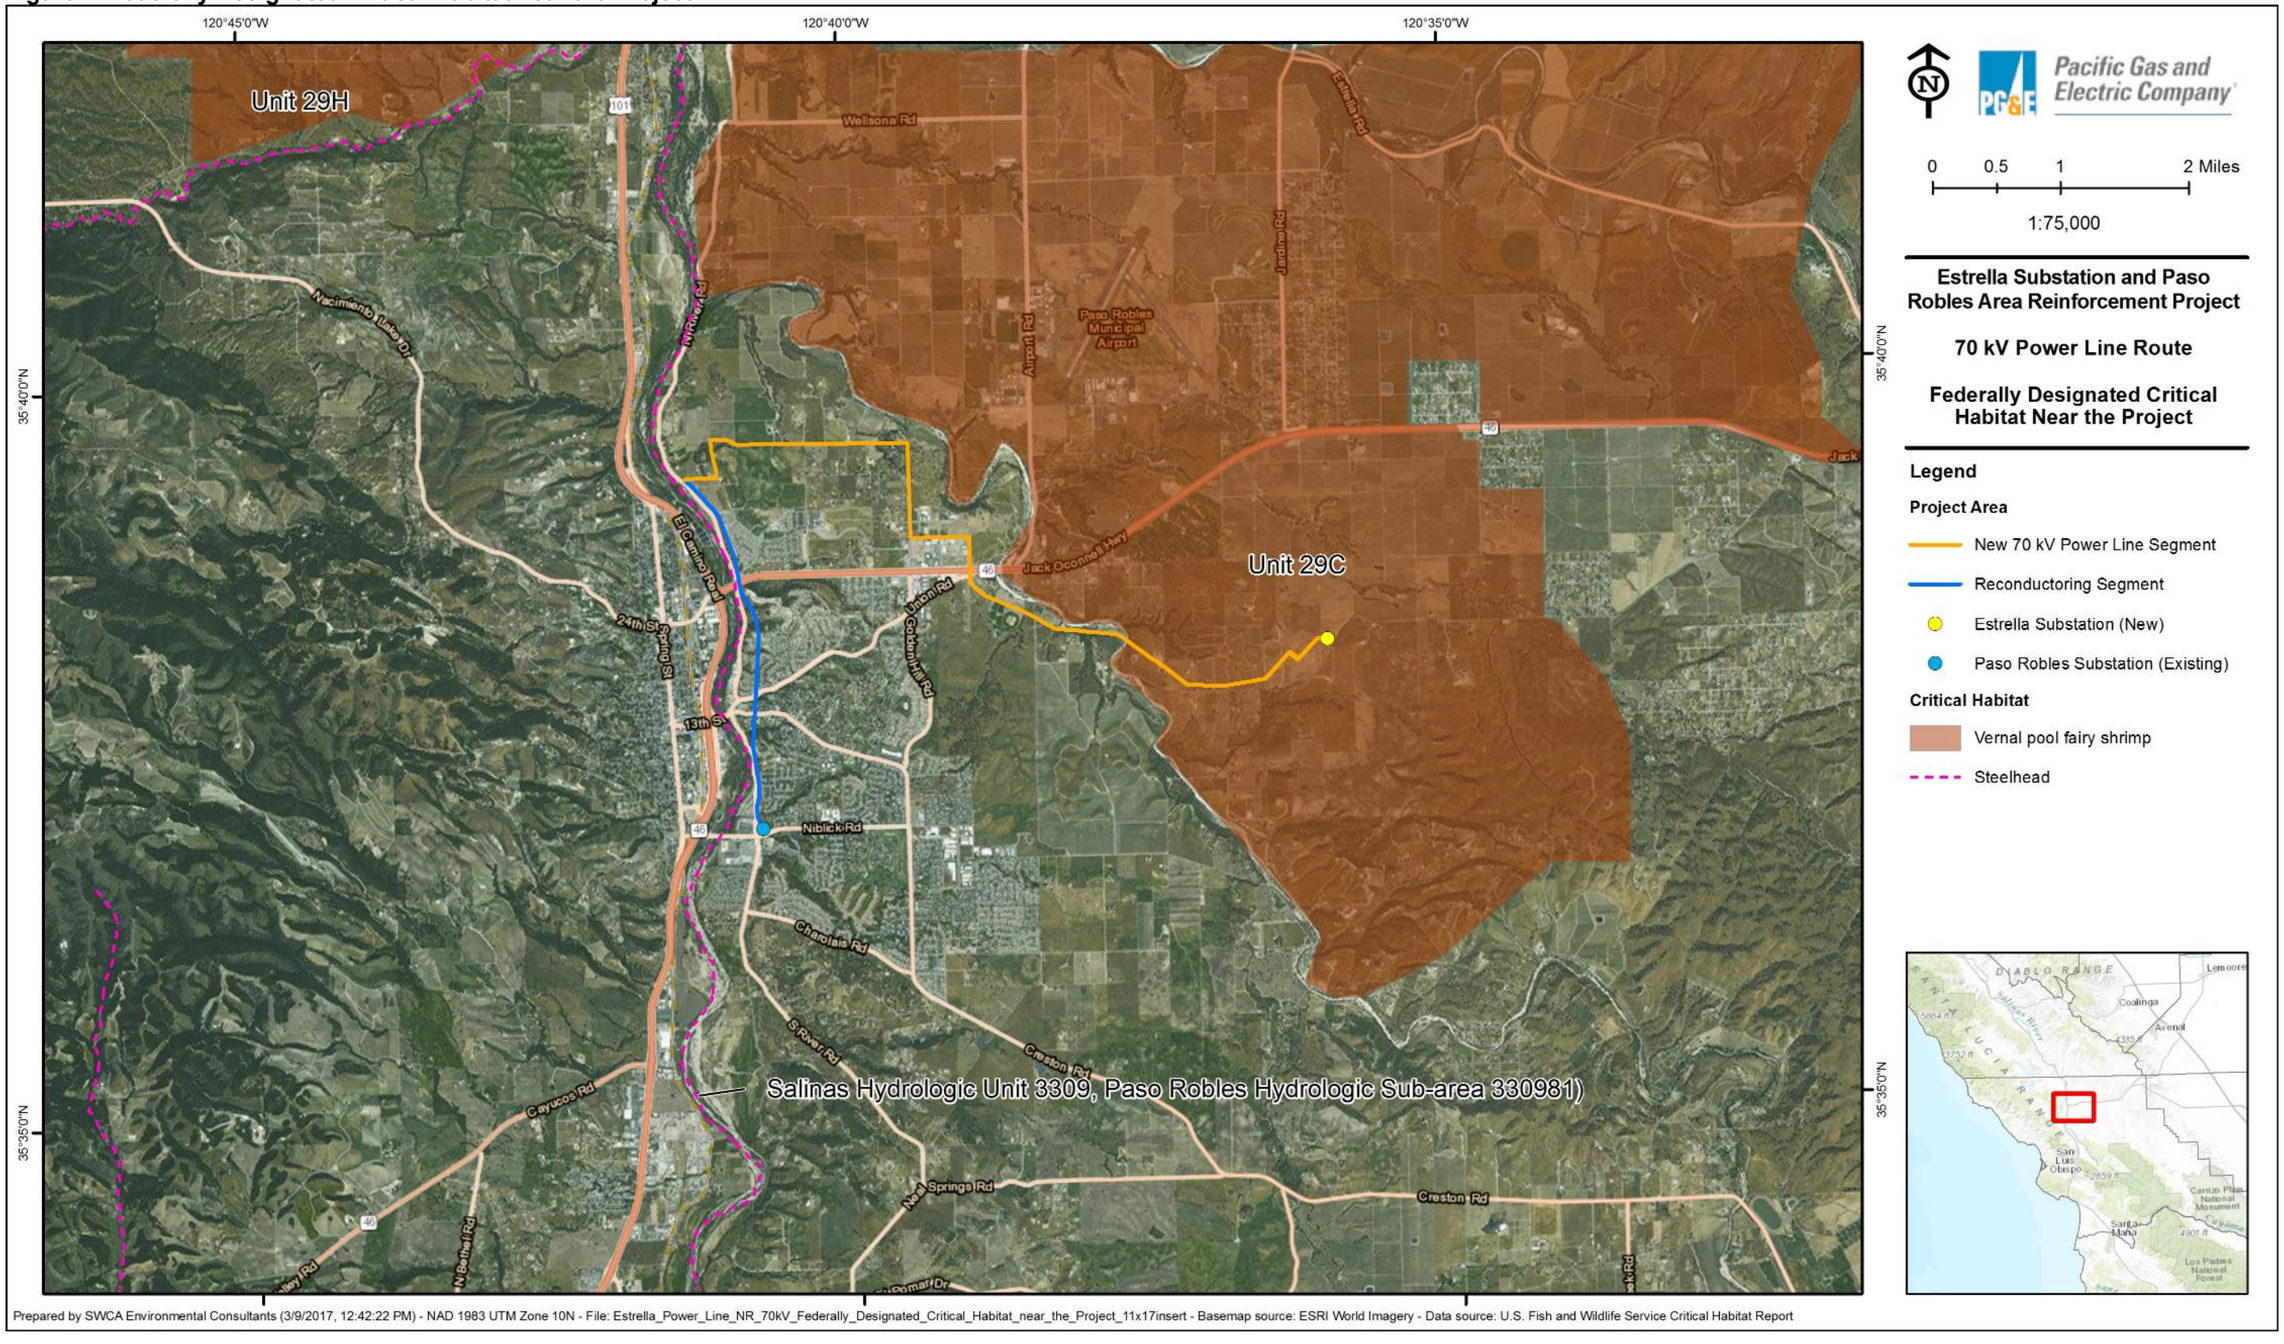
Approximately 67 acres of blue oak woodland were observed throughout the BSA, and it was the dominant vegetation community along drainage channels (Appendix E). Blue oak woodlands in the BSA frequently contained a relatively open canopy and an understory of nonnative grasses and forbs, with more dense

stands occurring along riparian areas. Interspersed stands of valley oak trees (*Quercus lobata*) were observed throughout the blue oak woodlands in the BSA. Approximately 1,600 oak trees greater than 6 inches in diameter at breast height were observed in the BSA.

4.2.2.2 NONNATIVE GRASSLAND

Nonnative grasslands consist of dense to sparse cover of annual grasses generally less than 1 meter high and are dominated by nonnative grasses and forbs, including soft chess (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), slender wild oats (*Avena barbata*), cheatgrass (*Bromus tectorum*), red brome (*Bromus madritensis*), red-stemmed filaree (*Erodium cicutarium*), and short-pod mustard (*Hirschfeldia incana*). Native species may include western ragweed (*Ambrosia psilostachya*), lupines (*Lupinus* spp.), and doveweed (*Croton setigerus*) (Holland 1986).

Approximately 122 acres of nonnative grassland habitat were observed throughout the BSA, frequently overlapping with blue oak woodlands and rural developments. Grasslands in the BSA were primarily dominated by nonnative annual grasses with interspersed patches of native species such as purple needle-grass (*Stipa pulchra*) and nodding needle-grass (*S. cernua*). Several areas of nonnative grasslands throughout the BSA are subject to frequent mowing or grading.



4.2.2.3 AGRICULTURAL

Agricultural habitat is identified by active cultivation and planting of crops in an area. The main form of agriculture in the BSA is grape vineyards. Agricultural areas typically provide low habitat value for sensitive plants and wildlife species. Approximately 171 acres of agricultural lands were observed in the BSA.

4.2.2.4 CENTRAL (LUCIAN) COASTAL SCRUB

Central (Lucian) coastal scrub is dominated by shrubs generally growing 3 to 6 feet tall in dense stands. This community typically occurs on exposed, often south facing slopes with shallow, rocky soils in San Luis Obispo and Santa Barbara Counties (Holland 1986). Central coastal scrub in the BSA was observed in two small (1.3 acres total) patches: adjacent to Huerhuero Creek and Salinas River. Plants observed in this community include a dense stand of coyote brush (*Baccharis pilularis*) interspersed with species typically associated with ruderal areas, including nonnative annual grasses, wild radish (*Raphanus sativa*), and field mustard (*Brassica rapa*). Both patches occur along the roadside edge in close proximity to the riparian corridors.

Figure 4. Federally Designated Critical Habitat near the Project

This page intentionally left blank.

4.2.2.5 CENTRAL COAST COTTONWOOD-WILLOW RIPARIAN FOREST

Central Coast cottonwood-willow riparian forest consists of riparian forest typically dominated by Fremont's cottonwood (*Populus fremontii*), sycamore (*Platanus racemosa*), and interspersed coast live oak with an understory of willows (*Salix* spp.), coyote brush, and stinging nettle (*Urtica dioica*). This vegetation community generally occurs along creeks and floodplains of sub-perennial streams with a fairly coarse substrate and a seasonally variable water table (Holland 1986).

Central Coast cottonwood-willow riparian forest is limited to a small patch (0.04 acre) along the northwest corner of the BSA along Salinas River, approximately 200 feet west of the project. This vegetation community extends along much of Salinas River; however, it is generally located outside of the BSA.

4.2.2.6 COASTAL AND VALLEY FRESHWATER MARSH

Coastal and valley freshwater marsh is generally dominated by perennial, emergent monocots such as cattail (*Typha* sp.) and bulrush (*Scirpus* sp.) growing in closed canopies. These areas are subject to permanent freshwater flooding or prolonged saturation, which leads to an accumulation of deep, peaty soils. This vegetation community typically occurs along the upper portion of the Sacramento-San Joaquin River Delta as well as along the coast and in coastal valleys near river mouths, lakes, and springs (Holland 1986).

A small area (0.05 acre) of coastal and valley freshwater marsh was observed in the BSA where the reconductoring segment crosses over an unnamed tributary to Salinas River. This feature was dominated by cattail (*Typha latifolia*) and contained standing water during the April 2016 field survey.

4.2.2.7 SANDY WASH

Sandy washes are comprised of sand and gravel accumulation found in riverbeds and floodplains (Anderson et al. 1976). Approximately 4.5 acres of sandy wash were observed in the BSA along a dry ephemeral creek channel known as Huerhuero Creek. This area contained little to no vegetation between the OHWMs with a higher density of grasses and forbs in the floodplain. Intermittent cottonwood, willow, and other woody shrubs were scattered throughout the sandy wash.

4.2.2.8 RUDERAL

Ruderal habitat areas are often defined as occurring along road edges and other highly disturbed areas. Typically, species dominating ruderal habitat areas are able to quickly colonize disturbed areas due to their high rates of seed dispersal and fast growth. Ruderal areas are typically dominated by nonnative vegetation, but some native species can also occur.

Approximately 28 acres of ruderal habitat occur within the BSA, generally along roadsides, within rural and urban developments, and adjacent to agricultural areas. Species observed in ruderal areas in the BSA included but were not limited to nonnative annual grasses, poison hemlock (*Conium maculatum*), radish (*Raphanus* spp.), mustard (*Brassica* spp.), and various thistles.

4.2.2.9 URBAN/DEVELOPED

Urban/developed habitat is found in regularly and highly disturbed areas, including areas that have been developed and/or include landscaping such as trees, shrubs, ornamental plants, and lawns. Vegetation density, canopy cover, and species composition will vary based on the structure and composition of the developed area. Vegetation may include native or exotic species, or a combination of both.

Approximately 96 acres of urban/developed lands occur in the BSA along and within rural and urban developments and recreational areas. Vegetation in these areas includes manicured lawns and ornamental trees and shrubs.

4.3 Drainages and Water Features

The project is located within the Huerhuero Creek and Paso Robles Creek-Salinas River watersheds. These watersheds are located in the north-central portion of San Luis Obispo County. The new 70 kV power line segment is primarily located within the Huerhuero Creek watershed. The headwaters of Huerhuero Creek occur in the Coast Ranges just south of the city of Creston. Huerhuero Creek generally flows northwest where it bisects and briefly parallels the project approximately 1.5 miles west of Estrella Substation and just south of SR-46. Huerhuero Creek then continues northwest for another 7 miles before draining into Salinas River in Paso Robles, approximately 1 mile north of the project.

The reconductoring segment is located within the Paso Robles Creek-Salinas River watershed. Within this watershed, the central drainage feature is Salinas River. The river flows north-northwest through the Salinas Valley, bisecting the Coast Ranges, before draining into the Pacific Ocean nearly 100 miles northwest of the project. The reconductoring segment parallels the eastern perimeter of the Salinas River riparian corridor.

The project crosses several other unnamed drainages that eventually flow into Huerhuero Creek and/or Salinas River. Refer to Appendix D for watershed boundaries and water feature data mapped on the NWI (USFWS 2016b) and USGS National Hydrography Dataset (USGS 2016a). Refer to Appendix E for potentially jurisdictional waters of the State and United States that were mapped during the April 2016 field surveys. A more in-depth discussion of potentially jurisdictional waters within the BSA is provided below.

4.3.1 Jurisdictional Waters

In the BSA, Salinas River, Huerhuero Creek, several unnamed natural drainages, and wetland features were identified during reconnaissance-level field assessments (Appendix E). A formal jurisdictional delineation report has not been prepared at this time for this project.

4.3.1.1 USACE JURISDICTIONAL WETLANDS AND OTHER WATERS

Salinas River, Huerhuero Creek, and 12 other unnamed ephemeral drainages may be subject to USACE jurisdiction (Appendix E). These features contained an OHWM and a connection to downstream waters of the United States. In addition, nine wetland features were preliminarily mapped during the April 2016 field surveys, including: a) one freshwater emergent wetland along Union Road, b) four seasonal wetlands with a vernal pool indicator species along Golden Hill Road, c) two seasonal wetlands with vernal pool indicator species approximately 200 feet east of Buena Vista Drive, d) one seasonal wetland approximately 1,200 feet northeast of the interconnection point, and e) one freshwater marsh along North River Road near the interconnection point (Appendix E). During a subsequent site visit on November 14, 2016, four of the preliminarily mapped seasonal wetlands/vernal pools along Golden Hill Road had been directly eliminated due to a Recreational Vehicle (RV) park development. The wetland features were graded over and filled with a 4-foot high earthen berm at the time of the November 2016 site visit. Based on the presence of hydrophytic vegetation, wetland hydrology, hydric soils, and/or a nexus to waters of the United States, the remaining five wetland features may be subject to USACE jurisdiction. Other drainage and wetland features observed in the BSA either: a) did not exhibit an OHWM, b) did not have an apparent connection to downstream waters of the United States, or c) did not meet the definition of a USACE jurisdictional wetland, and are therefore are not generally considered jurisdictional by the USACE.

4.3.1.2 CDFW JURISDICTIONAL WATERS

Similar to Salinas River, Huerhuero Creek, and 12 other unnamed ephemeral drainages that may be subject to the jurisdiction of USACE, these drainages may also be subject to CDFW jurisdiction (Appendix E). These features contained defined bed and banks.

4.4 Sensitive Species

All species identified during the literature review were evaluated for their potential to occur within the BSA. Biologists examined these records and made determinations during reconnaissance-level surveys. All plants and wildlife encountered during reconnaissance-level surveys were recorded. A complete list of species observed is located in Appendices A and B.

4.4.1 Special-Status Plants

Biologists and botanists queried the CNDDB and CNPS databases to review recent accounts of special-status plants within the 12 USGS 7.5-minute topographic quadrangles at and surrounding the project. Local expert botanist, Dr. Dave Keil, also provided expertise regarding special-status species that were historically recorded in the region (D. Keil, personal communication, June 3, 2016). Based on the preliminary review, biologists and botanists compiled a list of special-status plants, as defined by CDFW's Protocols for Surveying and Evaluating Impacts to Special-status Native Plant Populations and Natural Communities (2009), which were likely to occur in the BSA based on site-specific conditions (e.g., soils, geology, topography, elevation, and associated plant communities). The field surveys were floristic in nature, identifying each plant to the taxonomic level. Surveys were conducted in April and June 2016 following a season of good rainfall (approximately 88% of the average) (City of El Paso de Robles 2016), providing optimal conditions for the detection of rare plants. The surveys were conducted over a range of bloom periods to capture the flowering period of all special-status plants with a likelihood for occurrence in the BSA.

No federal, state, or CRPR 1 or 2 listed special-status plant species were observed in the BSA. Elegant buckwheat (*Eriogonum elegans*; CRPR 4.3), was observed in April and June 2016 within the BSA in: (1) the sandy wash along Huerhuero Creek, and (2) along the reconductoring segment approximately 550 feet south of the point of interconnect. The first occurrence was observed along Huerhuero Creek where approximately 300+ individuals were observed along the sandy wash. The second occurrence was observed along the reconductoring segment on the southern bank of the driveway to 800 Clubhouse Drive, approximately 550 feet south of the point of interconnect. Approximately 25 individuals were observed at this location (Appendix E). No additional CNDDB records for this species were returned in the records search.

CRPR 4 listed species do not require evaluation for impact significance during preparation of environmental documents relating to CEQA. Furthermore, this species is not considered to be locally significant; therefore, this species is not address further in this report. A complete list of plants identified during the surveys is located in Appendix A, Flora Compendium.

A total of 53 special-status plants and one natural community of concern (valley oak woodland) were identified during the records search. Two of the 53 special-status plants are federally listed species (Santa Lucia purple amole [*Chlorogalum purpureum* var. *purpureum*] and spreading navarretia [*Navarretia fossalis*]); however, their known range occurs outside of the BSA or had outdated records with no known occurrences in the region (D. Keil, personal communication, June 3, 2016). These species were therefore determined to be unlikely to occur in the BSA. No other federally or state listed species were returned in the records search.

Due to site-specific conditions, it was determined that 15 plants have potential to occur (Table 1), and 4 plants are unlikely to occur within the BSA. The remaining 34 plants and 1 natural community were determined to be absent from the BSA either because suitable habitat does not exist in the BSA, the species is restricted to or known to be present only within a specific area outside of the BSA, or focused or protocol-level surveys did not detect the species or community. Species that were determined to be unlikely to occur (Santa Lucia purple amole, spreading navarretia, Indian Valley spineflower [*Aristocapsa insignis*], and

Santa Cruz microseris [*Stebbinsoseris decipiens*]) or absent from the BSA are not discussed further in this report. Species that were determined to have potential to occur within the BSA are discussed below. Special-status plant species occurrences recorded in the CNDDB (CDFW 2016a) are depicted in Figure 5.

Table 1. Sensitive Plant Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal / State / CRPR[2]	Habitat Associations[3]	Likelihood to Occur in the BSA
round-leaved filaree* *California macrophylla*	--/--/CRPR 1B.2	Annual herb that occurs in open sites, scrub, vertic clay, and occasionally serpentine soils in valley grasslands and foothill woodlands. Blooming period: March–July. Elevation: <1,200 meters.	**Potential to occur.** Grassland and blue oak woodlands may provide habitat for this species. One CNDDB occurrence was recorded 3.15 miles from the project in 1937. Species not observed in the BSA during surveys conducted in the appropriate season.
La Panza mariposa lily *Calochortus simulans*	--/--/CRPR 1B.3	Perennial bulbiferous herb that occurs in meadow habitats found in chaparral, valley grassland, and foothill woodland communities. Associated with sandy (often granitic) soils. Blooming period: April–July. Elevation: 380–1,150 meters.	**Potential to occur.** Grassland and blue oak woodlands may provide habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
dwarf calycadenia* *Calycadenia villosa*	--/--/CRPR 1B.1	Annual herb that occurs in chaparral, valley grassland, and foothill woodlands. Associated with dry, rocky hills, ridges. Blooming period: May –October. Elevation: 240–1,350 meters.	**Potential to occur.** Nonnative grassland and blue oak woodlands may provide habitat for this species. One CNDDB occurrence was recorded 4.7 miles northwest of the project in 2001. Species not observed in the BSA during surveys conducted in the appropriate season.
Hardham's evening-primrose *Camissoniopsis hardhamiae*	-- /--/CRPR 1B.2	Annual herb that is typically found in sandy soil, limestone, and disturbed oak woodland. Blooming period: March–May. Elevation: 140–945 meters.	**Potential to occur.** Sandy soils and blue oak woodlands may provide suitable habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.

Table 1. Sensitive Plant Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal / State / CRPR[2]	Habitat Associations[3]	Likelihood to Occur in the BSA
San Luis Obispo owl's-clover* *Castilleja densiflora* var. *obispoensis*	--/--/ CRPR 1B.2	Annual herb that occurs in coastal grassland. Blooming period: March–June. Elevation: 10–430 meters.	**Potential to occur.** Nonnative grasslands and blue oak woodlands may provide suitable habitat for this species. One CNDDB occurrence was recorded 0.77 miles east of the project in 2005. Species not observed in the BSA during surveys conducted in the appropriate season.
Lemmon's jewelflower* *Caulanthus lemmonii*	--/--/CRPR 1B.2	Annual herb that occurs in grassland, chaparral, and scrub habitat. Blooming period: February–May. Elevation: 80–1,580 meters.	**Potential to occur.** Nonnative grassland and central coastal scrub may provide suitable habitat for this species. Three CNDDB occurrences have been recorded within 5 miles of the project; however, these occurrences were recorded between 1935 and 1960. Species not observed in the BSA during surveys conducted in the appropriate season.
straight-awned spineflower *Chorizanthe rectispina*	--/--/CRPR 1B.3	Annual herb that occurs in chaparral, cismontane woodlands, and coastal scrub. Associated with sandy or gravelly soils. Blooming period is April–July. Elevation: 85–1,035 meters.	**Potential to occur** Sandy soils along Huerhuero Creek and other unnamed drainages may provide suitable habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
Hall's tarplant *Deinandra halliana*	--/--/CRPR 1B.1	Annual herb that occurs in grasslands, open slopes, sink edges, vertic clay, rarely serpentine. Blooming period is April–May. Elevation 260–1,000 meters.	**Potential to occur.** Nonnative grasslands may provide habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
yellow-flowered eriastrum *Eriastrum luteum*	--/--/CRPR 1B.2	Annual herb that occurs in broadleafed upland forest, chaparral, and foothill woodland on drying slopes. Associated with sandy or gravelly soils. Blooming period: May–June. Elevation: <1,000 meters.	**Potential to occur** Blue oak woodlands and sandy soils along Huerhuero Creek may provide suitable habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.

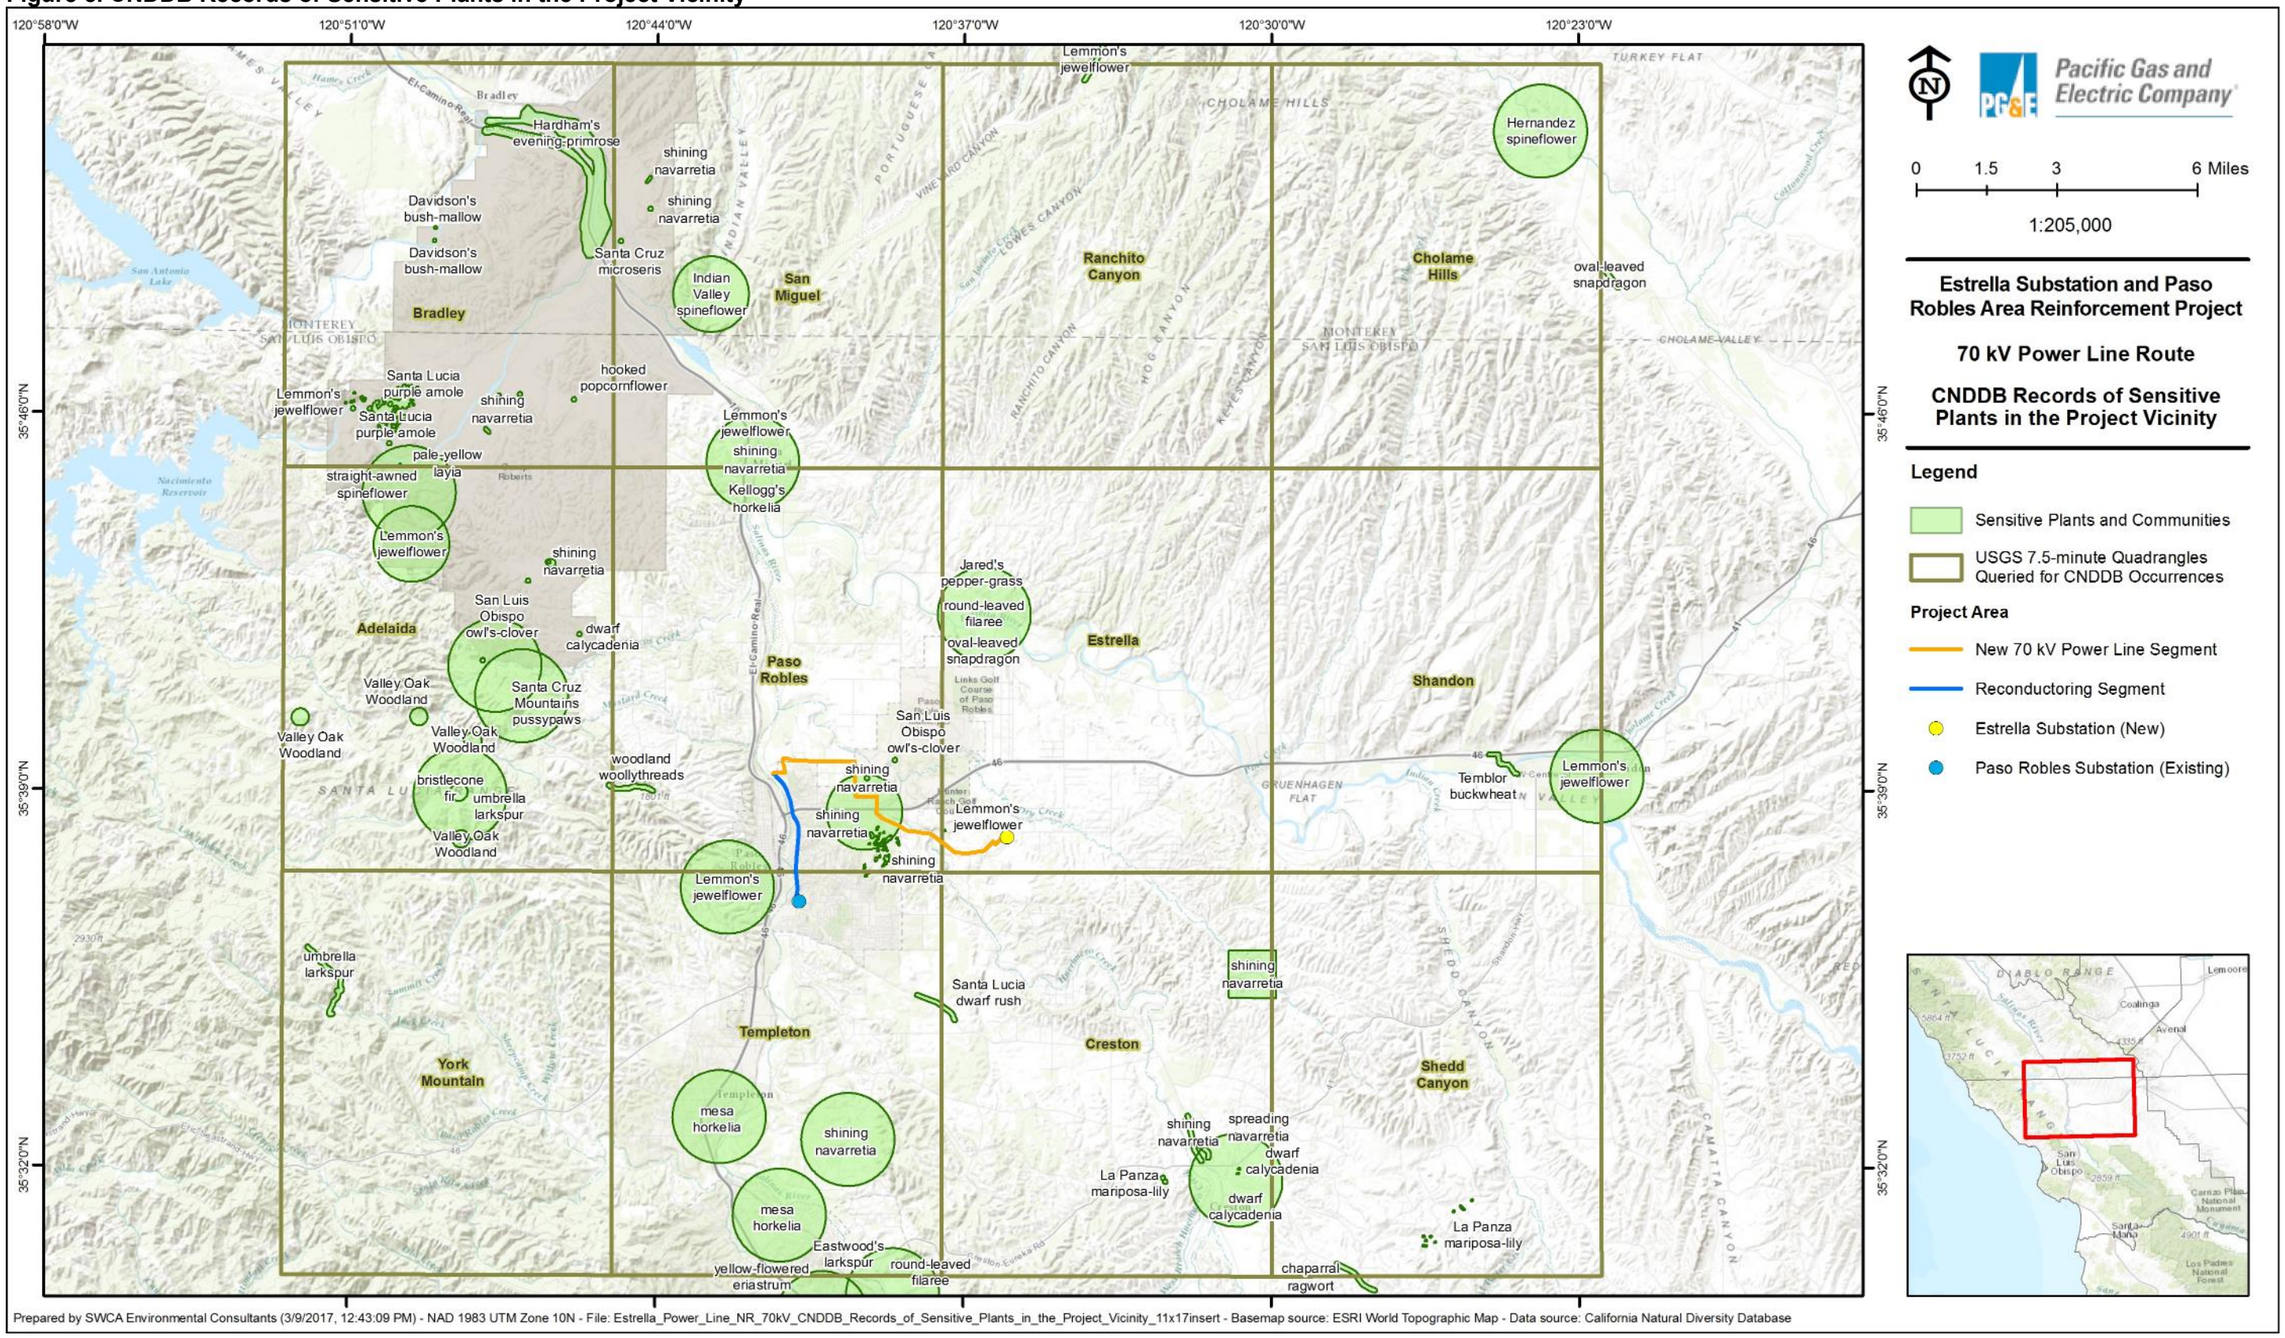
Table 1. Sensitive Plant Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal / State / CRPR[2]	Habitat Associations[3]	Likelihood to Occur in the BSA
Temblor buckwheat *Eriogonum temblorense*	--/--/CRPR 1B.2	Annual herb that occurs in valley grassland. Associated with sandy soils. Blooming period: April–September. Elevation: 300–1,000 meters.	**Potential to occur.** Nonnative grassland and blue oak woodlands may provide habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
Santa Lucia dwarf rush* *Juncus luciensis*	--/--/CRPR 1B.2	Annual grass-like herb that grows in wet, sandy soils of seeps, meadows, vernal pools, streams, roadsides. Fruiting period: April–August. Elevation: 300–2,040 meters.	**Potential to occur.** Drainages and wetland features observed throughout the BSA may provide habitat for this species. One CNDDB occurrence was recorded 3 miles southwest of the project in 1958. Species not observed in the BSA during surveys conducted in the appropriate season.
pale-yellow layia *Layia heterotricha*	--/--/CRPR 1B.1	Annual herb that occurs in cismontane, pinyon and juniper woodland, coastal scrub, and valley and foothill grassland. Associated with open clay or sandy, sometimes +/- alkaline soils. Blooming period: April–June. Elevation: 200–1,800 meters.	**Potential to occur.** Nonnative grassland and central coastal scrub may provide suitable habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.
woodland woollythreads* *Monolopia gracilens*	--/--/CRPR 1B.2	Annual herb that occurs in serpentine grassland, open chaparral, and oak woodland. Blooming period: February–July. Elevation: 100–1,200 meters.	**Potential to occur.** Nonnative grassland and blue oak woodlands may provide suitable habitat for this species. One CNDDB occurrence was recorded 2.39 miles southwest of the project in 1957. Species not observed in the BSA during surveys conducted in the appropriate season.

Table 1. Sensitive Plant Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal / State / CRPR[2]	Habitat Associations[3]	Likelihood to Occur in the BSA
shining navarretia* *Navarretia nigelliformis* ssp. *radians*	--/--/CRPR 1B.2	Annual herb that occurs vernal pools and clay depressions in cismontane woodland and valley and foothill grassland. Blooming period: April–July. Elevation: 76–1,000 meters.	**Potential to occur.** Drainages and wetland features may provide habitat for this species. Four CNDDB occurrences have been recorded within 5 miles of the project, with the most recent occurrences recorded 0.17 mile west and 0.19 mile south-southwest in 2006 and 2014, respectively. Species not observed in the BSA during surveys conducted in the appropriate season.
prostrate vernal pool navarretia *Navarretia prostrata*	--/--/CRPR 1B.1	Annual herb that occurs in alkaline floodplains in vernal pools. Blooming period: April–July. Elevation: <1,210 meters.	**Potential to occur.** Drainages and wetland features may provide habitat for this species. No CNDDB occurrences were recorded within 5 miles of the project. Species not observed in the BSA during surveys conducted in the appropriate season.

[1]List of plant species based on CNPS and CNDDB searches of USGS 7.5-minute quadrangles—Bradley, Adelaida, York Mountain, Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, San Miguel.
[2]Listing status based on CNDDB and CNPS data.
[3]Habitat associations and blooming periods based on the Jepson Online Interchange for California Floristics (Queried in May/June 2016).
*CNDDB occurrences recorded within 5 miles of the project.



Status Codes
-- = No status
FE = Federally listed endangered
FT = Federally listed threatened
FC = Federal candidate for listing
SE = California state-listed endangered
ST = California state-listed threatened
SCE = California candidate endangered

California Rare Plant Ranking:
1A = Plants presumed extirpated in California and either rare or extinct elsewhere
1B = Plants rare, threatened, or endangered in California and elsewhere
2A = Plants presumed extirpated in California, but common elsewhere
2B = Plants rare, threatened, or endangered in California, but more common elsewhere

CRPR Threat Ranks:
0.1 = Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2 = Moderately threatened in California (20-80% of occurrences threatened / moderate degree and immediacy of threat)
0.3 = Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat)

Figure 5. CNDDB Records of Sensitive Plants in the Project Vicinity

This page intentionally left blank

4.4.1.1 ROUND-LEAVED FILAREE

Round-leaved filaree (*California macrophylla;* CRPR 1B.2) is known to occur in valley grassland and foothill woodland communities similar to those observed in the BSA; therefore, it was determined this species has potential to occur. One CNDDB occurrence was recorded 3.15 miles northeast of the project; however, this record dates back to 1937. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.2 LA PANZA MARIPOSA LILY

La Panza mariposa lily (*Calochortus simulans*; CRPR 1B.3) occurs in sandy soils in valley grasslands and foothill woodlands similar to those observed in the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.3 DWARF CALYCADENIA

Dwarf calycadenia (*Calycadenia villosa*; CRPR 1B.1) typically occurs on rocky, dry hills, ridges, grasslands, and openings in foothill woodlands. This habitat was observed in the BSA; therefore, this species was determined to have potential to occur. One CNDDB occurrence was recorded in 2001 approximately 4.76 miles northwest of the project. Suitable habitat for this species is present; however, surveys conducted within the appropriate bloom season did not detect this species in the BSA.

4.4.1.4 HARDHAM'S EVENING-PRIMROSE

Hardham's evening-primrose (*Camissoniopsis hardhamiae*; CRPR 1B.2) is known to occur on sandy soils in oak woodlands such as those observed in the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.5 SAN LUIS OBISPO OWL'S-CLOVER

San Luis Obispo owl's-clover (*Castilleja densiflora* var. *obispoensis*; CRPR 1B.2) is known to occur in grassland areas such as those observed in the BSA; therefore, it was determined this species has potential to occur. One CNDDB occurrence was recorded 0.77 miles west of the project in 2005. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.6 LEMMON'S JEWELFLOWER

Lemmon's jewelflower (*Caulanthus lemmonii;* CRPR 1B.2) is known to occur in grassland and scrub habitat similar to what was observed in the BSA; therefore, it was determined this species has potential to occur. Three CNDDB occurrences have been recorded within 5 miles of the project; however, these occurrences were recorded between 1935 and 1960. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.7 STRAIGHT-AWNED SPINEFLOWER

Straight-awned spineflower (*Chorizanthe rectispina*; CRPR 1B.3) is known to occur in sandy and gravelly soils such as those observed along Huerhuero Creek, unnamed drainage channels, and blue oak woodlands; therefore, is was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.8 HALL'S TARPLANT

Hall's tarplant (*Deinandra halliana;* CRPR 1B.1) is known to occur in grasslands and on open slopes similar to those observed in the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.9 YELLOW-FLOWERED ERIASTRUM

Yellow-flowered eriastrum (*Eriastrum luteum;* CRPR 1B.2) is known to occur in sandy or gravelly soils in cismontane woodland on drying slopes. This habitat was observed in the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted within the appropriate bloom season did not detect this species in the BSA.

4.4.1.10 TEMBLOR BUCKWHEAT

Temblor buckwheat (*Eriogonum temblorense;* CRPR 1B.2) generally occurs in sandy soils in valley grasslands such as those observed in the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.11 SANTA LUCIA DWARF RUSH

Santa Lucia dwarf rush (*Juncus luciensis*; CRPR 1B.2) is known to occur in vernal pools, streams, and along roadsides. These habitats types were observed in the BSA; therefore, it was determined this species has potential to occur. One CNDDB occurrence was recorded approximately 3 miles southwest of the project; however, this record dates back to 1958. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.12 PALE-YELLOW LAYIA

Pale-yellow layia (*Layia heterotricha;* CRPR 1B.1) is known to occur in grassland areas similar to those observed throughout the BSA; therefore, it was determined this species has potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.13 WOODLAND WOOLLYTHREADS

Woodland woollythreads (*Monolopia gracilens*; CRPR 1B.2) is known to occur in grasslands and oak woodlands similar to those observed in the BSA; therefore, it was determined this species has potential to occur. One CNDDB occurrence was recorded 2.39 miles to the west-northwest, but this record dates back to 1957. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.14 SHINING NAVARRETIA

Shining navarretia (*Navarretia nigelliformis* ssp. *radians*; CRPR 1B.2) occurs in vernal pools and clay depressions such as those observed in the BSA; therefore, it was determined this species has potential to occur. Four CNDDB occurrences have been recorded within 5 miles of the project, with the most recent occurrences recorded 0.17 mile west and 0.19 mile south-southwest in 2006 and 2014, respectively. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.1.15 PROSTRATE VERNAL POOL NAVARRETIA

Prostrate vernal pool navarretia (*Navarretia prostrata*; CRPR 1B.1) occurs in alkaline floodplains vernal pools and clay depressions. This habitat was observed in the BSA; therefore, this species was determined to have potential to occur. No CNDDB occurrences were recorded within 5 miles of the project. Suitable habitat for this species is present; however, surveys conducted during the appropriate bloom season did not detect this species in the BSA.

4.4.2 Special-Status Animals

Biologists conducted reconnaissance-level surveys in the BSA to assess the potential for special-status wildlife including those listed by federal and state agencies and others based on available data. The data evaluated included USFWS and CNDDB Species List databases, as well as published and unpublished technical reports and peer-reviewed literature. Reconnaissance-level surveys included documentation of animals, vegetation communities, and land cover types. Habitat was evaluated for potential to support those special-status species identified during the desktop review, and detailed notes and photographs (Appendix C) were taken to support determinations of the likelihood for those species to occur within the BSA. The BSA was examined for presence or signs of occupation by special-status species (e.g., footprints, scat, feathers, or burrows) and auditory information (for example specific vocalizations of birds). Binoculars were also used to facilitate identification of species.

Two special-status animals—loggerhead shrike (CDFW SSC) and bald eagle (state endangered and CDFW fully protected)—were observed foraging and flying within the BSA during surveys conducted in April and June 2016. A complete list of wildlife identified during the surveys is located in Appendix B, Fauna Compendium. Thirty-four special-status animals have occurrence records within the 12 USGS 7.5-minute topographic quadrangles at and surrounding the project. Due to site-specific conditions, it was determined that 2 animals are present, 9 animals are likely to occur, 10 animals have potential to occur, and 6 animals are unlikely to occur within the BSA (Table 3). The remaining 7 animals were determined to be absent from the BSA based on the lack of suitable habitat or because the BSA is located outside of the species range. Species that were determined to be unlikely to occur (California tiger salamander [*Ambystoma californiense*], tricolored blackbird [*Agelaius tricolor*], Swainson's hawk [*Buteo swainsoni*], California condor [*Gymnogyps californianus*], Townsend's big-eared bat [*Corynorhinus townsendii*], and Tulare grasshopper mouse [*Onychomys torridus tularensis*]) or absent from the BSA are not discussed further in this report. Species that were determined to be present, seasonally present, have potential to occur, or are likely to occur within the BSA are discussed below. Special-status wildlife species occurrences recorded in the CNDDB (CDFW 2016a) are depicted in Figure 7.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal/ State/Other[2]	Habitat Associations	Likelihood of Occurrence
INVERTEBRATES			
vernal pool fairy shrimp* *Branchinecta lynchi*	FT/--/--	Vernal pool habitats including depressions in sandstone, to small swale, earth slump, or basalt-flow depressions with a grassy or, occasionally, muddy bottom in grassland.	**Likely to occur.** Seasonal wetlands observed throughout the BSA may provide suitable habitat for this species. Three recent CNDDB occurrences (2001, 2001, and 2005) were recorded within 2 miles of the project.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal/ State/Other[2]	Habitat Associations	Likelihood of Occurrence
AMPHIBIANS			
California red-legged frog *Rana draytonii*	FT/--/SSC	Semi-permanent or permanent water at least 0.5 meter deep, bordered by emergent or riparian vegetation, and upland grassland, forest or scrub habitats for refugia and dispersal.	**Potential to occur.** Suitable aquatic breeding, non-breeding, and upland habitat observed in the BSA. No CNDDB occurrences were recorded within 5 miles of the project.
western spadefoot* *Spea hammondii*	--/--/SSC	Grasslands and valley foothill woodlands, with vernal pools that are used for breeding. Outside of breeding season, they burrow in upland areas.	**Likely to occur.** Suitable breeding and upland habitat observed in the BSA. Four CNDDB occurrences were recorded between 2002 and 2006 within 4 miles of the project.
REPTILES			
silvery legless lizard* *Anniella pulchra pulchra*	--/--/SSC	Dune scrub, coastal scrub, chaparral, pine-oak woodland, oak woodland, and riparian woodland. Requires loose soil for burrowing, moisture, warmth, and plant cover. Burrows in washes, dune sand, loose soil near bases of slopes, and near permanent or temporary streams.	**Potential to occur.** Suitable habitat observed in the BSA. One CNDDB occurrence was recorded 4.59 miles northwest of the project in 1994.
western pond turtle* *Emys marmorata*	--/--/SSC	Found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with basking sites.	**Likely to occur.** Suitable aquatic habitat observed in the BSA. Two CNDDB occurrences (2005 and 2006) were recorded within 2 miles of the project, near the Salinas river.
San Joaquin whipsnake *Coluber flagellum ruddocki (Masticophis flagellum ruddocki)*	--/--/SSC	Chaparral and scrub habitats but will also use adjacent grassland, oak savanna and woodland habitats; will inhabit abundant rodent burrows.	**Potential to occur.** Suitable habitat observed in the BSA. No CNDDB occurrences were recorded within 5 miles of the project.
coast horned lizard *Phrynosoma blainvillii*	--/--/SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes; open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	**Likely to occur.** One coast horned lizard was observed by biologists in March 2016 approximately 0.5 milesnortheast of Estrella Substation in Dry Creek. Sandy creek beds in the BSA may provide suitable habitat for this species.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal/ State/Other[2]	Habitat Associations	Likelihood of Occurrence
BIRDS			
golden eagle *Aquila chrysaetos*	--/--/FP; MBTA; BGEPA	Broad expanses of open country are required for foraging while nesting primarily occurs in rugged mountainous areas with large trees or on cliffs.	**Likely to occur.** Suitable nesting and foraging habitat observed in the BSA. CNDDB reports an active nest 0.22 miles east of the project in 2006.
burrowing owl *Athene cunicularia*	--/--/SSC; MBTA	Open, dry, annual, or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Uses rodent or other burrow for roosting and nesting cover.	**Potential to occur.** Suitable habitat observed throughout the BSA. No CNDDB occurrences were recorded within 5 miles of the project.
northern harrier *Circus cyaneus*	--/--/SSC; MBTA	Frequents meadows, grasslands, open rangeland, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas.	**Likely to occur.** Suitable foraging habitat was observed in the BSA**.** No CNDDB occurrences were recorded within 5 miles of the project; however, multiple sightings have been recorded on eBird between 2006 and 2016 within 2 miles of the project.
white-tailed kite *Elanus leucurus*	--/--/FP; MBTA	Yearlong resident in coastal and valley lowlands; rarely away from agricultural areas. Inhabits herbaceous and open staged of moist habitats mostly in cismontane areas	**Likely to occur.** Suitable nesting and foraging habitat was observed in the BSA**.** No CNDDB occurrences were recorded within 5 miles of the project; however, multiple sightings have been recorded on eBird between 1988 and 2006 within 2 miles of the project.
bald eagle *Haliaeetus leucocephalus*	DL/SE/FP; MBTA; BGEPA	Roosts communally in winter in dense, sheltered, remote conifer stands. Nests in large, old growth, or dominant live tree close to lakes and large rivers.	**Present.** Biologist observed one juvenile bald eagle soaring above the project near Golden Hill Road in June 2016. In addition, six bald eagle sightings were recorded within the vicinity of the project between 2006 and 2015 (eBird 2016). Suitable nesting and foraging habitat for this species was observed in the BSA.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal/ State/Other[2]	Habitat Associations	Likelihood of Occurrence
loggerhead shrike *Lanius ludovicianus*	--/--/SSC; MBTA	Generally occurs in open country with scattered shrubs and trees. Sit on low perches to scan for prey (rodents, lizards, birds, and insects).	**Present.** Several loggerhead shrike were observed in grassland and agricultural areas in the BSA along Union Road. These individuals were observed perched on electrical power lines and foraging in the adjacent fields. Suitable nesting and foraging habitat was observed in the BSA.
purple martin *Progne subis*	--/--/SSC; MBTA	Uncommon to rare, local summer resident in a variety of wooded, low-elevation habitats. Forages over riparian areas, forest, and woodland, and found in a variety of open habitats in migration.	**Potential to occur.** Suitable nesting and foraging habitat was observed in the BSA. Two individuals were observed 2.7 miles north of the project in 1991 (eBird 2016).
yellow warbler *Setophaga petechia*	--/--/SSC; MBTA	Breed in shrubby thickets and woods near riparian areas and wetlands. This species migrates south to Central and South America for the winter.	**Likely to occur.** Suitable nesting and foraging habitat exist along Salinas River that parallels the western portion of the project. Several individuals were observed within 0.25 miles of the interconnection point of the new 70 kV power line and reconductoring segments in 2014 (eBird 2016).
least Bell's vireo* *Vireo bellii pusillus*	FE/SE/MBTA	Summer resident of cottonwood-willow forest, oak woodland, shrubby thickets, and dry washes with willow thickets at the edges. Requires dense ground (2-3 feet) cover for nesting, and stratified canopy for foraging.	**Potential to occur.** Suitable foraging and nesting habitat was observed at the western end of the new 70 kV power line segment along Salinas River. Two CNDDB occurrences were recorded within 5 miles of the project, with the closest and most recent (2005) occurrence located approximately 0.60 mile north-northwest from the project along Salinas River.
MAMMALS			
pallid bat *Antrozous pallidus*	--/--/SSC	True desert areas, moister oak woodlands, and redwood forests of coastal regions. At lower elevations, highly associated with oak woodlands and oak savannah.	**Potential to occur.** Potential day and night roost sites were observed within the BSA. No CNDDB occurrences were recorded within 5 miles of the project.

Table 2. Sensitive Wildlife Species Potential for Occurrence within the BSA[1]

Common Name *Scientific Name*	Status Federal/ State/Other[2]	Habitat Associations	Likelihood of Occurrence
Monterey dusky-footed woodrat *Neotoma macrotis luciana*	--/--/SSC	Dense chaparral, coastal sage-scrub, pinyon- juniper, oak and riparian woodlands, and mixed coniferous forest habitat with well- developed understory in which to make its nest.	**Potential to occur.** Suitable habitat observed within the BSA. No CNDDB occurrences were recorded within 5 miles of the project; however, biologists observed one woodrat midden outside of the BSA, approximately 0.5 miles north of the project along Dry Creek.
Salinas pocket mouse* *Perognathus inornatus psammophilus*	--/--/SSC	Habitat relations are not well known but literature reported habitat for *P. inornatus* on the Carrizo Plain (previously considered to include *psammophilus*) as sandy loam flats dominated by herbs and grasses.	**Potential to occur.** Suitable habitat observed within and adjacent to Huerhuero Creek. The nearest CNDDB occurrence was recorded 3.2 miles north of the project in 1918.
American badger* *Taxidea taxus*	--/--/SSC	Open grassland, chaparral, and oak woodland with friable soils. Needs sufficient food and open, uncultivated ground.	**Likely to occur.** Suitable habitat present within the BSA. The nearest CNDDB occurrence was recorded approximately 3 miles southwest of the project in 2003.
San Joaquin kit fox* *Vulpes macrotis mutica*	FE/ST/--	Open, level areas with loose-textured soils supporting scattered, shrubby vegetation with little human disturbance represent suitable habitats for kit foxes. Some agricultural areas may support these foxes.	**Potential to occur.** Suitable habitat observed within the BSA. The nearest CNDDB occurrence was recorded 0.34 mile southwest of the project in 1991. Three additional occurrences have been recorded within 5 miles of the project between 1985 and 1990.

[1]List of animal species based on CNDDB searches of USGS 7.5-minute quadrangles – Bradley, Adelaida, York Mountain, Estrella, Paso Robles, Templeton, Creston, Shedd Canyon, Shandon, Cholame Hills, Ranchito Canyon, San Miguel.
[2]Listing status based on CDFW CNDDB State & Federally Listed Endangered & Threatened Animals of California List, April 2016.
[3]The California tiger salamander Santa Barbara County and Sonoma County Distinct Vertebrate Population (DPS) is listed as Federally Endangered. The Central Valley Population is designated as Threatened (Bolster 2010).
*CNDDB occurrences recorded within 5 miles of the project.

Status Codes
-- = No Status
FE = Federally Listed Endangered
FT = Federally Listed Threatened
FC = Federal Candidate for Listing
SE = California State-Listed Endangered
ST = California State-Listed Threatened
SCE = California Candidate Endangered
DL = Delisted
FP = CDFW Fully Protected
SSC = CDFW Species of Special Concern

4.4.2.1 VERNAL POOL FAIRY SHRIMP

As mentioned in Section 4.2.1, critical habitat for vernal pool fairy shrimp (*Branchinecta lynchi*) occurs along the eastern-most 2 miles of the project, between Estrella Substation and SR-46 within the designated area known as Unit 29C, Central Coast Range Region (Figure 4). Habitat constituents that are required to support this species, including wetland features within a matrix of upland habitat, occur in two different areas of the BSA: a) two seasonal wetlands with vernal pool indicator species (i.e., coyote thistle [*Eryngium vaseyi*]) located approximately 200 feet east of Buena Vista Drive, and b) a seasonal wetland approximately 1,200 feet northeast of the interconnection point of the new 70 kV power line segment and the reconductoring segment (Appendix E). There are no recorded occurrences of vernal pool fairy shrimp in or around either of these features.

Three CNDDB occurrences have been recorded within approximately 5 miles of the project between 2001 and 2005. The closest occurrences were recorded in 2005, approximately 0.44 miles west of the project site near the intersection of Niblick Road and Spring Street in small depressions and pools along a gravel access road, and in 2001, approximately 0.45 miles north of Estrella Substation and just south of SR-46 in a vernal pool. Because of the presence of suitable habitat and proximity to documented occurrences, vernal pool fairy shrimp are likely to occur in the BSA.

4.4.2.2 CALIFORNIA RED-LEGGED FROG

A site assessment for California red-legged frog (*Rana draytonii*) was conducted in November 2016 and followed the "*Revised Guidance on Site Assessment and Field Surveys for California Red-legged Frogs* (Guidance)," issued by the USFWS. A total of 18 sites were preliminarily identified in aerial photography and ten sites were surveyed. Based on the presence of aquatic predators (i.e., American bullfrogs [*Lithobates catesbeianus*] and centrarchid fishes) and/or a lack of emergent vegetation, nine of the ten survey areas were determined to have either no potential or an unlikely potential to support a breeding population of California red-legged frogs (Table 3). The tenth surveyed area (S6), located approximately 0.7 miles north of the project, has suitable aquatic breeding and adjacent upland habitat for California red-legged frogs. This drainage feature contains still to slow flowing water with dense stands of emergent vegetation and an overhanging canopy cover. However, the drainage features water source is run-off and overflow from Hunter Ranch Golf Course and therefore is subject to human influence (e.g., water flow/discharge control and pesticides). The nearest known breeding occurrence to this drainage feature is approximately 9 miles to the south, near the confluence of Salinas River and Graves Creek.

Seven additional ponds were observed within 1 mile of the project; however, access to these areas was prohibited. One of the locations, River Oaks Golf Course (S11a and S11b), was previously surveyed for California red-legged frog in 1999 and 2007; however, no individuals were observed. Several bullfrog adults and tadpoles were observed in the pond during the 2007 surveys and the studies concluded that California red-legged frogs are very unlikely to occur at River Oaks Golf Course (Althouse and Meade, Inc. 2013).

The remaining un-surveyed aquatic features within 1 mile of the project consisted of one freshwater pond (S8) and four manmade ponds on two separate golf courses (S4, S14a, S14b, and S14c). The nearest recorded occurrences of California red-legged frog range from 6 to 9 miles south, along the Salinas River riparian corridor.

Based on the findings from the California red-legged frog site assessment and documented occurrences in the region, red-legged frogs have potential to occur in the BSA. Table 3 summarizes the findings from the California red-legged frog site assessment, and survey data sheets are provided in Appendix F. All aquatic features included in the California red-legged frog site assessment are shown below in Figure 6. No California red-legged frog CNDDB occurrences have been recorded within 5 miles of the project.

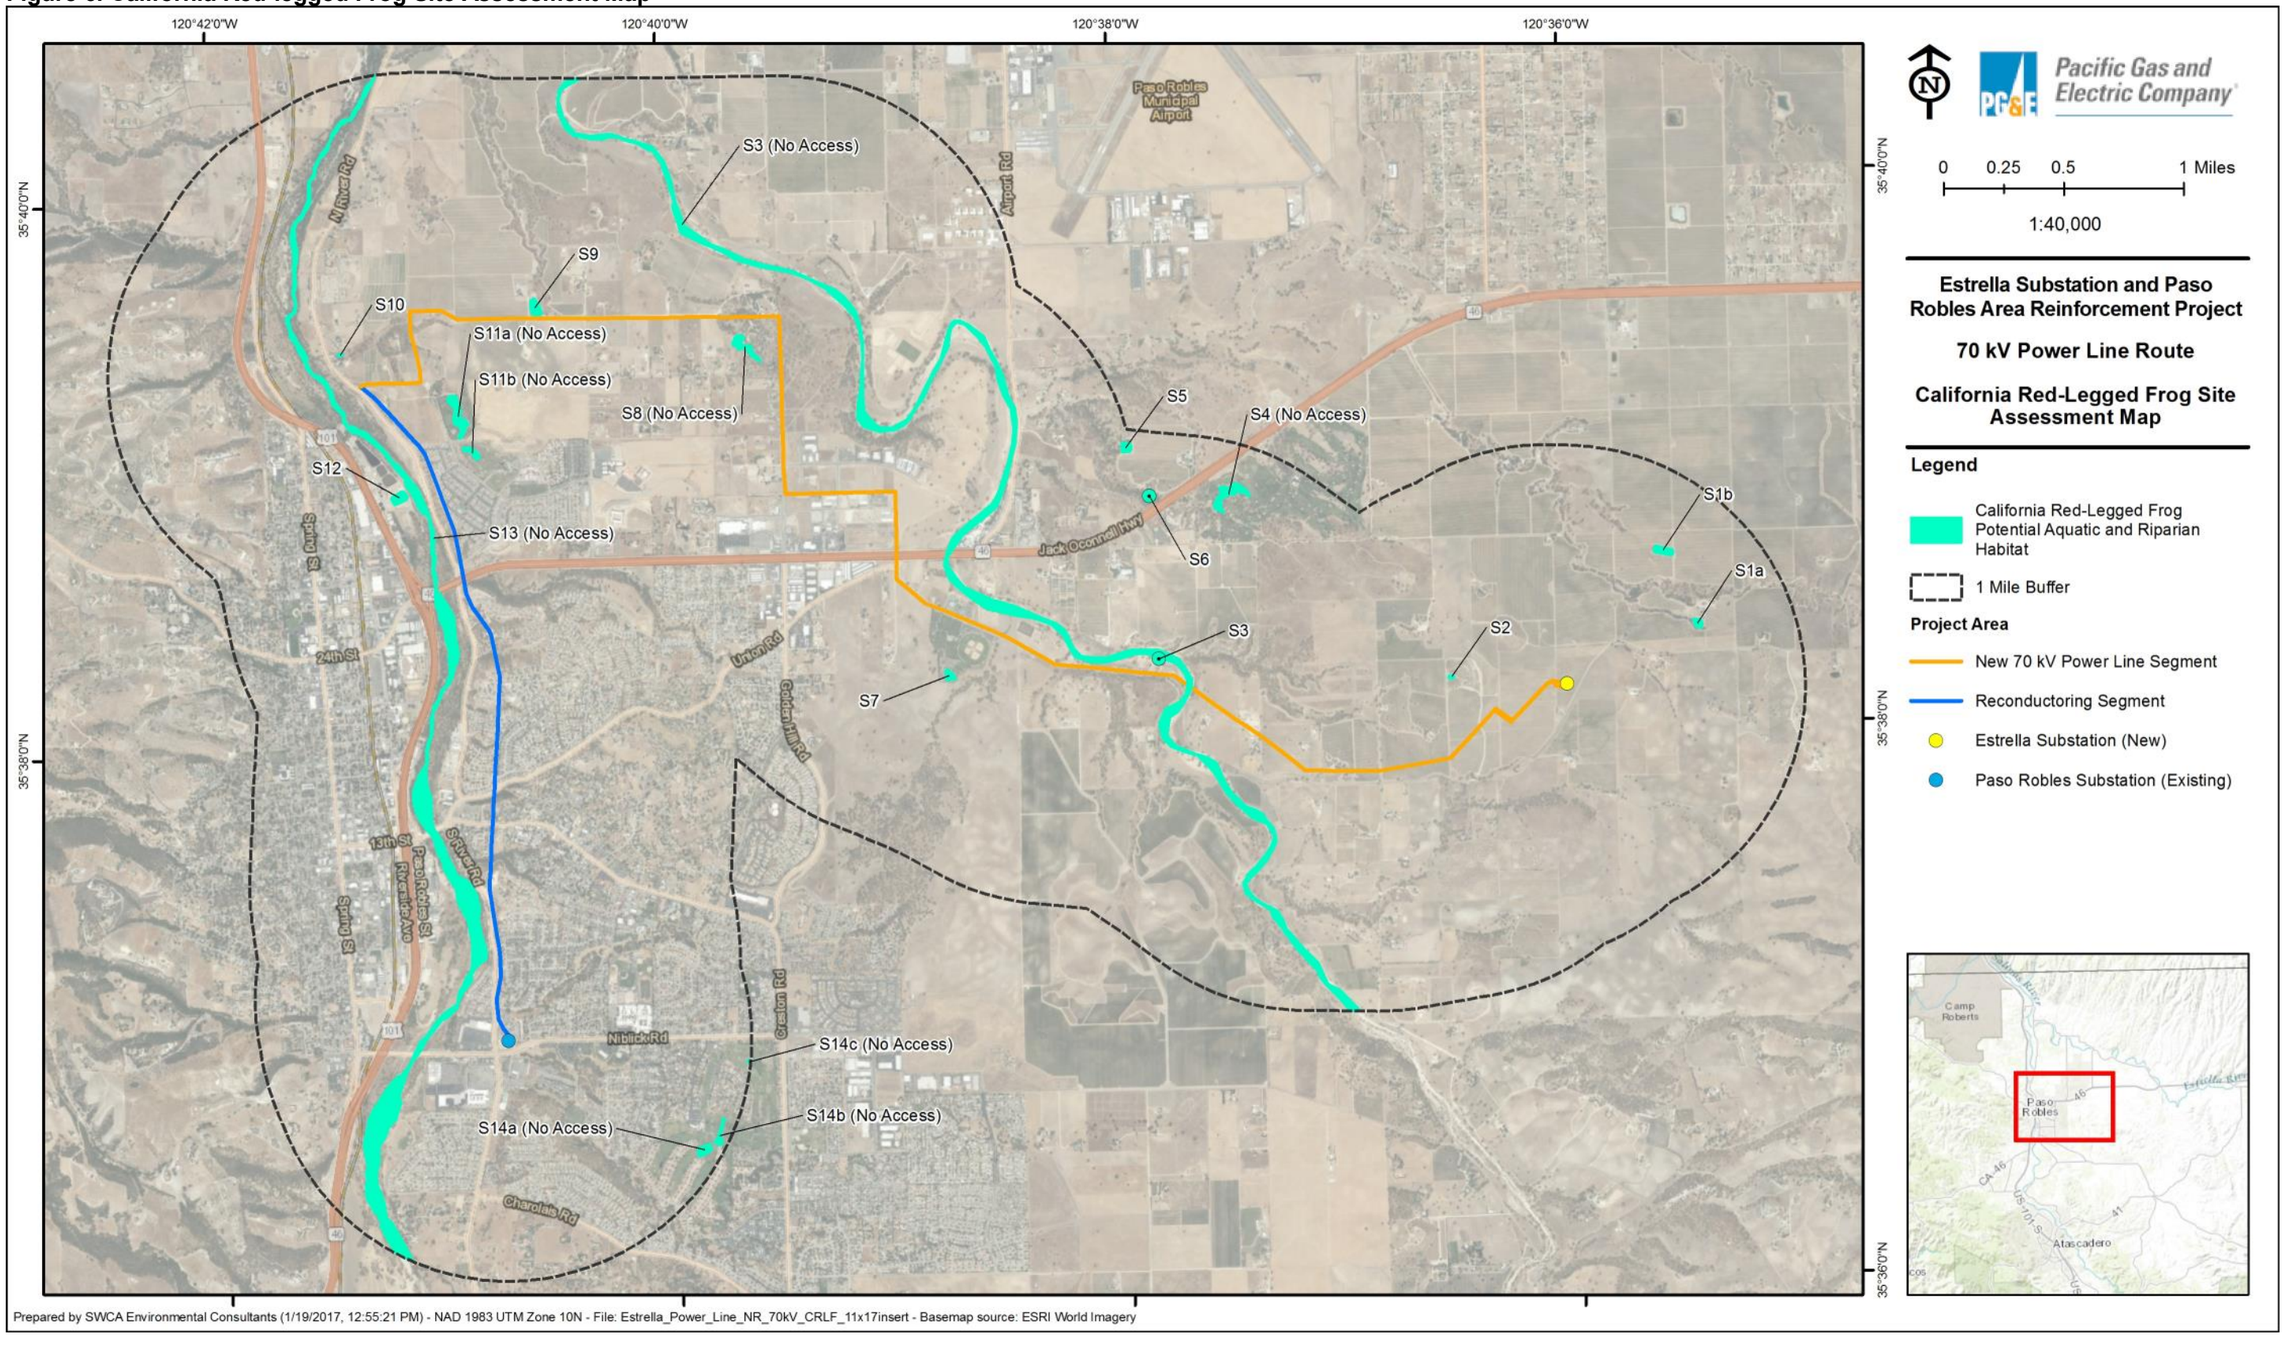

Table 3. California Red-legged Frog Site Assessment

Survey Location	CRLF Present?	Emergent Vegetation Present?	Aquatic Predators Present?	Distance to the Nearest CRLF Occurrence (miles)	Notes
S1a	No	Yes (bulrush, juncus)	Yes (largemouth bass, bluegill)	9.8	Manmade perennial pond (13 feer deep) stocked with centrarchid fishes over 30 years ago. Surrounding land use consists of intensive agricultural production.
S1b	No	Yes (bulrush)	Yes (largemouth bass, bluegill)	10.0	Manmade perennial pond (10 feet deep) stocked with centrarchid fishes over 30 years ago. Surrounding land use consists of intensive agricultural production.
S2	No	No	No	9.1	Manmade perennial pond lined with Visqueen plastic. Strong odor and oily sheen on the surface. Surrounding land use consists of intensive agricultural production.
S3	No	No	No	8.5	Huerhuero Creek is an ephemeral creek with a sandy substrate. No water was present at the time of the site visit. Adjacent upland habitat is present.
S4	N/A	N/A	N/A	9.2	No access.
S5	No	Yes (cattail, juncus)	Yes (largemouth bass, other fish)	9.2	Manmade perennial pond (less than 8 feet deep) with a high density of fish. One northern pacific tree frog (*Pseudacris regilla*) was heard calling from the pond. Adjacent upland habitat is present.
S6	No	Yes (cattail, juncus, willow, duckweed)	No	9.1	This ephemeral drainage channel receives overflow water from Hunter Ranch Golf Course, potentially resulting in standing and slow flowing water year round. One northern pacific tree frog was heard calling from the drainage. Adjacent upland habitat is present.
S7	No	No	No	8.1	Manmade perennial pond in a Barney Schwartz Park with an artificial rocky substrate. High density of red-eared slider turtles (*Trachemys scripta elegans*). Adjacent upland habitat is present.
S8	N/A	N/A	N/A	9.1	No access.

Table 3. California Red-legged Frog Site Assessment

Survey Location	CRLF Present?	Emergent Vegetation Present?	Aquatic Predators Present?	Distance to the Nearest CRLF Occurrence (miles)	Notes
S9	No	Yes (cattail)	Unknown	9.1	Locked gate surrounding pond prevented direct access to pond. Water visibility is poor. Cattail along the banks is dying off due to receding water line. Adjacent upland habitat is present.
S10	No	Yes (cattail)	Yes (largemouth bass, other fish, bullfrogs)	8.8	Perennial pond is fed by a warm sulfuric spring and is located within a drainage channel that empties into Salinas River. Water is warm and contains a high density of American bullfrog. Adjacent upland habitat is present.
S11a	N/A	N/A	N/A	8.5	No access.
S11b	N/A	N/A	N/A	8.4	No access.
S12	No	Yes (cattail, willow)		8.2	Site consists of a manmade groundwater basin that contains beaver, crayfish, and waterfowl. An adjacent manmade perennial drainage was created to drain the warm spring (used to heat the wastewater treatment facility) into Salinas River.
S13	N/A	N/A	N/A	8.1	No access.
S14a	N/A	N/A	N/A	5.9	No access.
S14b	N/A	N/A	N/A	5.9	No access.
S14c	N/A	N/A	N/A	6.3	No access.

Figure 6. California Red-legged Frog Site Assessment Map

This page intentionally left blank

4.4.2.3 WESTERN SPADEFOOT TOAD

Four western spadefoot toad (*Spea hammondii*) CNDDB occurrences have been recorded between 2002 and 2006 within 5 miles of the project. The closest occurrence was recorded in 2002 approximately 1.25 miles south of the project near Huerhuero Creek. Although this species was not observed during the field surveys, seasonal wetlands, Huerhuero Creek, Central Coast cottonwood-willow riparian habitat along Salinas River, and other ephemeral drainages as well as nearby grasslands in the BSA may provide suitable habitat for this species. Because of the presence of suitable aquatic and upland habitat and proximity to documented occurrences, western spadefoot toads are likely to occur in the BSA.

4.4.2.4 SILVERY LEGLESS LIZARD

One silvery legless lizard (*Anniella pulchra pulchra*) CNDDB occurrence was recorded 4.6 miles northwest of the project in 1994. Although this species was not observed during the survey period, areas with leafy debris and loose soil, including the sandbars of Huerhuero Creek, Central Coast cottonwood- willow riparian habitat along Salinas River, and other ephemeral drainages were observed within the BSA. Because of the presence of habitat and proximity to documented occurrences, silvery legless lizards have potential to occur in the BSA.

4.4.2.5 WESTERN POND TURTLE

Two western pond turtle (*Emys marmorata)* CNDDB occurrences (2005 and 2006) have been recorded within 2 miles of the project, with the nearest occurrence recorded 0.17 miles west of the project along Salinas River. In the BSA, western pond turtle could occur in the freshwater ponds, retention ponds, coastal and valley freshwater marsh habitat, or Central Coast cottonwood-willow riparian habitat along the Salinas River. The species could find refugia in upland areas near these habitats. Because of the presence of habitat and proximity to documented occurrences, western pond turtles have potential to occur in aquatic habitats and adjacent upland areas within the BSA.

4.4.2.6 SAN JOAQUIN WHIPSNAKE (COACHWHIP)

No San Joaquin whipsnake (*Coluber flagellum ruddocki [=Masticophis flagellum ruddocki]*) CNDDB occurrences have been recorded within 5 miles of the project. An abundance of small mammal burrows was observed in grasslands and other dry open areas in the BSA. Because of the presence of habitat and proximity to documented occurrences, San Joaquin whipsnakes have potential to occur in the BSA.

4.4.2.7 COAST HORNED LIZARD

No coast horned lizard (*Phrynosoma blainvillii*) CNDDB occurrences have been recorded within 5 miles of the project; however, one coast horned lizard was observed by biologists in March 2016 outside of the BSA, approximately 0.5 miles northeast of Estrella Substation in Dry Creek. Sandy creek beds in the BSA, such as those observed in Huerhuero Creek and the unnamed drainage northwest of Golden Hill Road, may provide suitable habitat for this species. Because of the presence of habitat and proximity to documented occurrences, coast horned lizards are likely to occur in the BSA.

4.4.2.8 GOLDEN EAGLE

One golden eagle (*Aquila chrysaetos*) CNDDB occurrence has been recorded approximately 0.20 miles north of the project in 2006 on the west side of Huerhuero Creek in a blue oak tree, between Golden Hill Road and Airport Road. According to the CNDDB record, a golden eagle pair has been seen nesting at this particular location for at least 15 years, and a second unoccupied nest was observed in the vicinity. In addition, multiple sightings were recorded within Paso Robles city limits between 1982 and 2015, with the closest observation to the project site being at Cuesta College North Campus just north of SR-46 (eBird 2016). Expansive spreads of grassland and oak woodlands within and around the BSA may provide quality

foraging and nesting habitat for this species. Because of the presence of nesting and foraging habitat and proximity to documented occurrences, golden eagles are likely to occur in the BSA.

4.4.2.9 BURROWING OWL

No burrowing owl (*Athene cunicularia*) CNDDB occurrences have been recorded within 5 miles of the project. An abundance of small mammal burrows was observed in grasslands and other dry open areas in the BSA, which may provide suitable habitat for this species (Burrowing Owl Conservation Network 2016). Because of the presence of habitat and proximity to documented occurrences, burrowing owls have potential to occur in the BSA.

4.4.2.10 NORTHERN HARRIER

While no CNDDB records were listed in the 12-quadrangle CNDDB search, multiple northern harrier (*Circus cyaneus*) sightings have been recorded between 2006 and 2016 within 2 miles of the project, with the closest and most recent (2016) observation located at River Oaks Pond near Clubhouse Drive, approximately 1,000 feet east of the reconductoring segment (eBird 2016). Because of the presence of suitable nesting and foraging habitat and proximity to documented occurrences, northern harriers are likely to occur in the BSA.

4.4.2.11 WHITE-TAILED KITE

While no CNDDB records were listed in the 12-quadrangle CNDDB search, nine white-tailed kite (*Elanus leucurus*) sightings have been recorded between 1988 and 2006 within 1 mile of the project, with the closest and most recent observation located approximately 0.50 miles west of the reconductoring segment in 2006 (eBird 2016). Because of the presence of suitable nesting and foraging habitat and proximity to documented occurrences, white-tailed kites are likely to occur in the BSA.

4.4.2.12 BALD EAGLE

Six bald eagle (*Haliaeetus leucocephalus*) sightings have been recorded within 2 miles of the project between 2006 and 2015 (eBird 2016). Biologists observed one juvenile bald eagle soaring within 0.25 milesof the project near Golden Hill Road on June 15, 2016. Suitable nesting and foraging habitat was observed within the BSA. Although no bald eagle nests were observed during the 2016 field surveys, one juvenile eagle was observed; therefore, this species was determined to be present in the BSA.

4.4.2.13 LOGGERHEAD SHRIKE

Numerous loggerhead shrike (*Lanius ludovicianus*) were observed in grassland and agricultural areas in the BSA, most abundantly along Union Road. These individuals were observed perched on electrical power lines and foraging in the adjacent fields. Although no nesting loggerhead shrike were observed in the BSA, suitable nesting habitat for this species was observed. Based on the observations during the 2016 reconnaissance-level surveys, this species is present in the BSA.

4.4.2.14 PURPLE MARTIN

There are no purple martin (*Progne subis*) CNDDB occurrences recorded within the 12-quadrangle search; however, two individuals were observed approximately 2.7 miles north of the project near the intersection of Wellsona Road and Airport Road in 1991 (eBird 2016). Natural and urban landscapes in the BSA may provide suitable nesting and foraging habitat for this species. Because of the presence of suitable habitat and proximity to documented occurrences, purple martins have potential to occur in the BSA between April and August.

4.4.2.15 YELLOW WARBLER

Twenty-one sightings of yellow warbler (*Dendroica petechial*) were recorded in 2014 at River Oaks Pond approximately 1,000 feet east of the reconductoring segment (eBird 2016). Yellow warbler usually arrive in California in April to breed along watercourses and wetlands from mid-April into early August with a peak in June, and leave by October (CDFW 2016d). Central Coast cottonwood-willow riparian forest observed along Salinas River in the northwest portion of the BSA may provide suitable nesting habitat for this species. In addition, summer migrants may use woodlands within the BSA as foraging habitat. Because of the presence of suitable nesting and foraging habitat and proximity to documented occurrences, yellow warblers are likely to occur in the BSA between April and October.

4.4.2.16 LEAST BELL'S VIREO

Two least Bell's vireo (*Vireo bellii pusillus*) CNDDB occurrences have been recorded within 5 miles of the project, with the closest and most recent (2005) occurrence located approximately 0.60 miles north-northwest from the project along Salinas River. No other sightings have been recorded in eBird, and this species was not observed during the survey period. Least Bell's vireo typically arrive in California during mid- to late-March and remain in their breeding grounds until September, at which time they migrate south (CDFW 2016d). Suitable nesting and foraging habitat exists along Salinas River that parallels the western portion of the project. Because of the presence of suitable nesting and foraging habitat and proximity to documented occurrences, least Bell's vireos have potential to occur in the BSA, limited to Salinas River, between March and September.

4.4.2.17 PALLID BAT

No pallid bat (*Antrozous pallidus*) CNDDB occurrences have been recorded within 5 miles of the project. Blue oak woodlands, grasslands, and urban portions of the BSA may provide suitable roosting and foraging habitat for this species. Because of the presence of suitable roosting and foraging habitat, pallid bat have potential to occur in the BSA.

4.4.2.18 MONTEREY DUSKY-FOOTED WOODRAT

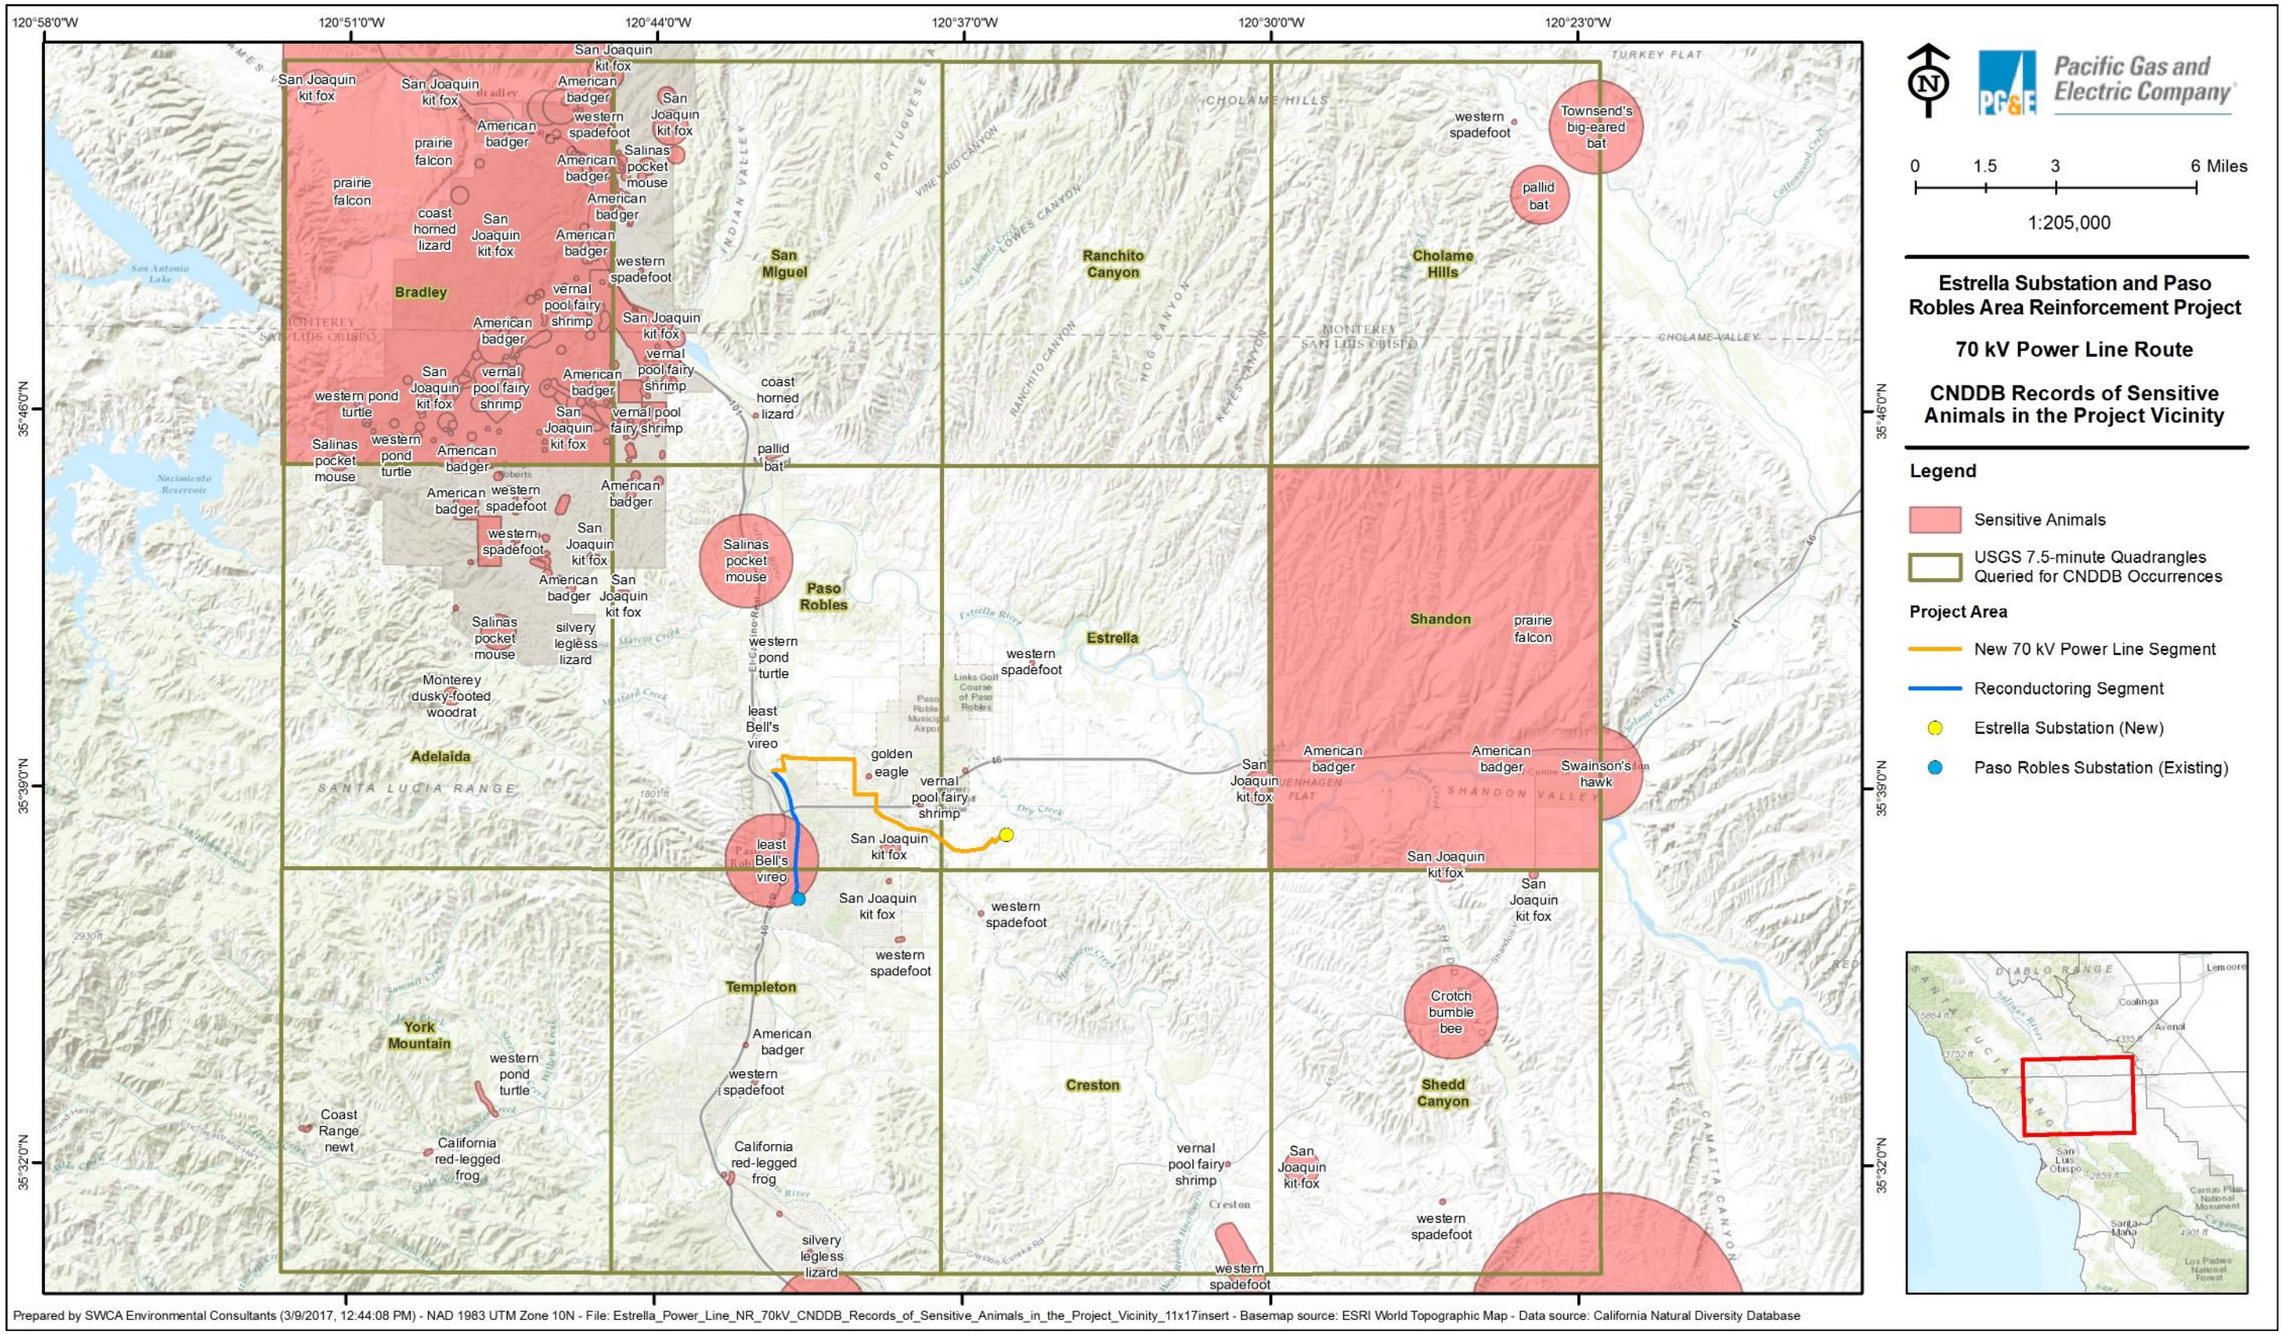
No Monterey dusky-footed woodrat (*Neotoma macrotis luciana*) CNDDB occurrences have been recorded within 5 miles of the project. Biologists observed one woodrat midden in March 2016 while conducting surveys for Estrella Substation. The midden was observed outside of the BSA, approximately 0.5 miles north of Estrella Substation along Dry Creek. Central Coast cottonwood-willow riparian forest and riparian areas in the BSA may provide suitable habitat for this species. Because of the presence of suitable habitat and proximity to documented occurrences, Monterey dusky-footed woodrats have potential to occur in the BSA.

4.4.2.19 SALINAS POCKET MOUSE

Salinas pocket mouse (*Perognathus inornatus psammophilus*), a CDFW SSC, occurs in annual grasslands, desert scrub, and woodland communities on sandy soils and other friable soils. Salinas pocket mouse is a nocturnal species spending the days underground in a burrows covered by soil (Brylski 1998).

One Salinas pocket mouse CNDDB occurrence has been recorded within 5 miles of the project; however, this record dates back to 1918. Blue oak woodland and grassland areas with sandy and other friable soils in the BSA may provide suitable habitat for this species. Because of the presence of suitable habitat and proximity to documented occurrences, Salinas pocket mice have potential to occur in the BSA.

4.4.2.20 AMERICAN BADGER



While several dozen American badger (*Taxidea taxus*) records were listed in the 12-quadrangle CNDDB search, the nearest occurrence (2003) was recorded 3.2 miles to the southwest in annual grassland habitat. Nonnative grasslands and blue oak woodlands observed throughout the BSA may provide suitable habitat for this species. In addition, an abundance of prey species is present within and around the BSA, such as California ground squirrels (*Otospermophilus beecheyi*) and other small rodent species. Because of the presence of suitable habitat and the abundance of documented occurrences, American badger are likely to occur in the BSA.

4.4.2.21 SAN JOAQUIN KIT FOX

Over 40 San Joaquin kit fox (*Vulpes macrotis mutica*) CNDDB occurrences were recorded in the 12-quadrangle search between 1971 and 2012, most of which have been recorded at Camp Roberts more than 8 miles to the north. One kit fox is known to have moved from Camp Roberts, approximately 12 miles northwest of the project, to the Carrizo Plain, located 40 miles southeast of the project (California State University, Stanislaus 2016). The last recorded San Joaquin kit fox occurrence in Camp Roberts was in 2004. Natural connections between the Salinas River and Pajaro River watersheds, the Carrizo Plain Natural Area, and the San Joaquin Valley provide migration corridors for San Joaquin kit fox; however, the amount of movement between these areas is unknown. Salinas River, which bisects the Salinas River Valley and parallels the reconductoring segment of the project, is contiguous with off-site open space areas to the north and south. Huerhuero Creek, which bisects the project near its intersection with SR-46, is also connecting off-site natural open space areas to the northwest and southeast. These features may function as corridors, allowing free movement of kit fox. Deer fences observed throughout the BSA may provide migration barriers for San Joaquin kit fox throughout the BSA, especially in agricultural areas; however, there are no known significant barriers to dispersal or migration between the documented populations of San Joaquin kit fox in the Shandon Valley and Camp Roberts. The nearest kit fox occurrence to the BSA was recorded approximately 0.34 mile south-southwest of the project in 1991, approximately 0.9 miles southeast of the intersection of Union Road and Golden Hill Road.

Suitable habitat for San Joaquin kit fox was observed throughout the BSA. Grassland areas and blue oak woodlands observed within the BSA contained an abundance of prey species (e.g., California ground squirrel, small mammals, ground-nesting birds, and insects) and have the potential to provide foraging habitat or natal or nonnatal den sites for San Joaquin kit fox. This species may also occur in riparian areas throughout the BSA, such as ephemeral drainages, Salinas River, and Huerhuero Creek, while migrating though the area. Orchards and vineyards, similar to those observed in the BSA, have been reported to provide marginal habitat for this species due to their open structure and their underlying layer of herbaceous vegetation to support a prey base (Clark 2001; Warrick et al. 2007). No San Joaquin kit fox dens or sign of San Joaquin kit fox (e.g., tracks) were observed during the 2016 field surveys. However, because of the presence of suitable habitat and documented occurrences, San Joaquin kit fox have potential to occur in the BSA.

Figure 7. CNDDB Records of Sensitive Animals in the Project Vicinity

This page intentionally left blank

4.4.3 Nesting Migratory Passerine Birds and Raptors

Nesting habitat for migratory passerine birds and raptors protected by the MBTA and California Fish and Game Code Section 3500 et seq. is present throughout the BSA, including trees, shrubs, and freshwater emergent wetland vegetation. In addition, several owl boxes were observed throughout the agricultural areas in the BSA. There is high potential for avian species to nest in the BSA during the typical nesting season (February 1–August 31). Nesting is unlikely outside of the typical nesting season, although some avian species may forage year-round near the work zone.

5 DISCUSSION

Based on an in-depth literature review and field surveys, two special-status animals—loggerhead shrike and bald eagle—are present in the BSA. In addition, 19 special-status plant species and 25 additional special-status wildlife species were determined to be either likely to occur, have potential to occur, or unlikely to occur. There is also high potential for avian species to nest in the BSA during the typical nesting season (February 1–August 31). The BSA is located in federally designated vernal pool fairy shrimp critical habitat and suitable habitat for this species was observed within the BSA.

Salinas River, Huerhuero Creek, and 12 other unnamed ephemeral drainages were observed throughout the BSA. These features may be subject to USACE, CDFW, and/or RWQCB jurisdiction. In addition, five wetland features preliminarily mapped in the BSA may also be subject to USACE jurisdiction. Drainage features may also serve as wildlife migration corridors for dispersal of species between local areas and at larger scales between regions.

Flora Compendium

This page intentionally left blank

Table A-1. Flora Compendium

Scientific Name*	Common Name	Native	Species Status
GYMNOSPERMS			
Pinaceae	**Pine family**		
Pinus pinea	Italian stone pine	No	
Taxodiaceae	**Bald cypress family**		
Sequoia sempervirens	coast redwood	Yes	
ANGIOSPERMS (DICOTS)			
Aizoaceae	**Fig-marigold family**		
Carpobrotus chilensis	ice plant	No	
Amaranthaceae	**Amaranth family**		
Amaranthus albus	tumbleweed	No	
Amaranthus retroflexus	green amaranthus	No	
Anacardiaceae	**Sumac family**		
Rhus aromatic	skunkbrush	Yes	
Rhus integrifolia	lemonaid berry	Yes	
Schinus molle	Peruvian pepper tree	No	
Toxicodendron diversilobum	poison oak	Yes	
Apiaceae	**Carrot family**		
Anthriscus caucalis	bur chivel	No	
Bowlesia incana	bowlesia	Yes	
Conium maculatum	poison hemlock	No	
Daucus pusillus	rattle snake weed	Yes	
Eryngium vaseyi	coyote thistle	Yes	
Foeniculum vulgare	sweet fennel	No	
Lomatium californicum	California lomatium	Yes	
Torilis arvensis	field hedge parsley	No	
Apocynaceae	**Dogbane family**		
Vinca major	greater periwinkle	No	
Asclepiadaceae	**Milkweed family**		
Asclepias fascicularis	narrow-leaf milkweed	Yes	
Asclepias vestita	woolly milkweed	Yes	
Asteraceae	**Sunflower family**		
Achillea millefolium	yarrow	Yes	
Achyrachaena mollis	blow-wives	Yes	
Ambrosia acanthicarpa	annual burweed	Yes	

Scientific Name*	Common Name	Native	Species Status
Erigeron bonariensis	flax-leaved horseweed	No	
Erigeron canadensis	horseweed	Yes	
Erigeron foliosus	leafy fleabane	Yes	
Erigeron glaucus	seaside daisy	Yes	
Eriodictyon sp.	yerba santa	Yes	
Eriophyllum confertifolium	golden yarrow	Yes	
Helminthotheca echioides	bristly ox-tongue	No	
Holocarpha heermannii	Heermann's tarweed	Yes	
Hypochaeris glabra	smooth cat's ear	No	
Hypochaeris radicata	rough cat's ear	No	
Lactuca saligna	slender lettuce	No	
Lactuca serriola	prickly lettuce	No	
Logfia gallica	narrow-leafed filago	No	
Micropus californicus var. *californicus*	slender cottonweed	Yes	
Pseudognaphalium stramineum	cottonbatting plant	Yes	
Senecio vulgaris	ragwort	No	
Silybum marianum	milk thistle	No	
Sonchus oleraceus	sow thistle	No	
Stephanomeria virgata	wire-lettuce	Yes	
Taraxacum officinale	dandelion	No	
Xanthium spinosum	spiny cocklebur	Yes	
Xanthium strumarium	cocklebur	Yes	
Uropappus lindleyi	silver puffs	Yes	
Boraginaceae	**Borage family**		
Amsinckia intermedia	common fiddleneck	Yes	
Amsinckia menziesii	small flowered fiddleneck	Yes	
Heliotropium curassavicum	salt heliotrope	Yes	
Plagiobothrys canescens	valley popcorn flower	Yes	
Brassicaceae	**Mustard family**		
Brassica nigra	black mustard	No	
Brassica rapa	field mustard	No	
Capsella bursa-pastoris	shepherd's purse	No	
Hirschfeldia incana	summer mustard	No	
Raphanus sativa	wild radish	No	
Thysanocarpus curvipes	lacepod	Yes	

Scientific Name*	Common Name	Native	Species Status
Caprifoliaceae	**Honeysuckle family**		
Lonicera interrupta	honeysuckle	Yes	
Sambucus nigra	black elderberry	Yes	
Symphoricarpos mollis	creeping snowberry	Yes	
Caryophyllaceae	**Pink family**		
Silene gallica	catchfly	No	
Chenopodiaceae	**Goosefoot family**		
Chenopodium album	pigweed	No	
Chenopodium californicum	California pigweed	Yes	
Salsola tragus	Russian thistle	No	
Cistaceae	**Rock-rose family**		
Cistus monspeliensis	resinous rockrose	No	
Convolvulaceae	**Morning glory family**		
Convolvulus arvensis	bindweed	No	
Cucurbitaceae	**Gourd family**		
Marah fabaceus var. *fabaceus*	wild cucumber	Yes	
Ericaceae	**Heath family**		
Arctostaphylos glauca	big berry manzanita	Yes	
Euphorbiaceae	**Spurge family**		
Croton setiger	doveweed/turkey mullein	Yes	
Euphorbia ocellata ssp. *ocellata*	valley spurge	Yes	
Fabaceae	**Pea family**		
Acmispon americanus	Spanish lotus	Yes	
Acmispon glaber	deer weed	Yes	
Astragalus douglasii var. *douglasii*	Douglas's milkvetch	Yes	
Lathyrus odoratus	sweet pea	No	
Lupinus albifrons	silver lupine	Yes	
Lupinus bicolor	miniature lupine	Yes	
Lupinus hirsutissimus	stinging lupine	Yes	
Lupinus microcarpus var. *microcarpus*	chick lupine	Yes	
Lupinus nanus	sky lupine	Yes	
Melilotus indica	sourclover	No	
Medicago polymorpha	bur clover	No	
Trifolium hirtum	rose clover	No	
Vicia sativa	spring vetch	No	

Scientific Name*	Common Name	Native	Species Status
Vicia villosa	hairy vetch	No	
Fagaceae	**Oak family**		
Quercus agrifolia	coast live oak	Yes	
Quercus berberidifolia	scrub oak	Yes	
Quercus douglasii	blue oak	Yes	
Quercus lobata	valley oak	Yes	
Geraniaceae	**Geranium family**		
Erodium cicutarium	red-stemmed filaree	No	
Erodium botrys	filaree	No	
Geranium dissectum	cut leaf geranium	No	
Hydrophylaceae	**Waterleaf family**		
Phacelia distans	common phacelia	Yes	
Phacelia malviflora	stinging phacelia	Yes	
Pholistoma auritum	fiesta flower	Yes	
Juglandaceae	**Walnut family**		
Juglans californica var *californica*	S. California black walnut	Yes	
Lamiaceae	**Mint family**		
Lavandula sp.	lavender	No	
Marrubium vulgare	horehound	No	
Stachys bullata	hedge nettle	Yes	
Lauraceae	**Laurel family**		
Umbellaria californica	California bay	Yes	
Malvaceae	**Mallow family**		
Malva parviflora	cheeseweed	No	
Montiaceae	**Minor's lettuce family**		
Claytonia perfoliata	miners lettuce	Yes	
Myrsinaceae	**Myrsine family**		
Lysimachia arvensis	scarlet pimpernel	No	
Myrtaceae	**Myrtle family**		
Eucalyptus globules	blue gum	No	
Oleaceae	**Ash family**		
Olea europaea	olive	No	
Onagraceae	**Evening primrose family**		
Clarkia affinis	chaparral fairyfan	Yes	
Clarkia bottae	punch bowl clarkia	Yes	

Scientific Name*	Common Name	Native	Species Status
Clarkia purpurea ssp quadrivulnera	purple clarkia	Yes	
Clarkia speciosa	red spotted clarkia	Yes	
Clarkia unguiculata	elegant clarkia	Yes	
Epilobium canum	California fuchsia	Yes	
Eremothera boothii ssp. *decorticans*	shredding evening primrosa	Yes	
Oxalidaceae	**Woodsorrel family**		
Oxalis pes-caprae	Bermuda buttercup	No	
Papaveraceae	**Poppy family**		
Eschscholzia californica	California poppy	Yes	
Plantaginaceae	**Plantain family**		
Collinsia heterophylla	Chinese houses	Yes	
Plantago lanceolata	English plantain	No	
Plantanaceae	**Sycamore family**		
Platanus racemosa	western sycamore	Yes	
Polemoniaceae	**Phlox family**		
Navarretia atractyloides	holly leaf navarretia	Yes	
Polygonaceae	**Buckwheat family**		
Chorizanthe membranacea	pink spineflower	Yes	
Eriogonum elegans	elegant buckwheat	Yes	Rank 4.3
Eriogonum gracillimum	slender-stemmed buckwheat	Yes	
Eriogonum nudum	naked buckwheat	Yes	
Eriogonum roseum	wand buckwheat	Yes	
Polygonum aviculare	prostrate knotweed	No	
Rumex acetosella	sheep sorrel	No	
Rumex crispus	curly dock	No	
Rumex pulcher	fiddle dock	No	
Ranunculaceae	**Buttercup family**		
Delphinium parryi ssp. *parryi*	San Berbardino larkspur	Yes	
Rhamnaceae	**Buckthorn family**		
Ceanothus cuneatus var. *cuneatus*	wedgeleaf ceanothus	Yes	
Frangula californica	coffeeberry	Yes	
Rhamnus ilicifolia	evergreen buckthorn	Yes	
Rosaceae	**Rose family**		
Heteromeles arbutifolia	toyon	Yes	

Scientific Name*	Common Name	Native	Species Status
Rosa californica	California wild rose	Yes	
Rubiaceae	**Madder family**		
Galium aparine	goose grass	Yes	
Salicaceae	**Willow family**		
Populus fremontii ssp. *fremontii*	Fremont's cottonwood	Yes	
Salix exigua	sandbar willow	Yes	
Salix lasiandra	red willow	Yes	
Salix lasiolepis	arroyo willow	Yes	
Salix laevigata	red willow	Yes	
Scrophulariaceae	**Figwort family**		
Verbascum thapsus	common mullein	No	
Solanaceae	**Nightshade family**		
Datura stramonium	jimson weed	No	
Nicotiana acuminate	manyflowered tobacco	No	
Solanum americanum	American black nightshade	Yes	
Urticaceae	**Nettle family**		
Urtica dioica	hoary nettle	Yes	
Urtica urens	dwarf nettle	No	
Verbenaceae	**Verbena family**		
Verbena lasiostachys	common vervain	No	
Violoaceae	**Violet family**		
Viola pedunculata	Johnny jump-up	Yes	
Viscaceae	**Mistletoe family**		
Phoradendron villosum	oak mistletoe	Yes	
Vitaceae	**Grape family**		
Vitis sp.	cultivated grape	Unknown	
ANGIOSPERMS (MONOCOTS)			
Araceae	**Arum family**		
Lemna sp.	duckweed		
Cyperaceae	**Sedge family**		
Cyperus eragrostis	tall flat sedge	Yes	
Eleocharis macrostachya	common spikerush	Yes	
Eleocharis parishii	spikerush	Yes	
Schoenoplectus americanus	bulrush	Yes	

Scientific Name*	Common Name	Native	Species Status
Liliaceae	**Lily family**		
Bloomeria crocea	common goldenstar	Yes	
Brodiaea terrestris	dwarf brodiaea	Yes	
Calochortus luteus	yellow mariposa lily	Yes	
Dichelostemma capitatum	blue dicks	Yes	
Poaceae	**Grass family**		
Avena barbata	slender wild oats	No	
Avena fatua	wild oats	No	
Briza maxima	rattle snake grass	No	
Bromus arenarius	Australian chess	No	
Bromus carinatus	California brome	Yes	
Bromus diandrus	ripgut brome	No	
Bromus hordeaceus	soft chess brome	No	
Bromus madritensis	Spanish brome	No	
Bromus rubens	red brome	No	
Deinandra fasciculata	clustered tarweed	Yes	
Distichlis spicata	saltgrass	Yes	
Festuca bromoides	brome fescue	No	
Festuca microstachys	small fescue	Yes	
Festuca myuros	rattail fescue	No	
Festuca perennis	Italian ryegrass	No	
Hordeum brachyantherum	meadow barley	Yes	
Hordeum murinum ssp. leporinum	foxtail	No	
Hordeum marinum ssp. gussoneanum	Mediterranean barley	No	
Melica imperfecta	melic grass	Yes	
Stipa pulchra	purple needle-grass	Yes	
Stipa cernua	nodding needle grass	Yes	
Typhaceae	**Cattail family**		
Typha latifolia	cattail	Yes	

*Vascular Plants nomenclature follows " The Jepson Manual" and http://ucjeps.berkeley.edu/interchange.html.

Fauna Compendium

This page intentionally left blank

Table B-1. Fauna Compendium

Common Name	Scientific Name
BIRDS	
Anatidae	
mallard	*Anas platyrhynchos*
Odontophoridae	
California quail	*Callipepla californica*
Cathartidae	
turkey vulture	*Cathartes aura*
Accipitridae	
red-tailed hawk	*Buteo jamaicensis*
Rallidae	
sora	*Porzana carolina*
Charadriidae	
killdeer	*Charadrius vociferus*
Columbidae	
mourning dove	*Zenaida macroura*
Eurasian collared dove*	*Streptopelia decaocto*
Apodidae	
white-throated swift	*Aeronautes saxatalis*
Picidae	
acorn woodpecker	*Melanerpes formicivorus*
downy woodpecker	*Picoides pubescens*
hairy woodpecker	*Picoides villosus*
northern flicker	*Colaptes auratus*
Tyrannidae	
western kingbird	*Tyrannus verticalis*
western wood-pewee	*Contopus sordidulus*
ash-throated flycatcher	*Myiarchus cinerascens*
Paridae	
oak titmouse	*Baeolophus inornatus*
Laniidae	
loggerhead shrike	*Lanius ludovicianus*

Common Name	Scientific Name
Corvidae	
western scrub-jay	*Aphelocoma californica*
American crow	*Corvus brachyrhynchos*
Hirundinidae	
barn swallow	*Hirundo rustica*
cliff swallow	*Petrochelidon pyrrhonota*
tree swallow	*Tachycineta bicolor*
Sittidae	
white-breasted nuthatch	*Sitta carolinensis*
Turdidae	
western bluebird	*Sialia mexicana*
Mimidae	
northern mockingbird	*Mimus polyglottos*
California thrasher	*Toxostoma redivivum*
Sturnidae	
European starling*	*Sturnus vulgaris*
Emberizidae	
spotted towhee	*Pipilo maculatus*
California towhee	*Melozone crissalis*
savannah sparrow	*Passerculus sandwichensis*
white-crowned sparrow	*Zonotrichia leucophrys*
song sparrow	*Melospiza melodia*
Icteridae	
red-winged blackbird	*Agelaius phoeniceus*
Brewer's blackbird	*Euphagus cyanocephalus*
western meadowlark	*Sturnella neglecta*
Fringillidae	
house finch	*Haemorhous mexicanus*
lesser goldfinch	*Spinus psaltria*
Passeridae	
house sparrow*	*Passer domesticus*

Common Name	Scientific Name
MAMMALS	
Canidae	
coyote	*Canis latrans*
Felidae	
bobcat	*Lynx rufus*
domestic cat*	*Felis catus*
Cervidae	
mule deer	*Odocoileus hemionus*
Sciuridae	
California ground squirrel	*Otospermophilus beecheyi*
Leporidae	
brush rabbit	*Sylvilagus bachmani*
Procyonidae	
raccoon	*Procyon lotor*
Didelphidae	
Virginia opossum	*Didelphis virginiana*
AMPHIBIANS	
Hulidae	
northern pacific treefrog	*Pseudacris regilla*
Ranidae	
American bullfrog*	*Lithobates catesbeianus*
REPTILES	
Phrynosomatidae	
western fence lizard	*Sceloporus occidentalis*
INSECTS	
Acrididae	
short-horned grasshopper	*Unknown*
Papilionidae	
western tiger swallowtail	*Papilio rutulus*
FISH	
Cyprinidae	
koi*	*Cyprinus carpio*

Common Name	Scientific Name
Centrarchidae	
bluegill*	*Lepomis macrochirus*
largemouth bass*	*Micropterus salmoides*

*Introduced species
**Special-status species

Appendix C.
Photo Documentation

This page intentionally left blank

Photo 1: View northeast showing blue oak woodland habitat typical of what was observed throughout the BSA.

Photo 2: View facing south showing a seasonal wetland with coyote mint (*Monardella villosa*), a vernal pool indicator species, that was preliminarily mapped approximately 200 feet east of Buena Vista Drive.

Photo 3: View facing north showing vernal pools that were preliminarily mapped in April 2016 along Golden Hill Road (red arrow). The pools contained vernal pool indicator species such as *Eryngium vaseyi*.

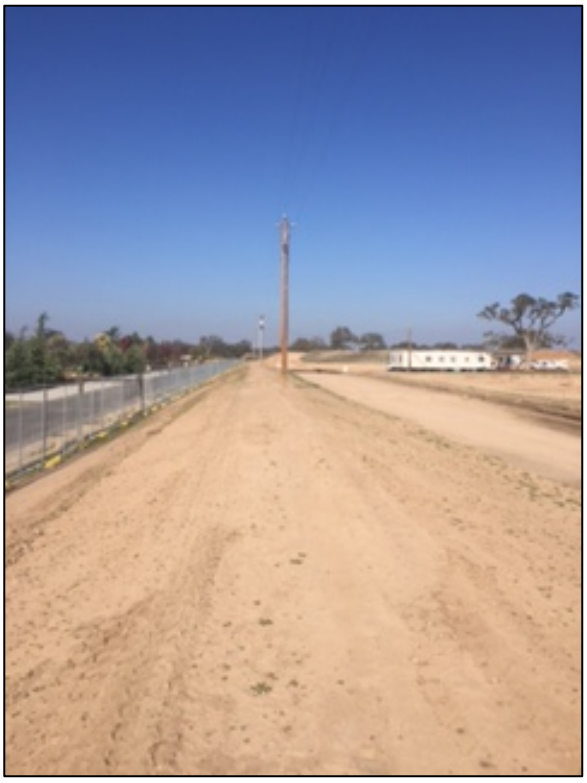

Photo 4: View facing north showing the same area as shown in Photo 3 in November 2016. Note that the preliminarily mapped wetland features have been directly eliminated during construction of a new RV park. The pools were graded over and an approximate 4-foot-high earthen berm was placed over the pools.

Photo 5: View facing northwest showing the portion of Huerhuero Creek observed in the BSA.

Photo 6: View facing west showing Central Coast cottonwood-willow riparian habitat along Salinas River. This portion of the BSA may provide suitable foraging and nesting habitat for least Bell's vireo.

Photo 7: View facing southeast at an ephemeral drainage channel observed in the BSA. A seasonal wetland was observed in a low point in the drainage channel (red arrow) which may provide suitable habitat for vernal pool fairy shrimp.

Photo 8: View facing northeast down Union Road showing urban/developed landscape similar to what was observed throughout the BSA.

Photo 9: View facing northeast at agricultural habitat typical of that observed throughout the BSA.

Photo 10: Photo showing a small mammal burrow typical of those observed throughout the BSA.

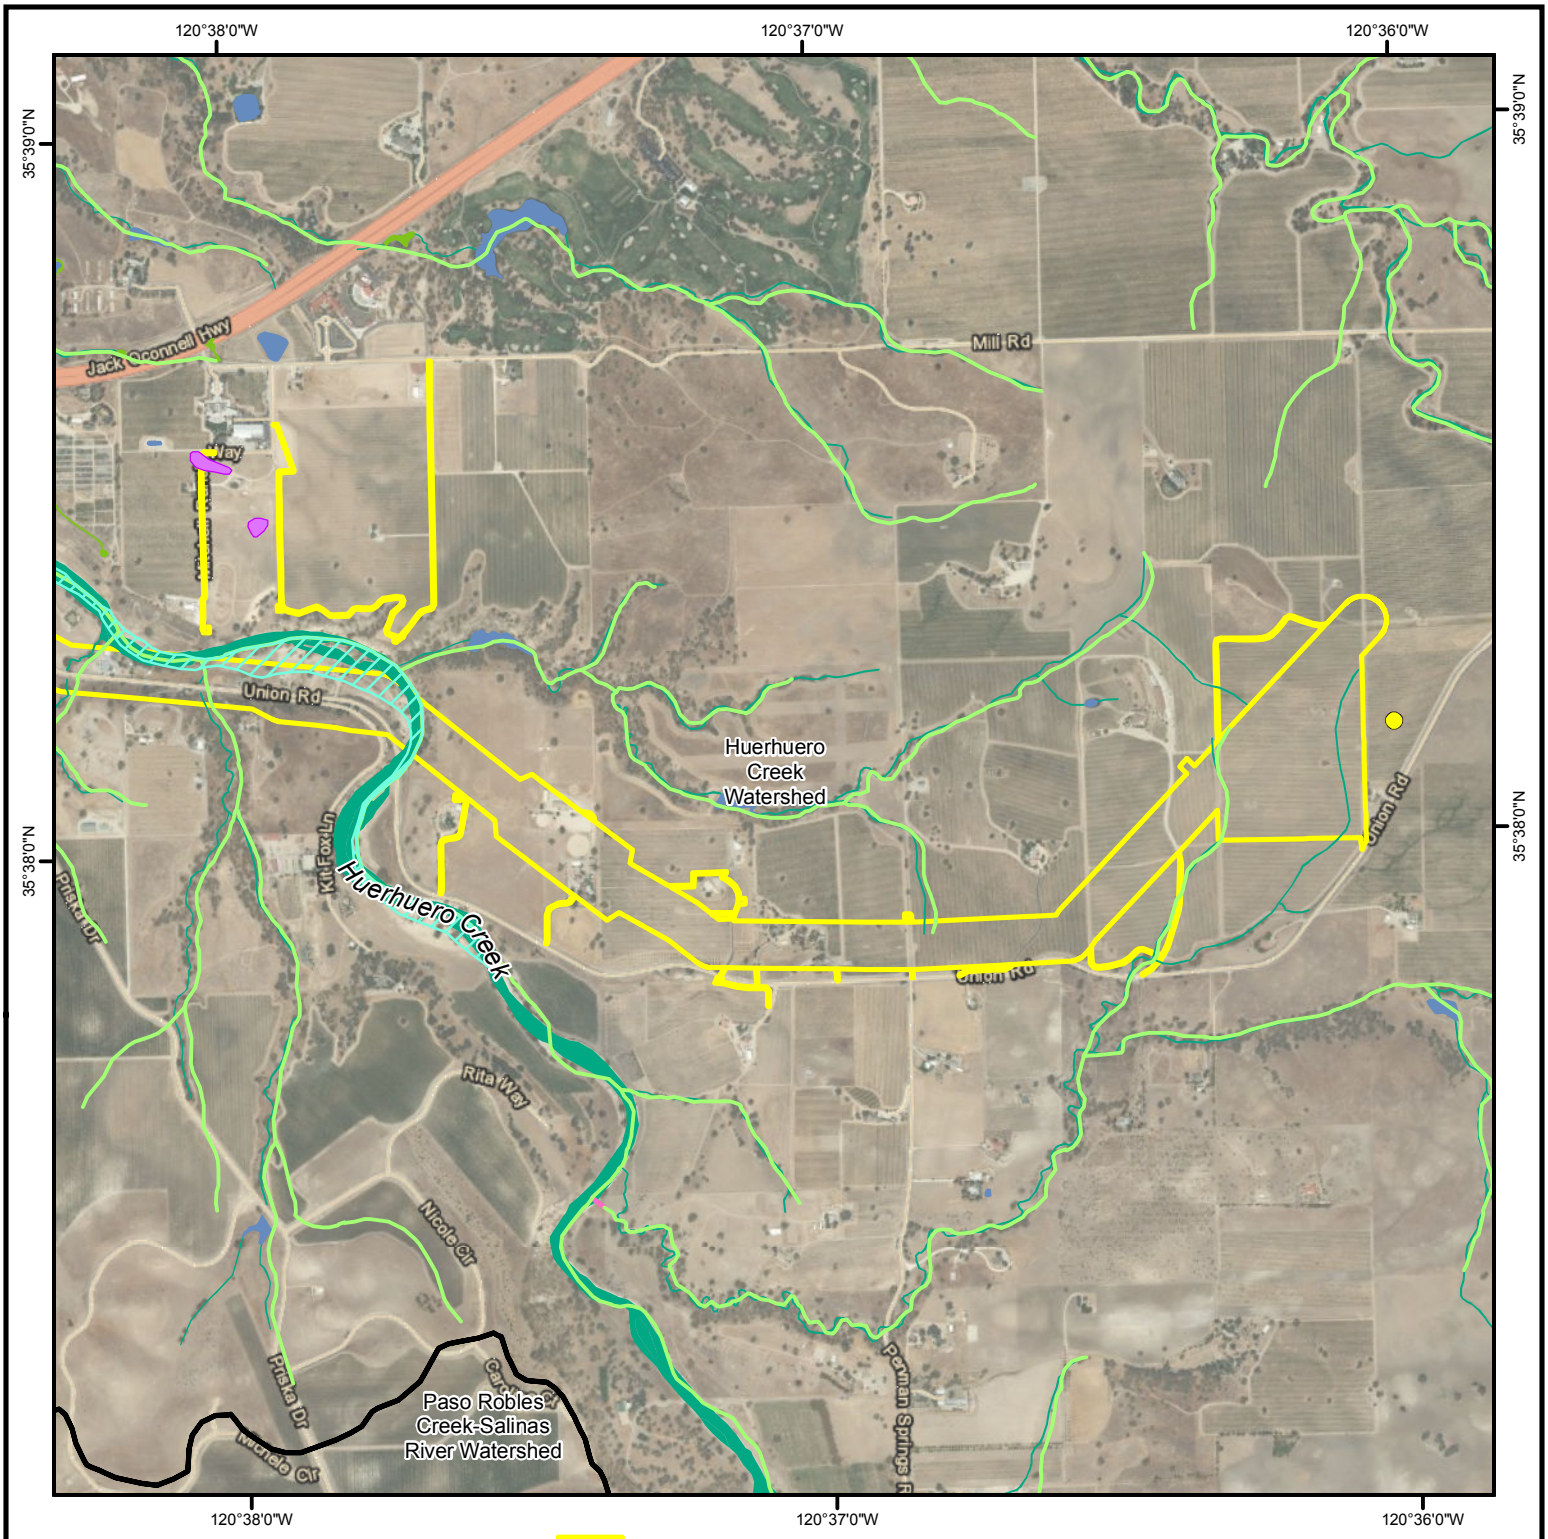

Photo 11: Photo showing suitable aquatic breeding and/or non-breeding habitat for California red-legged frog. This location, S6, is one of 10 aquatic habitats that were assessed for its potential to support California red-legged frog during the site assessment. This drainage feature is fed by overflow from upstream ponds at Hunter Ranch Golf Course and therefore is subject to human influence (e.g., water flow/discharge control and pesticides).

Date of Site Assessment: 11/14/2016
(mm/dd/yyyy)

Site Assessment Biologists: Outten, Kristen (Last name) (first name); Castanon, Chennie (Last name) (first name)

_____ (Last name) _____ (first name); _____ (Last name) _____ (first name)

Site Location: San Luis Obispo County; Site 1a; 35.639295°, -120.590566°
(County, General location name, UTM Coordinates or Lat./Long. or T-R-S).

****ATTACH A MAP** (include habitat types, important features, and species locations)**

Proposed project name: Estella Substation and Paso Robles Area Reinforcement Project
Brief description of proposed action:

PG&E proposes to construct approximately 7 miles of a new double-circuit power line in northern San Luis Obispo County extending from Estrella Substation to the existing San Miguel-Paso Robles 70 kV power line. At this interconnection point, the new Estrella-Paso Robles 70 kV power line will be connected to the portion of the existing San Miguel-Paso Robles 70 kV power line that extends south to Paso Robles Substation. This approximately 3-mile portion of existing 70 kV power line between the interconnection point and Paso Robles Substation will be reconductored as part of the project.

1) Is this site within the current or historic range of the CRF (circle one)? (YES) NO

2) Are there known records of CRF within 1.6 km (1 mi) of the site (circle one)? YES (NO)
If yes, attach a list of all known CRF records with a map showing all locations.

GENERAL AQUATIC HABITAT CHARACTERIZATION

(if multiple ponds or streams are within the proposed action area, fill out one data sheet for each)

POND:

Size: 0.8 acre Maximum depth: 13 feet (when full)

Vegetation: emergent, overhanging, dominant species: Emergent vegetation (i.e. scirpus, juncus, algae) along banks and in center of pond. No canopy cover.

Substrate: Silty substrate, algae throughout.

(**Perennial**) **or Ephemeral** *(circle one)*. If ephemeral, date it goes dry: _____

22

Appendix D.
California Red-legged Frog Habitat Site Assessment Data Sheet

STREAM:

Bank full width: _____
Depth at bank full: _____
Stream gradient: _____

Are there pools (circle one)? YES NO
If yes,
Size of stream pools: _____
Maximum depth of stream pools: _____

Characterize non-pool habitat: run, riffle, glide, other: _____
_____
_____

Vegetation: emergent, overhanging, dominant species: _____
_____
_____

Substrate: _____
_____

Bank description: _____
_____
_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Surrounding land use consists of intensive viticulture and a rural residential development. The agricultural retention pond is located 30 feet northwest of Dry Creek. The pond is separated from Dry Creek by an elevated (5-10' high) earthen berm with a low density of ruderal vegetation and small mammal burrows (1-3" diameter) occurring along the berm. Emergent vegetation (<5% total cover) occurs within and along the banks of the pond. Emergent vegetation primarily consists of scirpus, juncus, and algae. The water is cool and murky (visibility <3'). Introduced fish, including large mouth bass and blue gill are abundant in the pond. According to the on-site resident, the pond was stocked with fish over 30 years ago. Waterfowl (i.e. American coot) and passerines (i.e black phoebe, white-crowned sparrow) were observed foraging and flying around the pond. No sign of amphibians were observed during the survey. The current and historical land use (i.e. viticulture) and presence of predators (30+ years of predatory fish) make this habitat marginal for breeding CRLF.

Necessary Attachments:

1. All field notes and other supporting documents
2. Site photographs
3. Maps with important habitat features and species location

_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Surrounding land use consists of intensive viticulture. The agricultural retention pond is located 550 feet north of Dry Creek. The berm surrounding the pond contains a moderate density of ruderal vegetation and a low density of small mammal burrows (1-3" diameter). The banks around the pond are steep (40-60% slope). Emergent vegetation (5-10% total cover) occurs within and along the banks of the pond. Emergent vegetation primarily consists of scirpus, a submerged forb (species unknown), and algae. The water is cool and clear (visibility >6'). Introduced fish, including large mouth bass and blue gill are abundant in the pond. According to the on-site resident, the pond was stocked with fish over 30 years ago. Waterfowl (i.e. American coot) and passerines (i.e black phoebe) were observed foraging and flying around the pond. Deer tracks were present around the banks. No sign of amphibians were observed during the survey. The current and historical land use (i.e. viticulture) and presence of predators (30+ years of predatory fish) make this habitat marginal for breeding CRLF.

GENERAL AQUATIC HABITAT CHARACTERIZATION

(if multiple ponds or streams are within the proposed action area, fill out one data sheet for each)

POND:
Size: _____ Maximum depth: _____

Vegetation: emergent, overhanging, dominant species: _____

Substrate:_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Appendix D.
California Red-legged Frog Habitat Site Assessment Data Sheet

STREAM:

Bank full width: 65 feet
Depth at bank full: 12 inches
Stream gradient: <5%

Are there pools (circle one)? YES (NO)
If yes,
Size of stream pools: _____
Maximum depth of stream pools: _____

Characterize non-pool habitat: run, riffle, glide, other: None (at time of site visit)

Vegetation: emergent, overhanging, dominant species: Stream channel contains little to no vegetation. A very low density of forbs was observed scattered throughout the channel, and sparse, intermittent patches of willow.
Substrate: Coarse sand

Bank description: Densely vegetated with grasses and forbs. Slopes range from 10 -30% .

Perennial or (Ephemeral) *(circle one)*. If ephemeral, date it goes dry: Unknown

Other aquatic habitat characteristics, species observations, drawings, or comments:

Huerhuero is a ephemeral creek that generally flows northwest and drains into the Salinas River in Paso Robles. The meandering channel has a deep sandy substrate with little to no vegetation growing in the channel. Based on field observations and several years of aerial imagery (Google Earth), Huerhuero Creek appears to flow following significant rain events. The remainder of the year, the drainage channel appears to be dry. No suitable aquatic CRLF breeding habitat is present in the drainage channel. The drainage feature may provide temporary aquatic nonbreeding habitat or migratory habitat for CRLF following significant rain events. Adjacent blue oak woodlands may provide suitable upland habitat for CRLF. No sign of CRLF or other amphibians were observed during the site visit.

Necessary Attachments:

1. All field notes and other supporting documents
2. Site photographs
3. Maps with important habitat features and species location

Vegetation: emergent, overhanging, dominant species: _____
_____
_____

Substrate: _____
_____

Bank description: _____
_____
_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Manmade retention basin used for recreational and agricultural purposes. Surrounding land use includes a single residence, a small vineyard, and adjacent blue oak woodlands with a steep ephemeral drainage. The banks of the pond range from a 30-80% slope and are densely vegetated. A low density of small mammal burrows were observed along the banks and adjacent upland areas. The water in the pond is cold and clear (>7' visibility). An abundance of fish (i.e. large mouth bass and coi fish), water fowl (i.e. American coot), a turtle (species unknown), passerines and raptors were observed in and around the pond. A northern pacific treefrog was heard calling from the north side of the pond. Human activity, land use practices, and predators may provide a threat to breeding or migrating CRLF; however, suitable aquatic breeding and non-breeding habitat, as well as adjacent upland habitat is present at this location.

PG&E proposes to construct approximately 7 miles of a new double-circuit power line in northern San Luis Obispo County extending from Estrella Substation to the existing San Miguel-Paso Robles 70 kV power line. At this interconnection point, the new Estrella-Paso Robles 70 kV power line will be connected to the portion of the existing San Miguel-Paso Robles 70 kV power line that extends south to Paso Robles Substation. This approximately 3-mile portion of existing 70 kV power line between the interconnection point and Paso Robles Substation will be reconductored as part of the project.

1) Is this site within the current or historic range of the CRF (circle one)? (YES) NO

2) Are there known records of CRF within 1.6 km (1 mi) of the site (circle one)? YES (NO)
If yes, attach a list of all known CRF records with a map showing all locations.

GENERAL AQUATIC HABITAT CHARACTERIZATION

(if multiple ponds or streams are within the proposed action area, fill out one data sheet for each)

POND:
Size: _____ Maximum depth: _____

Vegetation: emergent, overhanging, dominant species: _____

Substrate:_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

22

Appendix D.
California Red-legged Frog Habitat Site Assessment Data Sheet

STREAM:

Bank full width: 2-4 feet
Depth at bank full: 12-18 inches
Stream gradient: <5%

Are there pools (circle one)? YES (NO)
If yes,
Size of stream pools: _____
Maximum depth of stream pools: _____

Characterize non-pool habitat: run, riffle, glide, other: Slow flow to standing water

Vegetation: emergent, overhanging, dominant species: Stream channel and banks dense with debris and emergent vegetation: *Juncus* sp., *Eleochris* sp., *Rumex crispis, Salix* sp., *Typha latifolia*, and *Lemna minor*. Canopy cover includes blue oak woodlands.

Substrate: Silty with fine gravel. Thick (~8") layer of algae.

Bank description: Densely vegetated with defined banks (45-90° slopes)

Perennial or (Ephemeral *(circle one)*. If ephemeral, date it goes dry: Unknown

Other aquatic habitat characteristics, species observations, drawings, or comments:

The drainage channel is downstream of Hunter Ranch Golf Course, which is likely contributing to the presence of water in the drainage channel (e.g. draining ponds). Under natural conditions, the drainage feature is presumed to be ephemeral; however, the presence of cattail and other wetland indicator species suggest the ephemeral drainage serves more as a perennial drainage due to human influences. The drainage channel is surrounded by dense blue oak woodlands with a grassy understory. A moderate abundance of small mammal burrows (1-5" diameter) present around the drainage. One northern pacific tree frog was heard calling nearby. No other sign of amphibians was seen or heard. Depending on drainage conditions and human influence (i.e. water input from golf course upstream), the drainage feature may provide suitable breeding and non-breeding habitat for CRLF. Blue oak woodlands surrounding the drainage may provide suitable upland habitat for CRLF. The drainage channel is contiguous with aquatic feature S5.

Substrate: _____
_____

Bank description: _____
_____
_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Manmade retention pond in Barney Schwartz Park, a recreational park owned by City of Paso Robles. Water is cold and murky (visibility <2 feet) and is continuously circulating/filtrating through a system of pumps. The pond is lined with an artificial rocky substrate with emergent rocks scattered throughout the pond. An abundance of red-eared slider turtles were observed basking on the rocks. Wildlife observed during the survey includes waterfowl, passerines, raptors, and turtles. A low to moderate abundance of human activity and garbage may increase the abundance of predators such as raccoons and skunks. No sign of amphibians were observed during the survey. Manicured lawns and landscaped vegetation surround the pond. The pond and banks of the pond are devoid of vegetation, precluding this site from serving as CRLF breeding habitat. Grazed nonnative grasslands and blue oak woodlands with an ephemeral drainage channel is located approximately 60 feet south of the pond and may serve as suitable upland habitat. No suitable breeding habitat was observed within 1-mile of the pond.

Necessary Attachments:

1. All field notes and other supporting documents

_____

Bank description: _____
_____
_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Surrounding land use includes intensive agriculture production. An ephemeral drainage channel is located approximately 50 feet east of the pond. The agricultural retention pond contains little to no emergent vegetation. There is evidence of cattail along the banks of the pond; however, this vegetation has died off due to a receding water line. Water visibility is poor (<2'), the presence of fish is unknown. No sign of frogs or other amphibians were observed during the survey. There is no suitable breeding habitat; however, the pond and adjacent drainage channel may provide suitable aquatic or upland habitat while traveling to/from breeding sites.

Bank description: _____
_____
_____

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

The pond is located within an ephemeral drainage channel. It has been dammed by an earthen berm at the west end of the pond, and is fed by a warm sulfur spring. A culvert crosses beneath the earthen berm and drains the pond into the Salinas River, approximately 600 feet to the west. The water is warm and murky; visibility is less than 1-foot. A dense stand of cattail surrounds the perimeter of the pond, and is dense in the drainage channel downstream of the pond. An abundance of American bull frogs were observed surrounding the perimeter of the pond. Northern pacific trees frogs were also heard calling from a distance. Cray fish, large mouth bass, and several small (2-3") jumping fish were observed in the pond. Several avian species, including green heron, belted kingfisher, red-wing blackbird, hooded merganser, and red-tailed hawk were observed within and around the pond. Several domestic cats were observed within 300 feet of the pond. The pond may serve as aquatic breeding and/ or non-breeding habitat for CRLF. Surrounding blue oak woodlands may provide suitable upland habitat for this species. Warmer water temperatures and the abundance of predators (i.e. bullfrogs, fish) may degrade the quality of breeding habitat for CRLF.

GENERAL AQUATIC HABITAT CHARACTERIZATION

(if multiple ponds or streams are within the proposed action area, fill out one data sheet for each)

POND:

Size: 1 acre Maximum depth: 4-5 feet

Vegetation: emergent, overhanging, dominant species: Emergent *Typha latifolia* (~15-20% total cover) within the retention basin. Ruderal vegetation growing along the banks.

Substrate: Silty with rock fill mixed throughout

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

22

Appendix D.
California Red-legged Frog Habitat Site Assessment Data Sheet

STREAM:

Bank full width: 25'
Depth at bank full: 24"
Stream gradient: 1-5%

Are there pools (circle one)? (YES) NO
If yes,
Size of stream pools: varies, 25-50 square feet
Maximum depth of stream pools: <24"

Characterize non-pool habitat: run, riffle, glide, other: Glide to riffle. Manmade meandering stream designed to drain the warm spring into the Salinas River.

Vegetation: emergent, overhanging, dominant species: Willows are the dominant species along the banks, along with dense stands of mugwort, mulefat, cattail, and forbs along the banks and in the stream channel.
Substrate: Sandy to coarse gravel.

Bank description: Densely vegetated banks ranging from 30-60% slope

Perennial or Ephemeral *(circle one)*. If ephemeral, date it goes dry: _____

Other aquatic habitat characteristics, species observations, drawings, or comments:

Ground water basin at Paso Robles Waste Water Treatment Facility. Dense stands of cattail and algae occur throughout the pond. Beavers are present, as are cray fish and waterfowl. No sign of amphibians were observed during the survey. On-site personnel did not recall ever hearing or seeing frogs in or near the ponds. The water in the groundwater basin is murky (visibility <2') and dense with algae. Surrounding land use includes the waste water treatment facility. Salinas River riparian corridor parallels the eastern side of the basin, separated by an elevated gravel road/berm. A manmade riverine system is located on the north end of the basin. It was created to drain the warm spring (used to heat the waste water treatment facility) into the Salinas River. The drainage contains emergent vegetation (i.e. cattail, willow, forbs) with side pools/eddys.

Archaeological and other heritage resources can be damaged or destroyed through uncontrolled public disclosure of information regarding their location.

Information regarding the location, character, or ownership of a cultural resource is exempt from the Freedom of Information Act pursuant to 16 United States Code (U.S.C.) 470w-3 (National Historic Preservation Act) and 16 U.S.C. Section 470(h) (Archaeological Resources Protections Act).

EXECUTIVE SUMMARY

A Cultural Resources Technical Report (CRTR) has been prepared for the Estrella Substation component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by Pacific Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC (NEET West). NEET West proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by PG&E that together comprise Estrella Substation, in north-central San Luis Obispo County.

This CRTR was prepared to identify, describe, and evaluate cultural resources in the vicinity of Estrella Substation. This study was completed in compliance with and in satisfaction of the California Environmental Quality Act (CEQA). California Public Resources Code (PRC) Section 5024.1, California Code of Regulations Title 14, Section 15064.5 of the CEQA Guidelines, and PRC Sections 21083.2 and 21084.1 were also used as the basic guidelines for the cultural resources study (Governor's Office of Planning and Research 1998).

On September 8, 2015, cultural resources specialists requested a search of the California Historical Resources Information System from the Central Coast Information Center (CCIC), located at the University of California, Santa Barbara. The CCIC provided the results on September 10, 2015, and provided copies of relevant study reports on April 12, 2016. On April 5, 2016, project proponents requested a search of the Sacred Lands Files from the Native American Heritage Commission (NAHC). Project proponents received a response letter by email from NAHC on April 6, 2016. Project proponents sent letters via mail and email to the two Native American representatives identified by the NAHC who may have knowledge of cultural resources in the vicinity of the project area on June 27, 2016. Archaeologists conducted pedestrian archaeological surveys on March 3, March 8, and May 16, 2016, and an architectural historian conducted the built environment field survey of the study area field staff photo-documented potential historical architectural resources within the Steinbeck Vineyards and Winery on March 25, 2016. An architectural historian conducted a follow-up built environment survey on May 16, 2016.

Results of the CCIC records search indicate that 12 previous cultural resource studies have been conducted within approximately 1 mile of Estrella Substation. No previous studies have been conducted within the Study Area. The CCIC records search results did not identify any cultural resources within the study area, and two prehistoric isolates are within 1 mile of Estrella Substation. The buried site sensitivity analysis concluded that most of the archaeological survey area has low potential to contain buried archaeological sites, with the exception of the northeastern corner, which has moderate sensitivity. The archaeological pedestrian survey identified no cultural resources within the survey area.

The built environment study identified and evaluated five resources within the survey area. Two of the recorded resources (existing 500 kV and 230 kV transmission lines) intersect Estrella Substation project components; the other three resources recorded (Steinbeck Vineyards and Winery, Falcon Nest Vineyard and Winery, and 5715 Union Road) are outside Estrella Substation but within the built environment survey area. All five built environment resources are considered ineligible for listing in the National Register of Historic Places and the California Register of Historical Resources.

1 INTRODUCTION

NextEra Energy Transmission West, LLC (NEET West) proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by Pacific Gas and Electric Company (PG&E) that together comprise Estrella Substation, in northern San Luis Obispo County, California (Figures 1–3). NEET West is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by NEET West and PG&E.

This Cultural Resources Technical Report (CRTR) was prepared to document the existing cultural resources in the vicinity of Estrella Substation. This report describes the methodologies used to document the cultural resources identified and presents the results of those investigations. A similar report has been prepared for the power line component of the project, and the results of that effort are presented under separate cover.

This report refers to several different areas associated with the substation, as defined below and shown on Figures 2–3:

- **Estrella Substation Area:** An approximately 15-acre area (project substation site) comprising the temporary and permanent disturbance footprint. The area is an irregularly-shaped area bounded by Union Road to the south; PG&E's easement for existing transmission lines to the north; an unnamed, unpaved road on the western edge of the parcel; and vineyards under cultivation by private landowners to the east and west. The site is currently under vineyard cultivation with 10-foot-wide row spacing and several dirt maintenance roads running through the parcel.

- **Study Area:** Area comprising the Archaeological Survey Area (ASA) and Built Environment Survey Area (BESA).

    - **Archaeological Survey Area:** Area subject to pedestrian survey for archaeological resources.

    - **Built Environment Survey Area:** Area for which impacts on historical resources were considered.

Figure 1. Project Vicinity Map

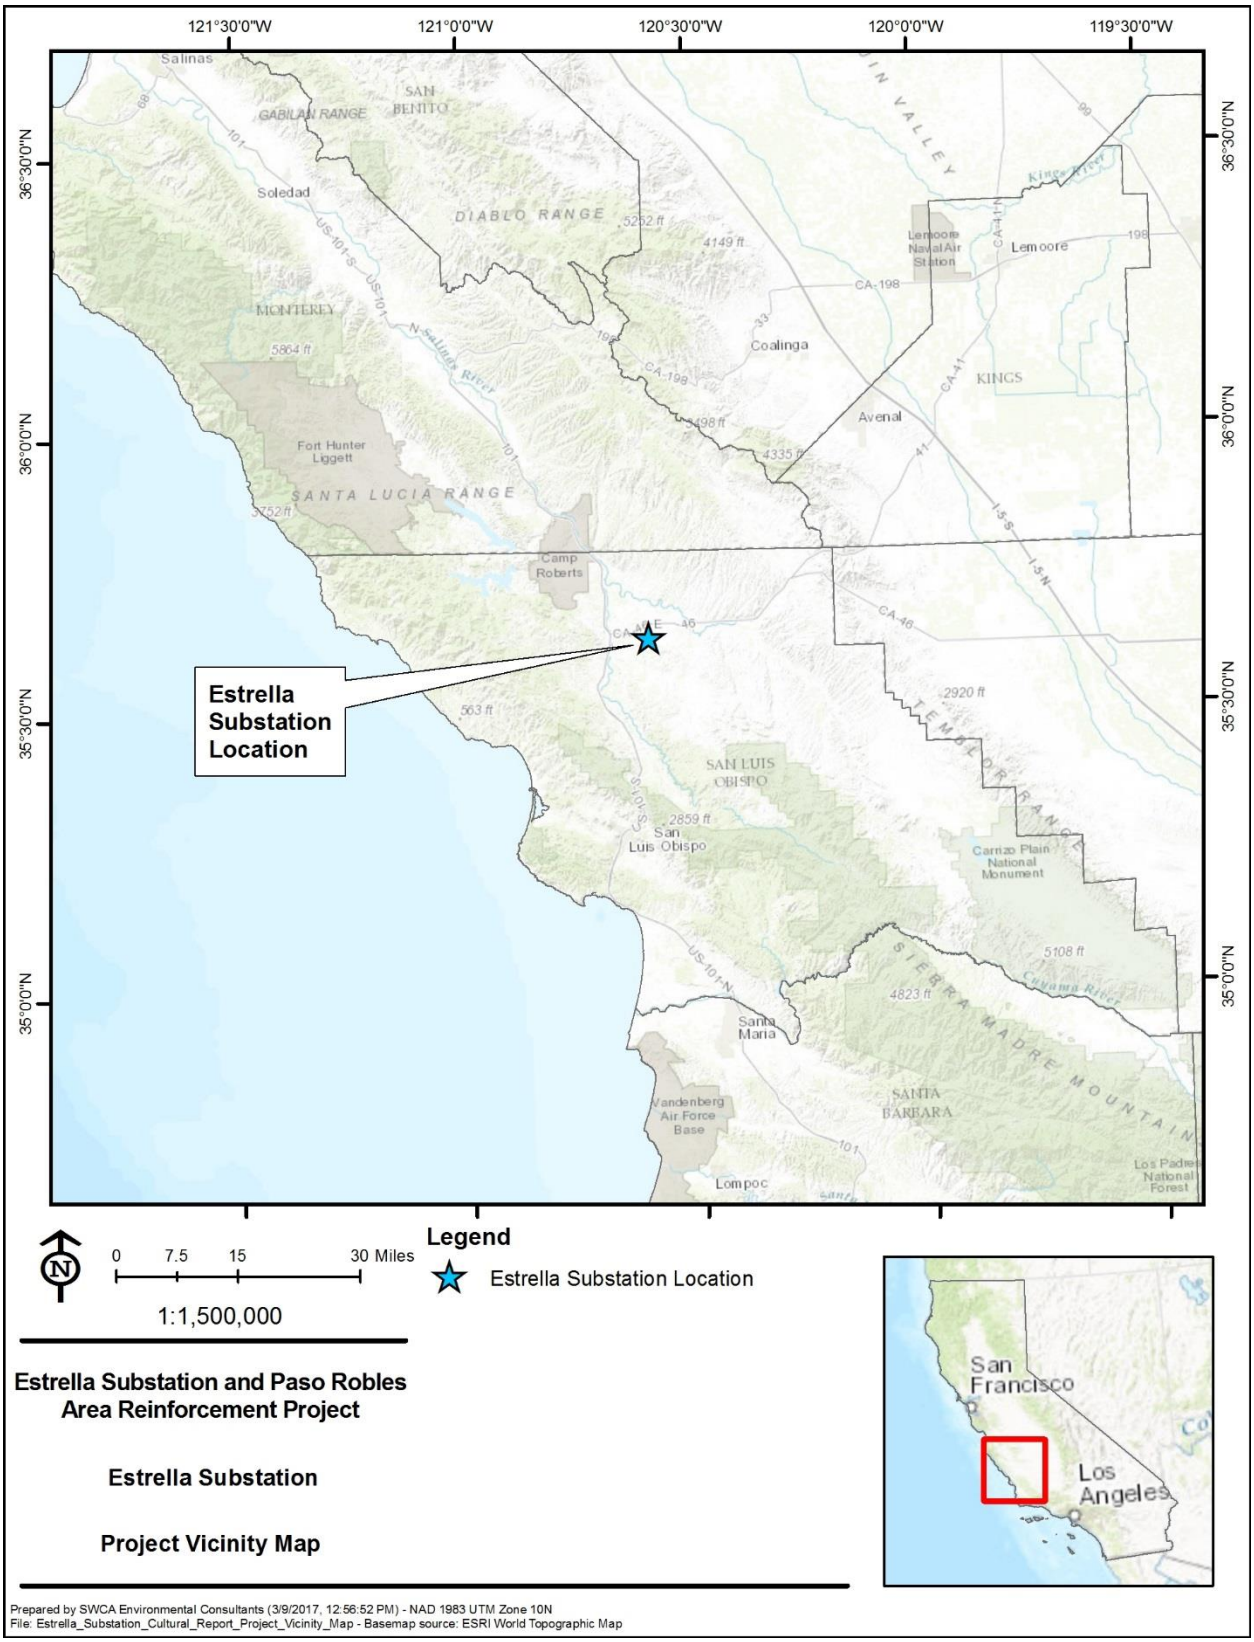

Figure 2. Estrella Substation Project Location Map

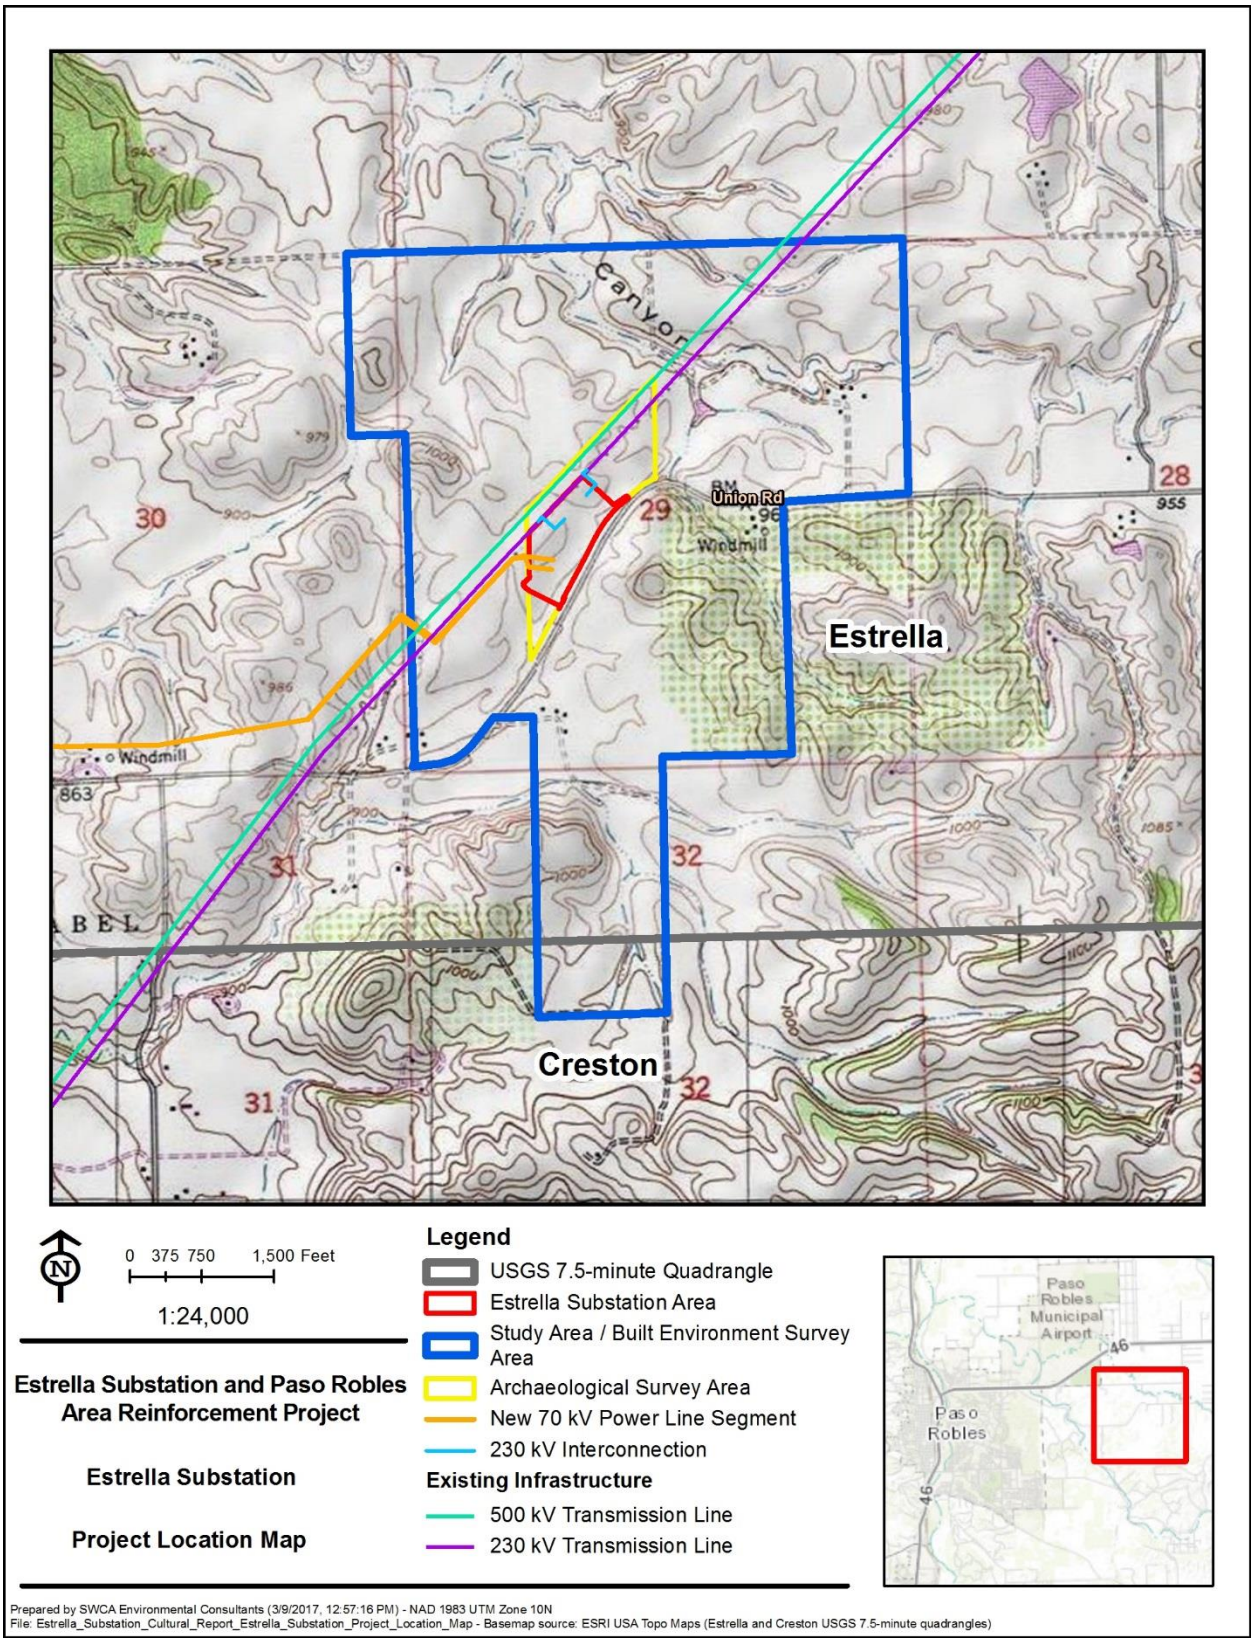

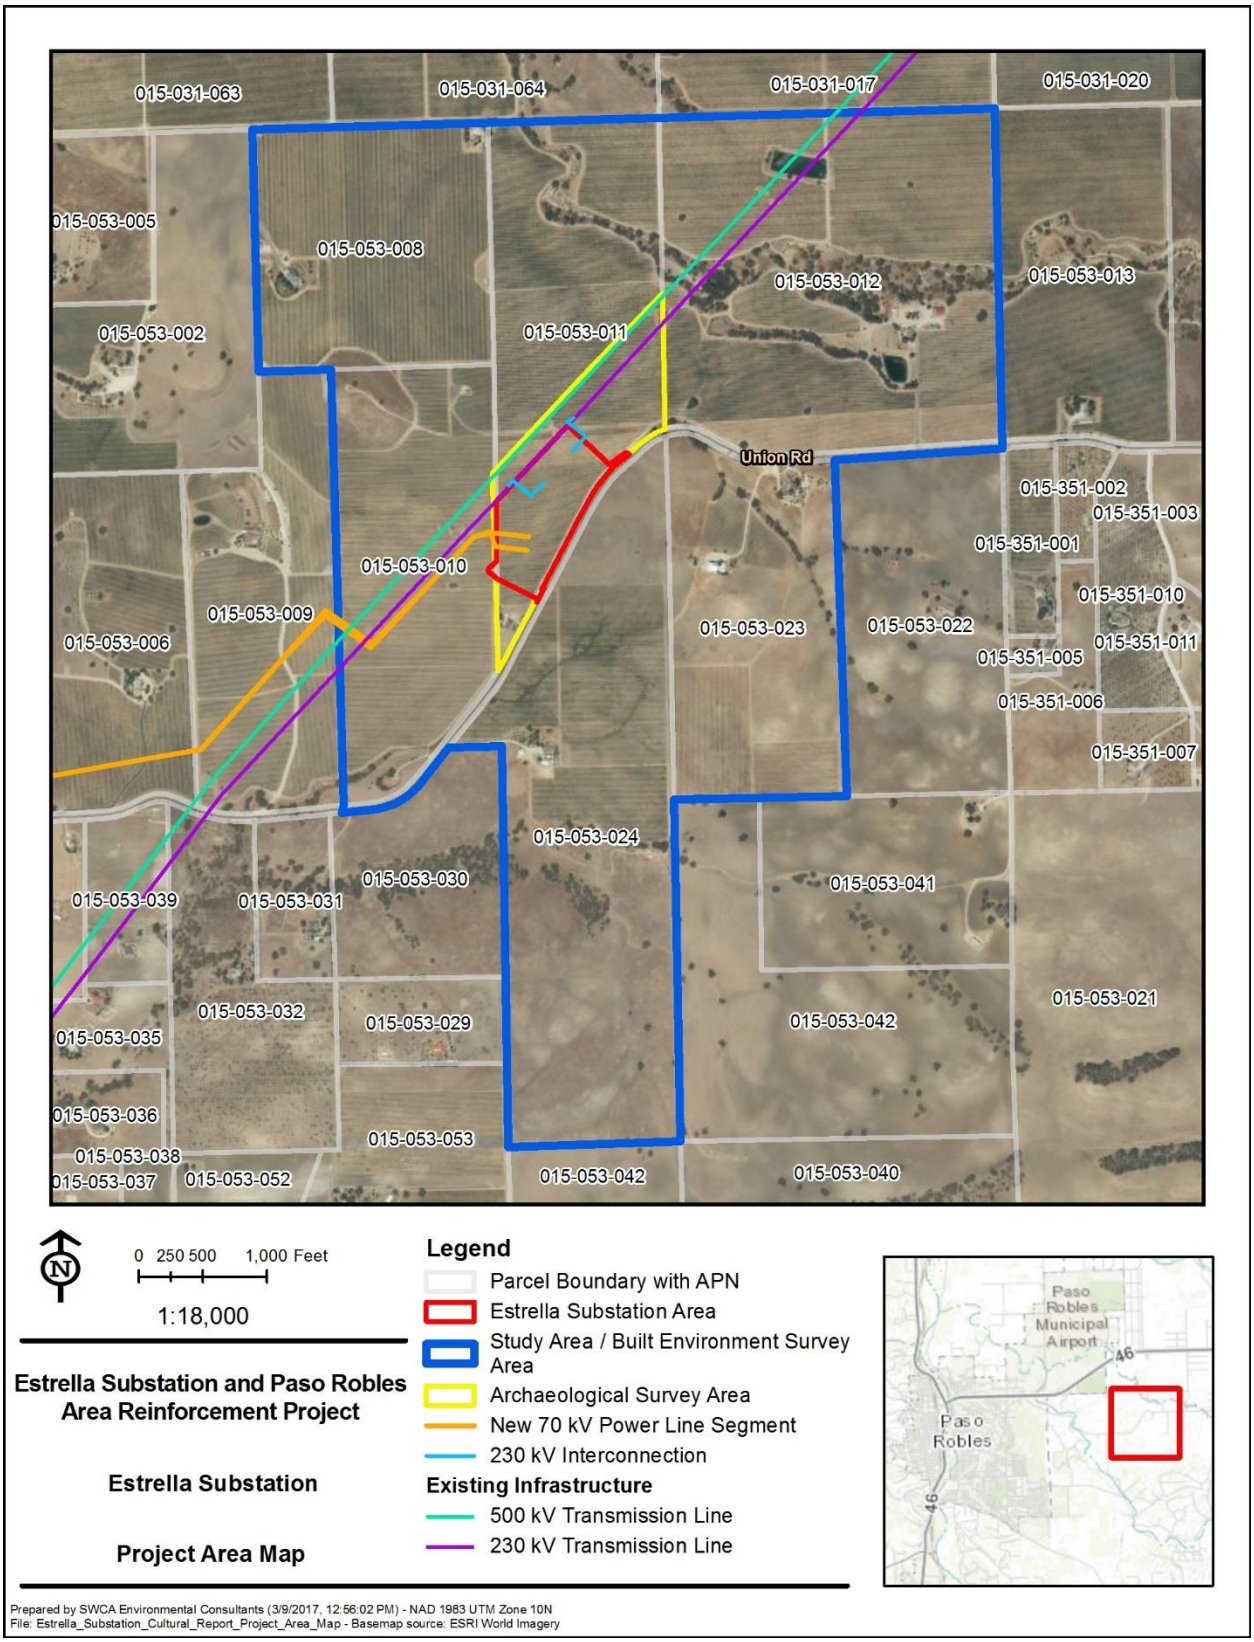

Figure 3. Estrella Substation Project Area Map

1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The project substation site is located on approximately 15 acres within an approximately 98-acre privately owned parcel (Assessor's Parcel Number [APN] 015-053-011).

1.2 Project Component

Estrella Substation will be comprised of two separate and distinct substations. One 230 kV substation will be constructed, operated, and owned by NEET West and one 70 kV substation will be constructed (following site preparation and rough grading work by NEET West), operated, and owned by PG&E. The 230 kV substation will be interconnected to the existing adjacent 230 kV transmission line. Access to the Estrella Substation site will be off Union Road, on a new main private access road.

2 REGULATORY FRAMEWORK

2.1 Federal

A federal agency is not approving, implementing, or funding the project or any element of it; therefore, Section 106 of the National Historic Preservation Act (NHPA) and the Paleontological Resources Preservation Act do not apply to this project.

2.2 State

2.2.1 California Register of Historical Resources

Under Section 21083.2 of CEQA, an important archaeological or historical resource is an object, artifact, structure, or site that is listed on, or eligible for listing on, the California Register of Historical Resources (CRHR). Eligible resources are those that can be clearly shown to meet any of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Is associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Automatic listings include properties that are listed on the National Register of Historic Places (NRHP). In addition, Points of Historical Interest nominated from January 1998 onward are to be jointly listed as Points of Historical Interest and in the CRHR.

Resources listed in a local historic register or deemed significant in a historical resources survey, as provided under PRC Section 5024.1(g), are presumed to be historically or culturally significant unless the preponderance of evidence demonstrates that they are not. A resource that is not listed on or determined to be ineligible for listing on the CRHR, not included in a local register of historical resources, or not deemed significant in a historical resources survey may nonetheless be historically significant, as determined by the lead agency (PRC Section 21084.1 and Section 21098.1).

2.2.2 Assembly Bill 52

Assembly Bill 52 (AB 52) established that Tribal Cultural Resources (TCR) must be considered by the lead agency under CEQA and also provided for additional Native American consultation requirements to be undertaken by the lead agency. A TCR is a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe, and is:

1. On the CRHR or a local historic register;
2. Eligible for the CRHR or a local historic register; or
3. The lead agency determines that the resource meets the register criteria.

A project that has potential to impact a TCR such that it would cause a substantial adverse change constitutes a significant effect on the environment unless mitigation reduces such effects to a less-than-significant level. The Governor's Office of Planning and Research (OPR) has issued revised CEQA Guidelines to incorporate AB 52 requirements.

Under AB 52, California Public Utilities Commission (CPUC) will conduct consultations with eligible tribes regarding TCRs once the Preliminary Environmental Assessment application is deemed complete and CPUC begins CEQA review of the project

2.2.3 California Health and Safety Code and Public Resources Code

Broad provisions for the protection of Native American cultural resources are contained in the California Health and Safety Code, Division 7, Part 2, Chapter 5 (Sections 8010 through 8030).

Several provisions of the PRC also govern archaeological finds of human remains and associated objects. Procedures are detailed under PRC Sections 5097.98 through 5097.996 for actions to be taken whenever Native American remains are discovered. Furthermore, Section 7050.5 of the California Health and Safety Code states that any person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes human remains in or from any location other than a dedicated cemetery without authority of law is guilty of a misdemeanor, except as provided in Section 5097.99 of the PRC. Any person removing human remains without authority of law or written permission of the person or persons having the right to control the remains under PRC Section 7100 has committed a public offense that is punishable by imprisonment.

PRC Chapter 1.7, Section 5097.5/5097.9 (Stats. 1965, c. 1136, p. 2792), entitled *Archaeological, Paleontological, and Historical Sites*, defines any unauthorized disturbance or removal of a fossil site or remains on public land as a misdemeanor and specifies that state agencies may undertake surveys, excavations, or other operations as necessary on state lands to preserve or record paleontological resources.

2.3 Local

Because CPUC has exclusive jurisdiction over project siting, design, and construction, the project is not subject to local discretionary regulations.

3 PROJECT SETTING

3.1 Environmental Setting

The project substation site is located at an elevation of approximately 925 feet to 959 feet above mean sea level. It is located within the southern Salinas Valley, bounded on the west by the Santa Lucia Range and

the east by the Temblor Range. The Santa Lucia Range is a portion of the Coast Range, a mountain chain extending up to 30 miles inland that runs from Northern California to Santa Ynez (Duvall 2004). The vicinity is typical of the Coast Range, with gradual hills, tall parallel peaks, and slow-moving rivers and creeks being the predominant geological features in the area. Small creeks and drainages flow into Huerhuero Creek and Estrella River, tributaries to Salinas River. Dry Creek, an ephemeral tributary to Huerhuero Creek, passes approximately 1,500 feet to the north. Estrella Substation is located in agricultural wine grape cultivation lands surrounded by patches of native vegetation. The native plant community adjacent to Estrella Substation is blue oak woodlands.

Blue oak woodlands are typically dominated by large stands of blue oak trees, or a mixture of blue oak (*Quercus douglasii*) and valley oak (*Quercus lobata*) trees with an understory of native and nonnative grasses and forbs. Blue oak woodlands are characterized by upland valleys with gentle to steep slopes. Soils within blue oak woodland are typically shallow, infertile, and moderately to excessively drained with extensive rock fragments. Soil surfaces may be covered with stones or have interspersed rocky outcrops (Sawyer et al. 2009). Blue oak woodlands may provide nesting or foraging habitat for avian species or may serve as a migration corridor for various wildlife species, such as San Joaquin kit fox (*Vulpes macrotis mutica*). Animals typically present in the vicinity of Estrella Substation include include mule deer (*Odocoileus hemionus*), coyote (*Canis latrans*), and bobcat (*Lynx rufus*). Common animal species observed at the time of the study include western fence lizard (*Sceloporus occidentalis),* red-tailed hawk (*Buteo jamaicensis*), acorn woodpecker (*Melanerpes formicivorus*), western scrub jay (*Aphelocoma californica)*, California thrasher (*Toxostoma redivivum)*, red-winged blackbird (*Agelaius phoeniceus)*, and California ground squirrel (*Spermophilus beecheyi*).

3.2 Cultural Setting

3.2.1 Prehistoric Overview

California prehistory is divided into three broad temporal periods that reflect similar cultural characteristics throughout the state: Paleoindian Period (ca. 9000–6000 B.C.), Archaic Period (6000 B.C.–A.D. 500), and Emergent Period (A.D. 500–Historic Contact) (Fredrickson 1973, 1974, 1994). The Archaic is further divided into Lower (6000–3000 B.C.), Middle (3000–1000 B.C.), and Upper (1000 B.C.–A.D. 500) Periods. These divisions are generally governed by climatic and environmental variables, such as the drying of pluvial lakes at the transition from the Paleoindian to the Lower Archaic period.

The project substation site is located in the Central Coast Archaeological Region, which is one of eight arbitrary organizational divisions of the state (Moratto 1984:Figure 1). This region extends southward from Monterey Bay through Big Sur to Morro Bay, and includes southern Santa Cruz and Santa Clara Counties, all of San Benito and Monterey Counties, and most of San Luis Obispo County.

Several chronological sequences have been devised to understand cultural changes within the Central Coast Region subsequent to the Paleoindian and Milling Stone Periods. The Milling Stone Period (ca. 6500–3500 B.C.) was first described by Wallace (1955, 1978) as part of his synthesis of earlier studies and development of a comprehensive southern California coastal region sequence, a chronological scheme that is still widely used today. Initially, Central Coast researchers relied on the cultural sequences developed for the San Francisco Bay area to the north, the Central Valley to the east, and the Santa Barbara region to the south. Breschini and Haversat (1980) proposed the Sur and Monterey Patterns to describe Central Coast occupations dating younger than 5,000 years. Jones and Waugh (1995) presented an integrated Central Coast sequence after the development of cultural resource management in the 1980s and ensuing excavations of numerous archaeological sites. Three periods are presented in their prehistoric sequence subsequent to the Milling Stone Period: Early, Middle, and Late Periods.

More recently, Jones and Ferneau (2002:213) updated the sequence following the Milling Stone Period, as follows: Early, Early-Middle Transition, Middle, Middle-Late Transition, and Late Periods. We rely here on the Jones and Ferneau (2002) chronological sequence for the Prehistoric Period within the Central Coast Region subsequent to the Paleoindian and Milling Stone Periods. It has become apparent that the archaeology of the Central Coast Region subsequent to the Milling Stone Period is distinct from that of the Bay Area and Central Valley, although the region has more in common with the Santa Barbara Channel area during the Middle and Middle-Late Transition Periods, but few similarities during the Late Period (Jones and Ferneau 2002:213). Jones et al. (2007) take a similar approach.

Prehistoric sites found in the vicinity of Estrella Substation are typically near creeks and may consist of isolated chert lithics or lithic scatters, ground stone (portable mortars, pestles, bedrock mortars and/or cupules), and/or sparse pockets of midden soils. Habitation sites are seasonally occupied camps and small villages (Glover et al. 1999).

3.2.1.1 PALEOINDIAN PERIOD/PALEO-COASTAL TRADITION (PRE-8000 B.C.)

Occupation of California's Central Coast Region is estimated to have occurred as early as the terminal Pleistocene/early Holocene, or about 10,000 years ago when sea levels were some 15–20 meters lower than today (Bickel 1978:7). Although there is evidence of occupation of the area during the early Holocene, only a few documented archaeological sites within the Central Coast Region can be assigned to a time period prior to about 6,000 years ago. It is likely that most sites of this period within this region are either beneath today's ocean waters or destroyed by coastal erosion. Estimates place the early Holocene shore in central and southern California at some 10 kilometers farther west of the present coastline (Breschini and Haversat 1991:126). An example of the possible early antiquity of additional Central Coast sites is the evidence for early occupation on two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area about 10,000 years ago (Erlandson 1991:105). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002).

Data from sites during this period indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002), as well as on Pleistocene lakeshores in the now arid lands of southeastern California (Moratto 1984:90–92). A Paleo-Coastal Tradition was proposed to highlight the distinctive marine and littoral focus identified within the central and southern California coastal archaeological record prior to the succeeding Milling Stone Period (Mason and Peterson 1994:57–58; Moratto 1984:104). At coastal sites, there is abundant evidence that marine resources such as fish, sea mammals, and shellfish were exploited during the Paleo-Coastal Tradition.

Few fluted projectile points, diagnostic of the Paleoindian Period, have been recovered from the coastal region, but they usually occur in isolated surface finds (Mills et al. 2005). A fluted point fragment is known from the coastal Santa Barbara Channel area, from site CA-SBA-1951 on the coastal plain (Erlandson 1994:44; Erlandson, et al. 1987). Another fluted point has been reported from Nipomo in San Luis Obispo County (Mills, et al. 2005), one of two surface isolated finds in San Luis Obispo County.

Erlandson and Colten (1991) note that there are some 75 southern and central California coast sites older than 5500 B.C. Breschini and Haversat (1991:126) list a total of eight sites in the Central Coast Region that may be assigned to the early Holocene. Four of the sites are inland, possibly beside a lake or marshy creek, and four sites were likely adjacent to embayments and steep rocky cliffs. At the most northern of the eight sites, CA-SCR-177, an inland site in Santa Cruz County, stone tools have been found in deposits dating to more than 6,000 years ago (Breschini and Haversat 1991:128–129). The other seven sites are near the

southern coastal boundary of San Luis Obispo County, range in age between 7,000–9,000 years old, and contain mostly lithics and shellfish remains.

Large side-notched points of the Central Coast Stemmed series in this region date to as early as 8,000 years ago (Justice 2002). Points of this type have been recovered at Diablo Canyon (CA-SLO-2; Greenwood 1972), Cross Creek (CA-SLO-1797; Fitzgerald 2000), Little Pico Creek (CA-SLO-175; Jones and Waugh 1995), and the Honda Beach site (CA-SBA-530; Glassow 1997), among others.

Several recently investigated sites also provide clear evidence for occupation within the Central Coast Region during the Paleo-Coastal Tradition. CA-SLO-1764 (Lebow et al. 2001) and Cross Creek (CA-SLO-1797; Fitzgerald 2000), both near Santa Margarita in San Luis Obispo County, and CA-SLO-832 (Jones et al. 2001) near Pismo Beach, have produced radiocarbon dates from approximately 9,000 years ago (Jones and Ferneau 2002).

3.2.1.2 MILLING STONE PERIOD (CA. 8000–3500 B.C.)

The Milling Stone Period, initially defined by Wallace (1955, 1978) is characterized by an ecological adaptation to collecting, and by the dominance of the principal ground stone implements generally associated with the horizontal motion of grinding small seeds, namely milling stones (metates, slabs) and hand stones (manos, mullers), which are typically shaped. Milling stones occur in large numbers for the first time, and are even more numerous near the end of this period. The Milling Stone Period is also defined by large, simple core and flake tools, and large side-notched projectile points. As testified by their toolkits and shell middens in coastal sites, people during this period practiced a mixed food procurement strategy. Subsistence patterns varied somewhat as groups became better adapted to their regional or local environments.

Milling Stone Period sites are common in both coastal and inland settings in central and southern coastal California, dating as early as 8,500 years ago. The Milling Stone Period is roughly correspondent with King's (1981, 1990) Early Period of the Santa Barbara Channel area, although King's Early Period lasts longer (5500–1350 B.C.). The Cross Creek site (CA-SLO-1797) is a Milling Stone Period occupation site in San Luis Obispo that returned radiocarbon dates ranging between 9,500–4,700 years ago (Fitzgerald 2000:58). This appears to be the oldest recorded mainland shell midden site, and the first coastal residential site to yield pre-8,000-year-old dates (calibrated to two-sigma). Four large, side-notched chert projectile points, 12 flaked stone cores, and two *Olivella* shell beads were recovered among the milling slabs and handstones that dominated the artifact assemblage from the site.

Along Central Coast areas, Milling Stone Period sites are common on terraces and knolls, typically set back from the current coastline (Glassow et al. 1988:68; Erlandson 1994:46). The larger sites usually contain extensive midden deposits, possible subterranean house pits, and cemeteries. Most of these sites probably reflect intermittent use over many years of local cultural habitation and resource exploitation. Erlandson has noted that the typical Milling Stone tools are not common on contemporaneous Channel Island sites, possibly reflecting an alternate, insular resource exploitation (Erlandson 1994:47). On the Santa Barbara coastline in the Gaviota Creek environs, Early Holocene evidence has been identified at CA-SBA-97 by Stephen Bowers (Erlandson 1994:39), and at nearby CA-SBA-96 by D.B. Rogers (1929:256; Erlandson 1994:40).

The Scotts Valley site (CA-SCR-177) in Santa Cruz County and CA-SCL-178 in Santa Clara County may provide evidence for early Holocene activities in the broader region (Cartier 1982:229, 1993; but see Moratto 1984:109–110 and Erlandson 1994:242–245 for critical review). Although the Scotts Valley site was not excavated in a manner that allows for accurate reconstruction of intrasite stratigraphy, the stone

tool assemblage and obtained radiocarbon dates do appear to correlate with the Milling Stone Period (Fenenga 1987).

3.2.1.3 EARLY PERIOD AND EARLY–MIDDLE TRANSITION PERIOD (3500–600 B.C.)

Although Jones and Ferneau (2002:213) have distinguished an Early-Middle Transition Period, it is not well defined. Thus, the transition phase is included in the following discussion of the sites and characteristics recognized for the Early Period in the Central Coast Region.

There is an extensive series of shoreline midden deposits within the Central Coast Region during the Early Period, signifying an increase in occupation of the open coast (Jones 1995; Jones and Waugh 1995, 1997). These include estuarine sites such as CA-SLO-165 in Estero Bay and open-coast sites in the Monterey Bay area, including CA-MNT-73, CA-MNT-108, and CA-MNT-1228. Lithic artifact assemblages from these sites include Central Coast Stemmed Series and side-notched projectile points. Square stemmed and side notched points have also been found in deposits at Willow Creek in Big Sur (CA-MNT-282) and Little Pico II on the San Luis Obispo coast (CA-SLO-175) (Jones and Ferneau 2002).

The material culture recovered from Early Period sites within the Central Coast Region provides evidence for continued exploitation of inland plant and coastal marine resources. Artifacts include milling slabs and handstones, as well as mortars and pestles, used for processing a variety of plant resources. Bipointed bone gorge hooks were used for fishing. Assemblages also include a suite of *Olivella* beads, bone tools, and pendants made from talc schist. Abalone square beads have been found in Monterey Bay, but not yet in the Big Sur or San Luis Obispo areas (Jones and Waugh 1997:122).

Data recovered from Early Period sites in the Central Coast Region indicate marine mammals were more extensively hunted on the Monterey Peninsula as compared to Big Sur (Jones and Waugh 1997:123). At Big Sur sites, terrestrial animals dominate the faunal assemblages. The introduction of the mortar and pestle, as well as the trend toward a decrease in mollusk size seen at some sites (e.g., CA-MNT-1232/H) on the Big Sur coast, indicate resource exploitation had intensified in concert with extended periods of occupation at residential bases.

Shell beads and obsidian are hallmarks of the trade and exchange networks that flourished on the central and southern California coasts. Beginning at the end of the Milling Stone Period, the archaeological record indicate there was a substantial increase in the abundance of obsidian at Early Period sites in the Monterey Bay and San Luis Obispo areas (Jones and Waugh 1997:124–126). Obsidian trade continued to increase during the following Middle Period. At present, not much information is available on shell beads in the Central Coast Region, but it appears there may have been a manufacturing center in the Monterey Bay area at two sites (CA-MNT-108 and CA-MNT-391).

3.2.1.4 MIDDLE PERIOD (600 B.C.–A.D. 1000)

During the Middle Period, there is a pronounced trend toward greater adaptation to regional or local resources. For example, the remains of fish, land mammals, and sea mammals are increasingly abundant and diverse in sites along the California coast. Related chipped stone tools suitable for hunting are more abundant and diversified, suggesting a wider range of specialized tasks, and shell fishhooks become part of the toolkit during this period. Larger knives, a variety of flake scrapers, and drill-like implements are common during this period. Projectile points include large side-notched, stemmed, and lanceolate or leaf-shaped forms. Bone tools, including awls, are more numerous than in the preceding period, and the use of asphaltum adhesive is now common.

Notable introductions included the circular shell fishhooks at the start of the period. The introduction of shell fishhooks and the increased use of other capture devices, such as nets, appear to have led to a substantial focus on fishing in most coastal areas. While seasonal settlement patterns (i.e., use of seasonal camps or temporary resource utilization areas) were still followed, large, permanently occupied settlements, particularly in coastal areas, are also present by the end of the period.

During the Middle Period, residential shell midden sites are fairly common in the Central Coast Region (Jones and Ferneau 2002:213). Well-dated Middle Period sites along the central coast are found at Willow Creek (CA-MNT-281 and CA-MNT-282) in Big Sur, Little Pico Creek (CA-SLO-175, CA-SLO-1259) on the San Luis Obispo coast, and Vierra (CA-MNT-229) in the Monterey Bay area. Artifact assemblages from these sites include large contracting-stemmed projectile points, occasional concave-base points, bone tools, milling slabs and handstones, bowl mortars, pestles, and a suite of *Olivella* bead types (A2, B2b, B2c, and G2) (Jones and Waugh 1995:120; Jones and Ferneau 2002:213). Fishing technology found at these coastal sites includes circular shell fishhooks and bone gorge fishhooks, as well as grooved stone net weights and pitted stones. Plant processing equipment at some of the sites is exclusively bowl mortars and pestles, and handstones and slabs at other sites (Jones and Ferneau 2002:215).

A dietary focus on marine resources during the Middle Period is consistent with the location of most sites on the shoreline (Jones and Ferneau 2002:218). Dense concentrations of fish, including herring, sardine, surfperches, and silversides, have been recovered from sites located alongside estuaries, such as CA-SLO-165 at Morro Bay and CA-MNT-234 at Elkhorn Slough. Rockfish and cabezon are represented at open coast sites, such as CA-SLO-175 and CA-MNT-63. Mammal and bird remains have also been found within Middle Period assemblages, and typically include sea otters, deer, and rabbits.

Although burial populations are fairly limited, burials within residential middens have been recovered at Middle Period sites in San Luis Obispo and Monterey Counties (Jones and Ferneau 2002:217). Most of the burials are primary interments, generally flexed, although some secondary burials have been recovered. There is little evidence of formal cemeteries like those found in the Bay Area to the north. Grave goods include *Olivella* shell saucer beads (type G2), bone tubes and whistles, drilled steatite tube and pebble ornaments, abalone ornaments, bowl mortars, and projectile points.

3.2.1.5 MIDDLE–LATE TRANSITION PERIOD (A.D. 1000–1250)

During the Middle to Late Transition Period within the Central Coast Region, projectile points generally diagnostic of both the Middle and Late Periods co-occur (Jones and Ferneau 2002:217). The points include large contracting-stemmed types found during the Middle Period, plus Late Period small leaf-shaped points, which likely represent the introduction of the bow and arrow. Additionally, hopper mortars are apparently introduced during this transition phase.

This transition period is marked by relative instability and change, with major changes in diet, settlement patterns, and interregional exchange. The relatively ubiquitous Middle Period residential shell midden sites found in this region were abandoned by the end of the transition period, so most Middle-Late Transition Period and Late Period sites were first occupied during those periods (Jones and Ferneau 2002:213, 219). During this transition period, the climate fluctuated between cooler, wetter periods and warmer, drier periods. During cooler, wetter periods, alluvial deposition increased; comparatively little deposition occurred in the drier intervals. Extended periods of relatively little rainfall, referred to as the Medieval Climatic Anomaly (MCA), produced droughts across the West between about A.D. 650–850 and A.D. 1150–1250 (Jones et al. 1999). Dry conditions during the MCA may be related to the abandonment of the coastal shell mound villages as primary residential locations. Settlement strategies were apparently reorganized and focused on a dispersed pattern, with the establishment of both coastal and interior habitation areas, coinciding with the exploitation of seasonally available resources.

Well-dated Transition Period occupation sites include CA-MNT-1233 and CA-MNT-281 in the Big Sur area, CA-MNT-3 in the Monterey Peninsula, and CA-SLO-1796 near Pismo Beach. The period is marked in both the Big Sur and San Luis Obispo areas by unique Cambria double side-notched projectile points, like those recovered from site CA-SLO-175 (Jones and Waugh 1995). Artifact assemblages from Transition Period sites also include bowl mortars, pestles, handstones, and milling slabs, as well as circular fishhooks and stone disks used for fishing. As discussed by Jones and Ferneau (2002:218), two unusual items recovered from CA-MNT-281 and CA-SLO-1796, respectively, include a small-incised slate tablet and a *Megathura* limpet ornament.

Evidence of trade and exchange is also represented in Middle Period sites, particularly in the abundance of obsidian items. Obsidian was obtained from sources from 200 to 400 kilometers away from the Central Coast Region. Obsidian from the Coso volcanic field dominates the Big Sur and San Luis Obispo area sites during this period. In the Monterey Bay area, Casa Diablo obsidian is more prevalent.

Like their Middle Period antecedents, dense concentrations of fish bones have been recovered from Transition Period sites on the open coast (Jones 1995; Jones and Ferneau 2002:219). There is also some indication that residents relied on smaller fauna, including anchovies and rabbits.

The sites at both Little Pico Creek and Willow Creek contain burials, some of which are group interments, with individuals in an extended position (Jones and Ferneau 2002:217–218). In addition to the diagnostic Cambria points, grave goods include several *Olivella* bead types (B2, B3, G2, and K1); *Olivella* G1 saucer beads may be diagnostic of this period.

3.2.1.6 LATE PERIOD (A.D. 1250–HISTORIC CONTACT)

Cultural materials, such as temporally diagnostic shell beads and small, finely worked projectile points, help identify Late Period sites throughout California. The small projectile points are associated with bow and arrow technology. Although shell beads were typical of coastal sites, trade brought many of these maritime artifacts to inland locations, especially during the latter part of the Late Period. The end of the eighteenth century, when the Spanish mission system had its greatest effect on native Californian populations, is generally agreed upon as the terminal point of the Late Period.

Overall patterns of occupation within the Central Coast Region indicate that sites inhabited during the Middle Period show in most cases little or no evidence of being occupied continuously into the Late Period (Jones and Ferneau 2002:213, 219–220). This holds true for the Monterey Peninsula as well as the Morro Bay areas, although much of the region still lacks a large inventory of well-sampled and well-dated Late Period components. Rare exceptions have been found at one Big Sur site (CA-MNT-376) and two sites on the northern San Luis Obispo coast (CA-SLO-2 and CA-SLO-267).

Unlike the large Middle Period shell middens, Late Period sites are more frequently single-component deposits. There are also more inland sites, with fewer and less visible sites along the Pacific shore during the Late Period. The settlement pattern and dietary reconstructions indicate a lesser reliance on marine resources than observed for the Middle Period and Middle-Late Transition Period, as well as an increased preference for deer and rabbit (Jones 1995). An increase in sites with bedrock mortars during the Late Period further suggests that nuts and seeds began to take on a more significant dietary role.

A well-dated Late Period site along the Big Sur coast, CA-MNT-1223, produced seven radiocarbon dates between A.D. 1220 and 1720 (Jones 1995). The chipped stone tool assemblage includes Desert side-notched and Canaliño projectile points. Shell artifacts include circular fishhooks and *Olivella* beads (types A4, A5, E1a, E1b, and K1). Small steatite disk beads, as well as crude lithic microblades were also recovered from this site. Slab hopper mortars and pestles were the only ground stone artifacts recovered from CA-MNT-1223, although bedrock mortars and crude cobble pestles have been recovered from Late Period sites

located in the inland valleys (Jones and Ferneau 2002:218). Unlike Middle Period site assemblages, obsidian is not common in Late Period deposits (Jones and Ferneau 2002:225).

The microblade/drills recovered from CA-MNT-1223, as well as CA-SLO-214, are likely associated with the production of shell beads. The manufacture of shell beads is associated with the Santa Barbara Channel area, and is not well represented further north. In general, Late Period sites within the Central Coast Region have fewer traits in common with Santa Barbara Channel sites than found during the previous periods (Jones and Ferneau 2002:213).

3.2.2 Ethnographic Overview: Salinan

The project substation site is in an area traditionally considered by archaeologists to have been prehistorically and ethnohistorically occupied by the Salinan (Hester 1978; Kroeber 1925). Surrounding native groups include the Esselen and Ohlone to the north, the Southern Valley Yokuts to the east, and the Chumash to the south. However, recent research illustrates the uncertainty in the ethnographic record of such sociopolitical and linguistic boundaries. Gibson (1983:181–182) considers the Paso Robles area to be within the northern extent of the Chumash. This would place Estrella Substation just beyond the southeastern boundary of the Salinan language area (Rivers and Jones 1993:147). Milliken and Johnson's research (2005:128), based on ethnographic and linguistic data, suggests that Estrella Substation lies within the Salinan language area, but just east of the Chumash–Salinan boundary zone.

Estrella Substation lies within the ethnographic boundaries of a Salinan sub-group known as the Migueleño. Known ethnographic villages sites near Estrella Substation are *him'-se-en'* between Paso Robles and Templeton on the west side of the Salinas River, and a major village at *isolam* near the present-day community of Cholame (Hester 1978:500–501). Gibson (1983:180) additionally plots the tentative locations of the rancherias of *tixja* and *sososquiquia* in the vicinity of Estrella Substation. Jones et al. (2007) note the possible ethnonym of *Etsmal* for the tribal group in this area.

The Salinan language generally has been regarded as part of Hokan linguistic stock (Hester 1978:500; Shipley 1978:86), but more recent linguistic analysis indicates Salinan has no close relatives and no demonstrated connections to other languages (Mithun 2001:482). Mason (1918) recorded two Salinan dialects, northern (Antoniaño) and southern (Migueleño) divisions, associated with the people administered by the Spanish from Mission San Antonio de Padua and Mission San Miguel, established in l771 and 1797, respectively. Neophytes at the Mission San Antonio included Salinan living along the coast, referred to as "Playanos."

The semi-sedentary Salinan occupied a rugged, mountainous area on the south-central California coast (Kroeber 1925; Hester 1978). Heavily wooded hills and mountains of the South Coast Ranges dominated the interior, with sheer cliffs and rocky beaches along the Pacific coast. Salinan villages were recorded near the missions and along internal drainages, with some habitation areas along the coast (Hester 1978:501). No permanent sites were recorded in the Coast Range, although temporary camps were likely. Their subsistence economy was one of hunting and gathering. The surrounding environment was varied and rich, and they exploited the mountains, foothills, valleys, and coast. As with most native Californians, acorns were a staple food, supplemented by wild oats, sage seeds, berries, mescal, and wild fruits. Additional resources exploited by coastal and interior groups included large and small mammals such as deer, bear, and rabbits, as well as fish. The full extent of their villages is unknown, but Hester (1978:501) locates 21 from earlier records.

Salinan houses were domed, up to 10 feet square, constructed of poles and covered with tule or rye grass (Hester 1978:501). Other structures included birthing huts, dance houses, and semisubterranean sweathouses, among additional communal structures. Acorns were stored in willow-twig granaries. The

Antoniaño group practiced cremation of their most distinguished individuals. Among the Migueleño, the deceased were wrapped in skins and their possessions burned.

A variety of tools and implements, some of which are inferred from the archaeological record in the area, were employed by Salinan groups (Hester 1978:501). These included bows and arrows, traps, nets, blinds, slings, spears, harpoons, and hooks. Bone and shell tools included bone awls and C-shaped shell fishhooks. Foods were processed using stone mortars and pestles, metates, basket mortars, bedrock mortars, stone bowls, and wooden mortars. The Salinan also made a wide variety of baskets. Cooking baskets and earth ovens were used in food preparation.

There is little recorded of Salinan subsistence economy by ethnographers, but they would have taken full advantage of the plant and animals resources available in the river valley, foothills, and mountains within their territory. They also had a stretch of coastline from which to gather shellfish, fish, and marine mammals.

Ornaments included items made of steatite, serpentine, and abalone shell. Clothing included basket hats, rabbitskin or otterskin cloaks, and tule aprons. The Salinan also used beads made from mussel and abalone shell for currency and had musical instruments, such as cocoon rattles, wooden flutes, and bone whistles.

Some of Salinan material culture was obtained through an important trade network, established with neighboring groups (Hester 1978:500–501). In exchange for saltgrass salt, obsidian, seeds, lake fish, and possibly tanned animal skins, Salinan groups traded shell and shell beads with the Yokuts to the east. Shell ornaments, wooden dishes, and steatite vessels were obtained from the Chumash to the south, but apparently, the Salinan did not trade with a rival trade group, the Costanoan to the north.

Like other indigenous Californians living near the coastal missions, Salinan population decreased rapidly after the arrival of the Spanish. A relatively small population to begin with, the Salinan were decimated by diseases introduced by the missions and later settlers. By 1831, their number was fewer than 700, and their population continued to decrease even more rapidly after secularization of the missions (Hester 1978:503). By the turn of the twentieth century, only three families survived within their traditional territory. The California Indian Roll of 1928 registered only 36 Salinans, and research 5 years later could only locate one Antoniaño family, comprised of four elderly siblings (Hester 1978:503).

3.2.3 Historical Overview

Post-contact history for the state of California generally is divided into three specific periods: the Spanish Period (1769–1822), the Mexican Period (1822–1848), and the American Period (1848–present). Although there were brief visits by Spanish, Russian, and British explorers from 1529–1769, the Spanish first settled California in 1769 with the first of 21 missions established from 1769–1823. The Mexican Period is marked by an extensive era of land grants, most of which were in the interior of the state, and by exploration by American fur trappers west of the Sierra Nevada Mountains.

With the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican-American War, California became a territory of the United States. The discovery of gold in 1848 at Sutter's Mill and the resulting Gold Rush era influenced the history of the state and the nation. The rush of tens of thousands of people to the gold fields also had a devastating impact on the lives of indigenous Californians, with the introduction and concentration of diseases, the loss of land and territory (including traditional hunting and gathering locales), violence, malnutrition, and starvation. Thousands of settlers and immigrants continued to pour into the state, particularly after the completion of the transcontinental railroad in 1869.

With continued growth, California continues to be a national leader in agriculture and poultry production, ranching (cattle and sheep), aerospace and communications industries, as well as the film and entertainment business. The wealth of California's natural resources (e.g., lumber, petroleum deposits, minerals, fish) also continues to contribute to its growth and development.

3.2.3.1 SPANISH PERIOD (1769–1822)

Spanish explorers made sailing expeditions along the coast of California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríguez Cabrillo sailed up the California coastline. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. The Spanish crown laid claim to California based on the surveys conducted by Cabrillo and Vizcaíno (Bancroft 1885:96–99; Gumprecht 1999:35). European contact in the San Luis Obispo County region may have begun as early as 1587 with the visit of Pedro de Unamuno to Morro Bay, although some scholars have questioned this based on the ambiguity of Unamuno's descriptions (Mathes 1968). A visit in 1595 by Sebastian Rodriguez Cermeño is better documented (Jones et al. 1994).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. The earliest well-documented descriptions of the Paso Robles area come from accounts by members of Portolá's land expedition, which passed through the region in 1769 (Squibb 1968). They named the area *El Paseo de Los Robles,* or "The Pass of the Oaks," after seeing the tall oaks that lined the narrow valley of the Salinas River. Permanent Spanish settlement of the region began with the founding of Mission San Antonia de Padua (near King City) in 1771, San Luis Obispo de Tolosa (in San Luis Obispo) in 1772, and Mission San Miguel in 1797. As elsewhere, induction into the missions had a devastating effect on the local inhabitants, requiring them to live and work at the mission and abandon their former lifeways. Under the guidance of the mission fathers, the natives were instructed in farming methods including the production of wheat, beans, and various kinds of fruit. The earliest farming was intended to foster independence for the missions, thus reducing the reliance on imported supplies. The inauguration of Spanish colonization brought about major and devastating changes to aboriginal society, due primarily to the introduction of European diseases. The consequent high mortality rate, and the pressure of overwhelming social change, decimated the population. By 1805, most native villages had been abandoned and the populace had either fled or moved into the mission system (Gibson 1983).

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period: Los Angeles (1781), San José (1797), and Villa de Branciforte (1797); only San José and Los Angeles were successful and remain as California cities. Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population.

3.2.3.2 MEXICAN PERIOD (1822–1848)

After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955:14).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. When the Mission system was secularized after 1834, the church's land holdings were distributed to private Mexican citizens, including approximately 500,000 acres within San Luis Obispo County. During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

3.2.3.3 AMERICAN PERIOD (1848–PRESENT)

War in 1846 between Mexico and the United States precipitated the Battle of Chino, a clash between resident Californios and Americans in the San Bernardino area. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. territories (Waugh 2003). During this time, many of the Mexican land grants passed into American ownership, extending the period of prosperity associated with the ranchos (Rivers 2000). Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through 1850s. The Gold Rush commenced in 1848, and with the influx of people seeking gold, cattle were no longer desired mainly for their hides, but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains where available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 2005:102–103).

Roads were constructed throughout the county in the 1870s, primarily by Chinese laborers. In 1872, Captain John Harford began construction on the Pacific Coast Railway, which linked his wharf in the coastal town of Avila with San Luis Obispo. By the time the Southern Pacific Railroad arrived in the 1880s, San Luis Obispo County, as well as the rest of California, was experiencing a significant land boom. The county was described as "the great butter and cheese belt of southern California," with affordable land priced between $18 and $25 per acre (Dumke 1944). By April 1887, an estimated 3,000 to 4,000 people inhabited the region, and land prices increased dramatically. In 1894, the Southern Pacific Railroad completed the line from San Jose to San Luis Obispo.

The advent of rail allowed for agricultural expansion throughout the region. Wine grapes were first introduced to the Paso Robles region by Spanish conquistadors and Franciscan missionaries in 1797. The first commercial winery was established in 1882, by Andrew York, an apple farmer from Indiana. York founded the Ascension Winery on his 240-acre property, which became well-known for their Zinfandel wines (Rice and Cervellone 2007). During the 1920s, other immigrants arrived in the region and established vineyards, including the Martinelli, Dusi, and Bianchi vineyards, establishing the region within the wine industry. By the 1940s over a dozen small family-owned wineries had been planted in to the east and west of Salinas River. By the 1980s, large corporate wineries began to plant in the Paso Robles region, and by the 1990s, European winemakers moved to the area to take advantage of the lack of restrictions on wineries. By 2007, the number of wineries had climbed to 170 in the Paso Robles region (Rice and Cervellone 2007).

The lands of Paso Robles were well-suited for farming. After the rancho land grants, the land was subdivided into smaller parcels for individual farming and stock ranching. The area first found farming success with wheat and barley. Orchard crops had been added by the turn of the last century and soon the county expanded in nuts and fruits. In 1912, the first commercial almond orchard was planted (Paso Robles Press 1928) and by 1926, there were 33,000 acres of almond planted (Los Angeles Times 1926). The city became known as the "City of Almonds" for the abundance of its orchards (Rice and Cervellone 2007). A poor crop in in 1934 saw the decline of almonds and, although they continued to be grown in the vicinity, by the 1980s there were approximately only 100 almond growers in area (Ittner 1987).

The county's success in agriculture and ranching continued throughout the twentieth century. The county's agricultural production supplied U.S. troops during World War I and helped its residents weather the Great Depression of the 1930s. At the start of World War II, the U.S. War Department transferred nearly 100,000 military personnel to bases at Camp San Luis, Camp Roberts, Morro Bay, and Cambria. In 1942, the Estrella Army Air Field was established and operated for 2 years. After the closure, the land and buildings were transferred to the County of San Luis Obispo (County) in 1947 to establish the Paso Robles Municipal Airport (Estrella Warbirds Museum 2015).

Today, San Luis Obispo County is an important agricultural area. By 2014 the Paso Robles region included more than 32,000 acres of vineyards and more than 200 wineries (Paso Wine 2016). In addition to wineries, the county's many beaches, state parks, and small-town atmosphere bring tourists from the nation and around the world. Hearst Castle, built by William Randolph Hearst from 1917 to 1947 in San Simeon, is a world-famous tourist attraction along the northern San Luis Obispo County coast, approximately 30 miles west of Paso Robles.

3.2.3.4 CITY OF EL PASO DE ROBLES

Although the project substation site is outside of the limits of Paso Robles, the city has historically served as an economic and transportation hub for the rural agricultural area that contains Estrella Substation. The City of El Paso de Robles (Spanish for "the pass of oaks," today often called simply Paso Robles) is situated on the former lands of the Rancho Paso de Robles. Once an outpost of the Mission San Miguel, the 25,993-acre rancho was granted to Pedro Navarez in 1844. In 1857, Navarez sold the rancho to a partnership consisting of Daniel and James Blackburn and Lazare Godchaux (Hoover et al. 2002). The rancho lands were subsequently divided up, with the present-day city boundaries falling under the holdings of the Blackburn brothers and brother-in-law, Drury James, who purchased Godchaux's interest in the rancho (Bowler 2003). In 1886, Blackburn and James laid out a plan to subdivide lots surrounding the hotel and establish the town of Paso Robles. It was the goal of Blackburn and James to establish a town site that would be the most important stop between San Francisco and Los Angeles.

The Southern Pacific Railroad arrived in October 1886, marking an important turning point in the development of Paso Robles. Rail transportation gave the town the opportunity to expand significantly, opening the resort to people previously unable to endure long stagecoach rides. Additionally, the arrival of the railroad allowed the town to expand its farming operations for long-distance shipping of crops, livestock, and byproducts (Bowler 2003). The region was particularly suited for growing almonds, walnuts, and grapes. In the late nineteenth and early twentieth centuries, European settlers planted vineyards and established the wine industry as a major component of the regional economy (Historic Resources Group 2010:17–18). By the 1940s, the population of El Paso de Robles had soared to over 3,000 residents and it was recognized as a resort community, attracting tourists from all over the world. Since the 1950s, the city has continued to expand and grow its population, while maintaining a diverse economy that includes agriculture and industry.

3.2.3.5 EAST OF PASO ROBLES: RANCHO SANTA YSABEL, HUERHUERO CREEK, DRY CREEK, AND THE ESTRELLA RIVER

The project substation site is in an area east of Salinas River that has been used for ranching and agriculture since the Mission period. Small settlements along Huerhuero/Dry Creek and the Estrella River developed slowly throughout the nineteenth century, and expanded more rapidly in the twentieth century along with mechanized agriculture. Trails and roads in the area have historically served to convey people and commodities between the Central Valley, the Salinas River, and maritime towns on the Pacific Ocean.

In 1844, the former mission land of Rancho Santa Ysabel was granted to Lieutenant Francisco Casimiro Arce by Governor Manuel Micheltorena. This land grant encompassed a 4-square-league tract of land on the eastern bank of Salinas River, opposite Rancho Paso de Robles (Gudde and Bright 1998:350; Hoffman 1862:A49). On June 10, 1846, Arce's contingent of the Mexican army was defeated by Ezekiel Merritt and other American settlers near Elk Grove, which emboldened the American insurgents to take Sonoma in the Bear Flag Revolt on June 14, 1846 (Kyle et al. 2002:306). Arce filed a claim to Rancho Santa Ysabel following the Mexican–American War, and was granted a patent in 1866 (State-Surveyor General 1886:17).

Rancho Santa Ysabel was purchased in 1886 by Chauncey Hatch Phillips' West Coast Land Company along with parts of Rancho Paso Robles and Rancho Huer-Huero to the south (Storke 1891:157). This purchase was later developed into present-day parts of Paso Robles and Templeton. In 1891, Santa Ysabel and this area east of the Salinas River was described as a fertile landscape for agriculture and ranching:

> *Santa Ysabel consists of 20,200 acres, adjoining the Rancho Paso de Robles at the northeast. For ten miles the Southern Pacific Railway runs along and within one-fourth mile of its boundary. It is covered with white and live-oak timber, although less thickly than the Paso de Robles. There are, substantially, 16,000 acres of plow land, the rest fruit and grazing land. The soil is rich and deep, and will produce wheat of the finest, barley, oats, corn, all fruits and vines, and olives. Wine and raisin-making will no doubt, be important industries of this section. On this rancho are twenty miles of running water, besides numerous living springs. Well water is had at ten to forty feet deep.* (Storke 1891:162)

By the 1860s, General Land Office survey plats show a sparse network of roads and trails connecting El Camino Real at Paso Robles and Mission San Miguel with Rancho Santa Ysabel and settlements to the east in the vicinity of present-day Shimmin's Canyon Road and Cholame, and which continue over the Temblor Range to Tulare Lake and the Central Valley. This early system of trails and wagon roads likely followed previous paths and fords established by the Migueleño as they travelled between villages and hot springs at the Salinas River and Cholame, and on seasonal resource-gathering migrations to the oak woodland uplands. Indeed, mission records document kinship ties between the village at Cholam and the rancheria of *assii*, near present-day Lockwood (Gibson 1983:182).

Segments of the present Union Road are plotted on 1869 General Land Office survey plats. This road appears to have originated at Rancho Santa Ysabel to the southwest, and possibly connected to the "*camina*" (road) roughly depicted on the Rancho Santa Ysabel diseño as connecting with El Camino Real in the vicinity of Rancho Paso de Robles on the western bank of the Salinas River River (University of California [U.C.] Berkeley 184-[?]). The historical alignment of Union Road plotted on the survey plat parallels another east–west road to the south which is labeled "Trail from San Luis Obispo to Cholame Ranch," and both roads appear to have connected with San Miguel Road (approximate alignment of Highway 46) to the east. An 1858 survey plat notes a spring, wheat field, "Indian cabins," and "Indian hut" at the intersection of Highway 46 and Shimmin's Canyon Road. Highway 46 continues east to the town and ethnographic village site of Cholame, and over the Temblor Range to Tulare Lake and the Central Valley.

The 1919 Paso Robles U.S. Geological Survey (USGS) 15-minute Quadrangle shows further development of this network of roads, which by then connected the well-developed city of Paso Robles, El Camino Real, the Southern Pacific Railroad, and the Salinas River to the west with the small settlements of Estrella, Bern, Union, Shandon, and Geneseo. At this time, rural residences were sparsely distributed along the roadways, leaving the landscape for ranching and agricultural uses. Several schools were in operation, including Dry Creek School, Estrella School, Phillips School, and Pleasant Valley School.

The Paso Robles Municipal Airport was originally built in 1942 for military use during World War II. It was taken over by the County in 1949, and was transferred to the City of El Paso de Robles (City) in 1973 (City of El Paso de Robles 2016a).

By 1948, the USGS 7.5-minute Quadrangle shows much of the early road network incorporated into the modern county and state highway system, including the present alignments of State Route (SR)-46, Union Road (former SR-41), Mill Road, and Estrella Road. Orchard and field croplands were present along Union Road at this time, while most of the surrounding lands were open space likely used for livestock grazing. While almonds, fruit, and field crops remain important agricultural products of the region, wine grapes were increasingly planted in the mid- and late-twentieth century. Hunter Ranch Golf Course was built in the early 1990s.

3.2.3.6 THE ERNST AND STEINBECK FAMILIES

The Estrella Substation footprint is presently used to grow grapes for Steinbeck Wines, a family-run winery that encompasses Estrella Substation.

In 1884, William Ernst and his two brothers responded to a newspaper article inviting families to move to California and start a Lutheran Church in San Luis Obispo County. Located just 4 miles east of Paso Robles, the Ernst brothers and their families helped establish the area of Geneseo, named for their home town in Illinois (Paso Robles Magazine 2013). The family farmed wheat, barley, and oats in addition to establishing a vineyard (The Daily Press 1989). The Ernst brothers planted about 25 different varieties of grapes and became well known for their wine making capability (San Luis Obispo Tribune 1900 and 1901). In 1921, William's son Frank and his wife, Rosetta "Rosie," purchased what is now Steinbeck Wines (Steinbeck Wines 2016) along with various parcels to the west. Their daughter, Hazel Wilhelmina Ernst, married Rev. George Louis Steinbeck in 1934, giving the family the Steinbeck name (Find a Grave 2011). Sometime after 1921, the family added the parcels immediately to the left and compressed Steinbeck Vineyards to the four adjacent parcels it comprises today. For 95 years, the Ernst and Steinbeck family has owned and operated the winery at its current location.

Rev. George Louis Steinbeck, son of Henry and Elise Steinbeck, was the second youngest of eight siblings. His father, Henry Steinbeck, was born in 1864 in Germany and immigrated to the United States in 1885. He operated a butcher shop in Oakland during the 1910s and 1920s. The family appears to have moved to the Paso Robles region sometime after 1930 for unknown reasons (Ancestry.com 2016a). Henry Steinbeck is the brother of John Ernst Steinbeck, Sr. Before moving to Salinas, John Steinbeck, Sr., had previously worked for the Ernst brothers as manager of the Sperry Milling and Flour Company facility in Paso Robles, where he lived with his wife, Olive Hamilton, and their first two children. After moving to Salinas, the couple had their only son, John Ernst Steinbeck, Jr., the Pulitzer and Nobel prize-winning author of *Of Mice and Men*, *The Grapes of Wrath*, and *East of Eden,* in 1902. John Steinbeck, Jr., matriculated to Stanford University after graduating from high school in 1919. Steinbeck, Jr., does not appear to have had significant ties to the Paso Robles area during his lifetime; instead, his biographers emphasize the influence of his early experiences in and around Salinas, and on his mother's family ranch near King City (Benson 1984; Parini 1994).

On April 11, 1956, a B-26 bomber crashed on the Steinbeck Wines property 600 feet from the house, and four of the five airmen survived. The injured airmen were sheltered in the Steinbeck home until medics responded. The crash site is now marked by a flagpole flying the American flag (Steinbeck Wines 2016).

3.2.4 Significant Themes

The following sections present significant themes relating to the types of resources identified within the project area. This includes discussions of residential development in Paso Robles and the surrounding area, the role of agriculture and wine grape cultivation, and the development of electric generation and transmission in San Luis Obispo County.

3.2.4.1 RESIDENTIAL DEVELOPMENT

The following section is largely paraphrased from *City of Paso Robles Historic Resources Survey* (Historic Resources Group 2010). With the establishment and growth of Paso Robles in the 1880s, residential development in the region primarily centered on the city's emerging city core west of Salinas River, while development east of the river was much more dispersed and consisted of small, family-run farms grouped in agricultural communities such as Linne, Shandon, and Cholame. Although the arrival of the Pacific Coast Railway and Southern Pacific Road's coastal route in 1886 encouraged a number of well-advertised land auctions and subdivisions, it did little to immediately increase growth in the region. Census records indicate the population in San Luis Obispo County only increased by 565 people between 1890 and 1900, and many of the tracts of land that were subdivided along the rail line remain undeveloped into the following decades.

While residences in the Paso Robles area that were constructed in the 1880s and 1890s were typically designed in Victorian-era styles, homes developed in the first decades of the twentieth century reflected new regional styles that were emerging across California. Most notable was the California bungalow, which was inspired by the Arts and Crafts movement and was well suited for the region. It remained the dominant style in Paso Robles through the 1920s, with a lesser number of Spanish and Mediterranean revival styles also constructed during this period. Residential construction comprised the majority of construction in the 1910s and 1920s and continued to be located primarily west of Salinas River. Similar to much of California and the rest of the country, residential development in Paso Robles slowed significantly during the Great Depression of the 1930s. In 1934, the Federal Housing Administration (FHA) was created as a result of the National Housing Act and provided financial incentives and guidelines for the construction of new homes. These guidelines promoted 624-square-foot, efficiently designed houses and outlined concepts of planning for parks, playgrounds, and commercial areas. An example of an FHA planned development in the northern edge of Paso Robles is the Oak Park neighborhood, which was developed in 1941. Other residential architecture from the 1940s remained primarily to the west of Salinas River and consisted of infill housing in previously-established neighborhoods.

Development eventually began to move east of Salinas River following World War II. While this area had continued to remain largely agricultural up to this point, a large population influx and the construction of two new bridges crossing Salinas River soon resulted in an increase of development adjacent to U.S. Highway 101. By the end of the 1950s much of the original Santa Ysabel Land Grant had been developed and eight new subdivisions were annexed by the City. Architectural styles within these subdivisions were consistent with popular designs of the time and typically consisted of Ranch- and Modern-style homes. Agricultural lands east of Salinas River continued to be subdivided and annexed in the following decade, with another six subdivisions added between 1960 and 1969. Development since this time has remained largely focused on the areas bordering Salinas River and the highway, with areas further to the east continuing to be characterized by agricultural uses.

3.2.4.2 AGRICULTURAL DEVELOPMENT

City of Paso Robles Historic Resources Survey (Historic Resources Group 2010) provides a thorough discussion of the significant role of agriculture and wine grape cultivation in the Paso Robles area and is excerpted below:

> *Agriculture is the main commercial enterprise in San Luis Obispo County, and is critical to the economy and development of Paso Robles. During the late nineteenth century dairy, cattle, and horse ranches were established in the region. The most significant crops during this period were the grain crops, primarily wheat and barley. Paso Robles became the commercial capital of a regional economy based on the export of wheat in the 1880s and 1890s.*
>
> *The goal for many farmers, however, was to slowly increase the size of their orchards and eventually replace wheat altogether. The long-term attraction of orchard crops was their much higher profit yields, as one acre of fruit will yield more profit than fifteen acres of wheat." They were successful in this venture, and between 1870 and 1910 California agriculture underwent a momentous transition in which specialty crops (primarily fruits, nuts, raisins, and wine grapes) completely eclipsed grain production. The transition required time and money since fruit trees usually do not come into full bearing until four or five years after planting. In the interim, wheat provided income enabling farmers to support their families and nurture their trees. In addition, the local infrastructure needed to adapt to the new requirements of orchard farming, including the necessity for professional nurseries, driers, and canneries.*
>
> *During this period, the almond began to emerge as one of the most successful orchard products for Paso Robles. The mixture of sand, clay, and silt in the soil provided good drainage, and the average rainfall of the area created the ideal climate for non-irrigated almond orchards. Michael Gerst, a prominent Paso Robles pioneer, was a homesteader on land subdivided near the rail lines in the 1880s in the Oak Flat district west of Paso Robles. He established several acres of fruit and nut orchards. The almond grew so successfully for him that at the 1906 World's Fair Gerst took the prize for "the best almonds in the world." In the 1920s Paso Robles would become the "Almond Capitol," having the largest concentration of almond orchards in the country…*
>
> *… The economic growth of the 1870s and 1880s led first to the establishment of the Grange, which was the country's first nationwide agricultural organization and was based on the principles of fraternal institutions. In addition, the related ideals of the Scandinavian Folk School Movement, which was transplanted to the United States by Norwegian, Swedish, and especially Danish immigrants who settled in the Midwest and along the Pacific Coast during the second half of the nineteenth century, was also influential in cooperative ideals taking hold in the region. From grass roots societies such as the Grange, the Farmer's Alliance Business Association organization emerged in 1891 and began actively marketing collective farming. In the Paso Robles area, a large Nordic influx during the 1870s and 1880s formed a third of the founders and stakeholders in the Farmers Alliance Business Association. The flourishing agricultural industry and ancillary businesses needed to support its growth gave the Farmers Alliance a strong foothold in Paso Robles.*
>
> *In the 1890s the Southern Pacific Railroad had established a four-way monopoly controlling commercial transportation, grain milling, grain warehousing and the local lumber supply. This monopoly allowed the Southern Pacific to demand that towns and*

cities who wanted rail connections absorb the costs of construction by providing cash subsidies, granting access to rights-of-way, and donating the land for railroad depots. In Paso Robles, a man named Richard Shackelford controlled railroad enterprises.

In 1891 Alliance members from San Luis Obispo and Monterey counties gathered to lay the foundation for a new cooperative flourmill to compete with the monopoly of the Southern Pacific Milling Company. They voted to unite and go into the grain warehousing business, founding the Farmers Alliance Business Association (FABA), which was formally incorporated on June 20, 1891. They purchased land from Daniel Blackburn and developed a site that fronted the Southern Pacific tracks. Richard Shackelford declared that the sidetrack facing the warehouse could only be used by the Southern Pacific Milling Company and any movement across the property would be treated as trespassing. This claim was refuted by the newly formed California State Railroad Commission, and FABA was able to firmly establish a tradition of a supportive agricultural cooperation in California.

With this foundation, The Farmers' Alliance Business Association continued to influence economic agricultural practices in Paso Robles. Although the political Populists Movement born from the Farmer's Alliance died out in 1896, the Alliance cooperatives left behind an enduring legacy that influenced the local economy of the upper Salinas Valley long into the twentieth century. The endurance of FABA as a private company preserved the vital competition established by the Alliance against Southern Pacific Milling Company…

With the United States entrance into World War I in 1917, there was an enormous demand for agricultural products, which proved an economic boon to Central California. During the War, many farmers turned to the production of navy beans, since these were subsidized by the War Relief Administration. Before reliable refrigeration, beans could be shipped to the troops in Europe without spoiling, and San Louis Obispo County's economy boomed. The Hot Springs Hotel was the center of local fundraising efforts to support the War Effort.

When the war was over in 1918 these government subsidies ended, and area farmers turned again to dairy and produce. The steep decline in demand as European countries started to recover and produce their own supplies laid the groundwork for a depressed economy in the late teens and early 1920s. American farmers, who represented one-quarter of the economy, had expanded their output during World War I, when demand for farm goods was high and production in Europe was cut sharply. After the war, farmers found themselves competing in an oversupplied international market. Prices fell, and farmers were often unable to sell their products for a profit…

Advertisements placed in publications such as Sunset Magazine claimed that almonds would make the reader "independent for life," and trips aboard the Southern Pacific to attract out-of-town potential orchardists were arranged. From the mid teens through 1922, the Paso Robles Press dedicated a front page article of every issue to the Almond Growers Association. The Chamber of Commerce named its newsletter "The Nutcracker," with the promotional text claiming Paso Robles as the "largest almond growing district in the world…"

Agriculture continued to play an important role in the expansion of Paso Robles during this period. In the 1940s, the local company of Jackson & Reinhart began to take over thousands of acres formerly managed by the Paso Robles Almond Growers Association.

From 1950 to the late 1960s, Paso Robles produced 90 percent of the almonds sold in the nation. By the 1960s, however, California's water project brought large supplies of water to the San Joaquin and Sacramento Valleys. Land that previously lacked water to grow almonds was put into production. The area's main almond processing plant moved its operation to the San Joaquin Valley and the Paso Robles Almond Growers Association faded.

Viticulture in Paso Robles

The other major agricultural product that had a profound influence on the development of Paso Robles and the surrounding area were wine grapes. In 1858 a French Army "soldier of fortune" named Pierre Hippolyte Dallidet settled in San Luis Obispo. He built an adobe home on the grounds of the Mission San Luis Obispo and he purchased the failing vines of the Mission San Miguel Arcangel. He is credited with revitalizing the wine industry in San Luis Obispo County that had begun during the Mission era.

Many other local farmers followed Dallidet's example, including Indiana rancher Andrew York, who began planting vineyards on his 240-acre homestead in 1882. Within a few years, he found that the vines were yielding more than he could market, prompting him to establish Ascension Winery, known today as York Mountain Winery. The family planted some of the area's earliest Zinfandel vines, making Paso Robles famous for this variety. York initially sold his wines in San Luis Obispo and eventually as far away as San Francisco. Today, York Mountain Winery is the oldest winery in continuous operation in the county…

Under growing pressure from religious and political temperance movements, the 18th Amendment to the Constitution was enacted in 1920 prohibiting the sale, manufacture, and transport of alcohol in the United States; Prohibition lasted until 1933 when it was repealed by Franklin Delano Roosevelt. The California wine industry certainly suffered during this period, but at the same time, there was an influx of immigrants to the area who were willing to establish new vineyards.[1]

The most famous new vintner during this period was Ignace Paderewski, who purchased 2,000 acres of land for farming, and in the early 1920s planted Petite Sirah and Zinfandel on his Rancho San Ignacio vineyard. More than any other variety, Zinfandel had a strong influence on the early growth and development of the wine industry in Paso Robles. When Prohibition ended, Paderewski's wine was made at York Mountain Winery. The wines produced from grapes grown on Rancho San Ignacio went on to become award-winning and helped grow Paso Robles' reputation as a premier wine region…

…This era [post-World War II] saw a new generation of vineyard pioneers in the Paso Robles area, bringing university training and financial resources for large plantings. Dr. Stanley Hoffman, under the guidance of U.C. Davis and legendary enologist Andre Tchelistcheff, planted some of the region's first Cabernet Sauvignon, Pinot Noir and Chardonnay on his 1,200-acre ranch next to the old Paderewski Ranch in the hills of

[1] The California wine industry was aided by two loopholes in the Prohibition law: 1) sacramental wine was exempt with government permit and 2) the sale of fresh and dried grapes was exempt. The latter loophole was particularly complex because sellers and buyers could be charged with conspiracy if it was known that the grapes would be turned into wine. Additionally, vintners produced "wine bricks" made of concentrated grape juice for people to then dissolve. The bricks came with warnings stating that they were not meant for alcoholic consumption and if stored in a cool place for 21 days would result in wine (Burnham 2010; Blakemore 2015).

Adelaida, about five miles west of town. His Hoffman Mountain Ranch Winery (a portion now owned by Adelaida Cellars) was the first large-scale modern facility in the area.

New wine grape growers also began to cultivate the first large plantings on the east side of the Salinas River. Bob Young planted the area's first large scale commercial vineyard, now known as Rancho Dos Amigos on Shandon Heights. Herman Schwartz, managing partner for a group of investors, planted the 500-acre Rancho Tierra Rejada in 1973. From 1973 to 1977 Gary Eberle and Cliff Giacobine planted 700 acres, including the first modern commercial acreage of Syrah in the state and established Estrella River Winery, the largest winery in the area (purchased in 1988 by Nestle/Beringer).

Large vineyards and wineries continued to be established in Paso Robles through the 1980s and 1990s, as growers recognized that favorable soil and climate conditions, combined with reasonably priced and available land, allowed them to grow high-quality wine grapes at more competitive price levels than was possible in other areas.

3.2.4.3 ELECTRIC GENERATION AND TRANSMISSION IN PASO ROBLES

Presented below is an excerpted history of electric generation and transmission in California from "Guide to Evaluating Electric Transmission Structures for the National Register of Historic Places" (Adams 2010), followed by a discussion of this theme as it relates to San Luis Obispo County:

It was in 1879 when Thomas Alva Edison invented the incandescent light bulb, that electric transmission began its next great set of developments in modern history. Edison contributed to the development of new systems of power generation and distribution which initiated the development of the electric utility industry.

After Edison invented the light bulb, the 1880's saw a splurge of electric utility companies develop in California. Edison's Read Street Station began operating in 1882. Most of these electric utility companies used low-voltage direct current (D.C.) dynamos which could only transmit electricity about three miles. Since the transmission distance was not too great, only urban areas where populations were dense could economically be served by these early companies. The California Electric Light Company from San Francisco was the first to begin running long distance electric transmission lines in California starting in 1879. The California Electric Light Company had difficulty with their long distance lines because the D.C. system only allowed for short transmission. Nikola Tesla and William Stanley were the first to develop an alternating current (A.C.) for electric lighting. The A.C. system allowed higher voltages of electricity to be transmitted through the line than the D.C. system could handle. In 1890, four California cities; Santa Barbara, Visalia, Pasadena, and Highgrove, began to use this new technology in their power plants. Also introduced was the "converter," now called a transformer. The transformer reduced the high distribution voltage from the transmission line to a lower voltage to be used in houses with interior wiring.

The 1890's saw even greater advancements in electric transmission. The San Antonia Light and Power Company began using an oil-filled "step-up" transformer. The "step-up" transformer was created 1892 by Almarian William Decker and was used to convey 10,000 volts of A.C. current about fourteen miles from San Antonio Canyon to Pomona. Before Decker's invention, 1,000 volts was the largest voltage that lines could transmit. Shortly after this fourteen-mile line, a twenty-eight mile line was built by the same company and extended from San Antonio Canyon to San Bernardino. In 1899, the Edison Electric

Company built the longest line to date, an eighty-three mile transmission line from the Santa Ana River to Los Angeles. They were able to achieve the extraordinary lengths by using glazed porcelain insulators which could handle up to 40,000 volts of electricity. The length of transmission lines only continued to expand into the 20th century. Bay Counties Power Company built a 142 mile long transmission line in 1901 which brought power from the Colgate Powerhouse in the Sierra Nevada to Oakland. They used cedar poles as the structure support which held copper and aluminum wires. This transmission line was even more impressive by the 4,427 foot expansion it made crossing the Carquinez Straits. The construction engineer responsible for the project was John Debo Galloway. Galloway is given credit for designing and constructing the cable span which was the longest in the world at the time. Galloway's transmission line was also the first electrical power produced in the Sierra Nevada and crossed the mountains into the Sacramento Valley. The power from this transmission line was then used by Bay Area residents. Galloway lived from 1869-1943 and is recognized as one of the major pioneers in the design of electric transmission facilities, lines, and towers in California.

The hydroelectric industry of the early 20th century was a major contributor to the development of electric transmission in California. Between 1900 and 1910 California's population increased by 60 per cent and with that expansion came the high demand for electricity. California's first hydroelectric plant was the Folsom Powerhouse on the American River in Sacramento County which began service in 1895. From this period until the end of World War II, hydroelectric systems evolved heavily in design and engineering. Hydroelectric companies in California provided a network of long distance electric transmission lines. The Bay Counties Power Company and the Standard Electric Company in 1902 had nearly complete electric coverage of the Bay Area and places like Stockton, Amador City, and Marysville.

The Edison Electric Company built a 118 mile long transmission line in 1907. This transmission line carried 75,000 volts to Los Angeles from the Kern River No. 1 hydroelectric plant. This transmission line system was the first line to use steel towers as the supporting structure. The towers were built by the Wind Engine Company which was a windmill manufacturer.

Some of the largest and most significant hydroelectric projects in California started in the late 1920s. The Big Creek Hydroelectric System is owned by the Southern California Edison Company. The Central Valley Project is owned by the federal government but was conceptualized by the State of California. The Big Creek Hydroelectric system, in 1929, generated a total of 424,500 kw operating across 36 miles of tunnels; a huge project in California during that time in hydro engineering. The project employed John Eastwood, a pioneer in dam engineering and design, for a number of years during the project. The Central Valley Project was one of the largest water conveyance projects ever undertaken. It was constructed as a reaction to the growing state of California's population including water and electricity needs. The CVP originally consisted of five central units; Shasta Dam, Delta-Mendota Canal, Friant Dam, Friant-Kern Canal, and the Contra Costa Canal. The main operation of these units was to deliver Sacramento River Water from the north of California to the dry San Joaquin Valley. It now operates over 11 divisions/units across California. The Nevada Irrigation District (NID) began the Yuba-Bear river project in 1963, harnessing the Yuba and Bear rivers. PG&E partnered with NID on the Yuba-Bear river hydroelectric project which now provides enough electricity to power 60,000 homes. Today, Southern California Edison Company and PG&E own and operate a large share of hydroelectric systems in California. The Central Valley Project, owned by the Bureau

> *of Reclamation, is still the largest multi-purpose hydroelectric project in California. PG&E currently owns and operates nearly 500 miles of hydroelectric systems throughout California with a generating capacity of 3,896 megawatts powering over 4 million homes. In recent decades electric companies throughout California, led by industry giants PG&E and Southern California Edison Company, continue to expand their electric transmission systems to reach further and provide greater energy than ever before.*

3.2.4.4 ELECTRIC GENERATION AND TRANSMISSION IN SAN LUIS OBISPO COUNTY

The history of electric power in San Luis Obispo County coincides closely with the early days of the new power source. Constructed in 1883, the first electric plant in San Luis Obispo arrived just 4 years after California's electric history began with the establishment of the California Electric Light Company in San Francisco in 1879 (Pacific Gas and Electric Company 1954). The San Luis Obispo plant was developed by the San Luis Obispo Gas and Electric Company and consisted of a small, steam engine-powered dynamo that was primarily used to light carbon-arc street lights. Other plants soon followed, including the Santa Maria Electric and Gas Company in Santa Maria, the Russell Robinson Electric Company in Arroyo Grande, and the Paso Robles Light and Water Company in Paso Robles.

The "modern" electrical history of the Central Coast region began in 1913 when Emory and Albert Graves Wishon organized the Midland Counties Public Service Corporation. The new enterprise soon purchased many of the existing small electric systems in the area, including the operation in Paso Robles. Other acquisitions in the following years expanded the company's service into Fresno, Monterey, and Santa Barbara Counties (Walker 1919:168). Although the company initially relied on the generation capabilities of the small systems it acquired, increased demand soon led the company to purchase electrical energy from the San Joaquin Light and Power Corporation. By 1917, electricity was being conveyed to the Central Coast over a 137-mile, 60 kV transmission line that ran from the San Joaquin Light and Power Corporation's Henrietta Substation in Kings County, through Coalinga, San Miguel, Paso Robles, and San Luis Obispo to Santa Maria in Santa Barbara County (Railroad Commission of the State of California 1917:322).

As electricity became commonplace in homes across California in the 1920s, the need for additional systems grew with it. In order to provide the Midland Counties Public Service Corporation with more energy, the San Joaquin Light and Power Corporation developed additional transmission lines and substations. This included the development of additional transmission lines including new lines extending to smaller communities such as Guadalupe, as well as the expansion of substations in McKittrick and Santa Maria (*Electrical West* 1922:417). Other expansions in San Luis Obispo County during this period included new lines to Morro Bay, Cayucos, Cambria, and eventually Shandon, Cholame, and Parkfield.

Many of the early steam plants were retired by the 1920s and in the following decades, the Central Coast region increasingly received its energy from generation plants to the east operated by the San Joaquin Light and Power Corporation. Local energy production eventually returned to the region with the development of the 300,000-kilowatt Morro Bay steam plant in the 1950s, by which time the Midland Counties Public Service Corporation was acquired by Pacific Gas and Electric (Pacific Gas and Electric Company 1954; Williams 1997:292). This new plant resulted in the construction of new high voltage power lines that delivered electricity to the local communities, and with the subsequent development of the Gates substation in Fresno County reversed the historic trend by transmitting power back to the San Joaquin Valley.

4 NATIVE AMERICAN COORDINATION

As part of the effort to identify indigenous cultural resources within the study area, NAHC was contacted to search the Sacred Lands Files on April 5, 2016. On June 27, 2016, letters were sent to two contacts

NAHC identified as possibly having knowledge of cultural resources within the study area. The letters requested any available information on resources in the project vicinity and invited general commentary or questions pertaining to the project. Two informal tribal outreach meetings were held on August 23, 2016. Each of the two tribes identified by NAHC (the Salinan Tribe of Monterey and San Luis Obispo Counties and the Xolon-Salinan Tribe) requested a separate meeting with representatives from the project proponents.

Patti Dunton of the Salinan Tribe of Monterey and San Luis Obispo Counties expressed concerns over the general sensitivity of the Santa Ysabel Ranch area, which is outside of the study area. She also stated that the tribe would further review the information that they had been provided.

The Xolon-Salinan Tribe indicated that their ancestors had used Dry Creek as a transportation corridor. They also indicated that the areas surrounding the Estrella and Salinas Rivers were sensitive for cultural resources. Details regarding Native American outreach are included in Table 1 and in Appendix A.

Table 1. Native American Coordination Summary

Xolon-Salinan Tribe Karen White, Council Chairperson PO Box 7045 Spreckels, CA 93962 Salinan blukat41@yahoo.com 831-238-1488	06/27/2016: by U.S. Mail and email	The proponents had a teleconference with Xolon-Salinan Tribe representatives (Karen White, Council Chair, and Donna Haro, Tribal Headwoman) and their Cultural Resources Consultant (Karen Fontanetta) on 8/23/2016.

5 METHODOLOGY

5.1 Records Search

On September 8, 2015, cultural resources specialists requested a search of the California Historical Resources Information System (CHRIS) from the Central Coast Information Center (CCIC), located at University of California, Santa Barbara. The CCIC provided the results on September 10, 2015, and copies of relevant study reports were received on April 12, 2016. The records search included any previously recorded cultural resources and investigations within the records search area, defined as within 1 mile of the ASA. The CHRIS search also included a review of the NRHP, the CRHR, the California Points of Historical Interest list, the California State Historical Landmarks list, the Archaeological Determinations of Eligibility list, the Historic Properties Directory, the Archaeological Determinations of Eligibility List,

the California Inventory of Historic Resources, the California Department of Transportation Bridge Survey, and local historic resources inventories.

5.2 Additional Background Research

Cultural resources specialists conducted additional background research to identify potential cultural resources within the ASA prior to survey, and to better understand the nature and context of cultural resources identified as a result of the survey. Researchers consulted historical USGS topographic maps (1919, 1952, 1966), General Land Office survey plats (1869), historical aerial photography (NETR Online 2016; Google 2016), Sanborn Fire Insurance Company maps, and soil survey data (SoilWeb 2016). The *City of Paso Robles Historic Resources Survey* (Historic Resources Group 2010) and the *Paso Robles Historic Resources Inventory* (Historic Resources Group 2014) provided information relating to local historical context. Additional background research was conducted to identify relevant primary and secondary source materials relating to the construction and developmental history of historic-age built environment resources located within the BESA. Repositories and other sources consulted include records on file with the County Assessor, the History Center of San Luis Obispo in San Luis Obispo, and the South County Historical Society in Arroyo Grande.

5.3 Buried Site Sensitivity Study

In order to assess the potential of Estrella Substation to contain subsurface cultural deposits, a geoarchaeologist conducted a geoarchaeological desktop analysis by consulting a combination of aerial imagery, Natural Resources Conservation Service (NRCS) soils data (SoilWeb 2016), and geologic maps and reports available for the area (Dibblee and Minch 2004; Durham 1974). Buried site sensitivity was assessed largely on the basis of landform type, depositional regime, and age of geologic surfaces as inferred from the above sources. No field-based geoarchaeological testing was conducted at this time.

5.4 Archaeological Survey

Archaeologists conducted an intensive pedestrian survey of the ASA on March 3, March 8, and May 16, 2016. The intensive-level survey consisted of systematic surface inspection with transects walked at 15-meter (m) (50-foot) intervals or less to ensure that all surface-exposed artifacts and sites in the ASA could be identified. Archaeologists examined the ground surface for the presence of prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools), historical artifacts (e.g., metal, glass, ceramics), sediment discoloration that might indicate the presence of a cultural midden, roads and trails, and depressions and other features that might indicate the former presence of structures or buildings (e.g., post holes, foundations).

Whenever cultural resources were encountered, archaeologists collected all data necessary to complete the appropriate California Department of Parks and Recreation (DPR) 523 series forms. Resources were mapped with handheld mapping-grade Trimble Geo7X and GeoXT Global Positioning System (GPS) units with sub-meter accuracy and differential correction. Field GPS data for sites were post-processed using Trimble Pathfinder Office software and projected into Universal Transverse Mercator, Zone 10 North, North American Datum 1983 coordinates. All GPS data were exported into Geographic Information Systems (GIS) geodatabases and plotted onto the associated geo-referenced USGS 7.5-minute quadrangle to ensure accuracy and to produce location maps of all resources. In addition to mapping, cultural resources specialists documented all resources with overview photographs. Archaeologists assigned temporary field numbers using the provenience designation (PD) system, beginning with PD1001. No artifacts were collected during the surveys.

5.5 Built Environment Survey

Field staff photo-documented potential historic-era architectural resources within the Steinbeck Vineyards winery on March 25, 2016. Due to access restrictions, architectural historians were not able to survey potential historical architectural resources outside the Steinbeck property and the public right-of-way. Where access was not possible, researchers relied on the results of the desktop review to determine properties' ages. After the desktop review, architectural historians followed up with a field survey of potential built environment historical resources on May 16, 2016. Background research for the BESA consisted of research into the history of the properties within the BESA, including review of County Assessor's records, historical maps, and historical aerial photography.

6 RESULTS

6.1 Records Search

The CCIC conducted an initial records search on September 10, 2015, and a follow-up records search on April 5, 2016. The records search included any previously recorded cultural resources and investigations within the records search area, defined as within 1 mile of the ASA. Records search materials from the CCIC are provided in Appendices B and C.

6.1.1 Previously Conducted Cultural Resource Studies

Results of the cultural resources records searches indicate that 12 previous cultural resource studies have been conducted within 1 mile of Estrella Substation. No previous studies have been conducted within the Study Area. Details pertaining to these investigations are presented in Table 2.

Table 2. Prior Cultural Resource Studies within the Records Search Area

6.1.2 Previously Recorded Cultural Resources

The CCIC records search results identified two previously recorded cultural resources within 1 mile of Estrella Substation. Details pertaining to these cultural resources are presented in Table 3. The two previously recorded cultural resources are P-40-038059, an isolated sandstone mortar found 30–60 centimeters (cm) (1–2 feet) below surface during grading, and P-40-038060, an isolated tan banded Monterey chert biface observed on the surface. Both isolates are approximately 0.75 mile away from the Study Area. The CCIC did not identify any previously recorded cultural resources within the Study Area.

Table 3. Previously Recorded Cultural Resources within the Records Search Area

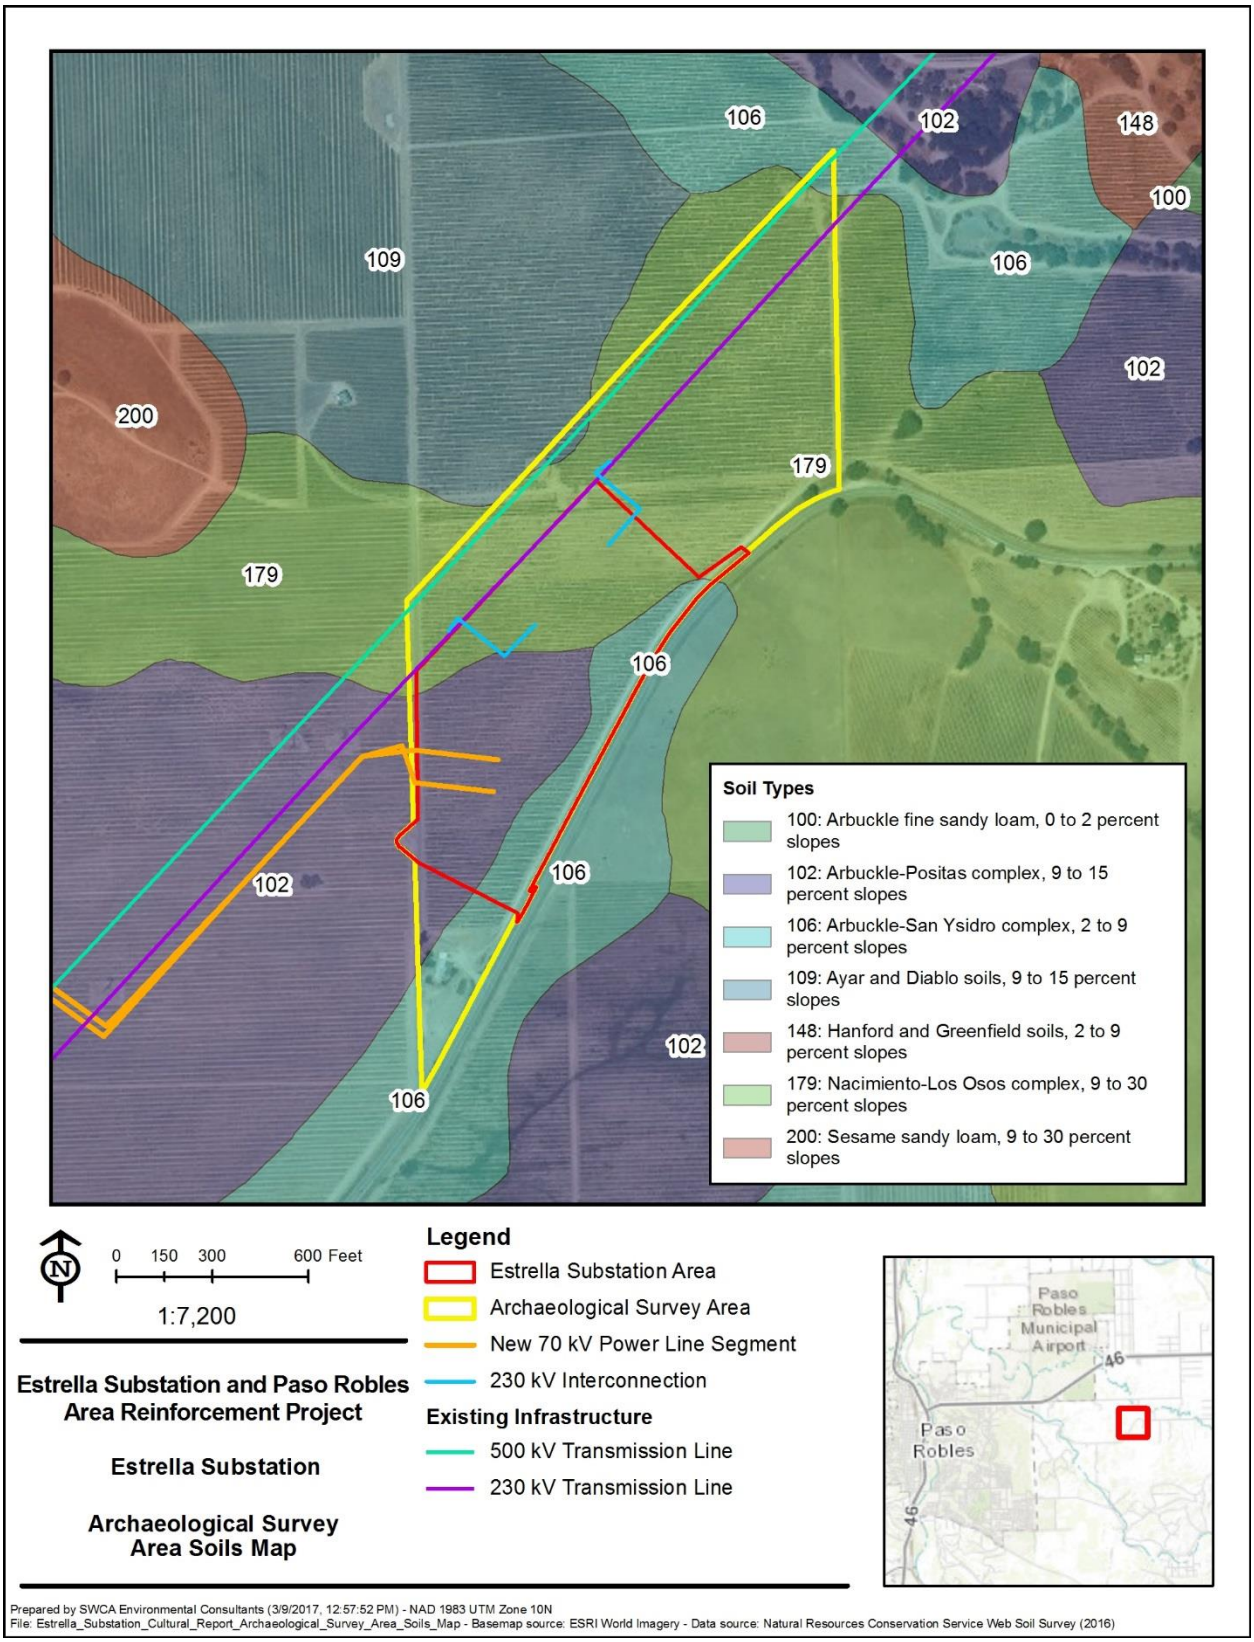
Primary Number	Trinomial	Type	Resource Description	CRHR/ NRHP/ SHL Eligibility Status	Recorded By and Year	Proximity to Study Area	Proximity to Estrella Substation Area
P-40-038059	CA-SLO-ISO-59	Prehistoric isolate	Sandstone mortar	Unknown	Gibson and Casas (1993a)	Outside	Outside
P-40-038060	CA-SLO-ISO-60	Prehistoric isolate	Monterey chert biface	Unknown	Gibson and Casas (1993b)	Outside	Outside

6.2 Buried Site Sensitivity Study

The project substation site is situated in the southern Salinas Valley, located within the Salinas River drainage basin. Estrella Substation sits approximately 4.5 miles east of the northwesterly flowing Salinas River and 3.6 miles south-southwest of the meandering Estrella River. A roughly northwest trending tributary of Salinas River, Dry Canyon runs adjacent to the northeastern corner of Estrella Substation. Site soils and buried site sensitivity are depicted in Figures 4 and 5.

The ASA is underlain by weakly indurated Pliocene and Pleistocene valley fill belonging to the Paso Robles formation, an extensive stratigraphic unit that originally covered most of the southern Salinas Valley area (Dibblee and Minch 2004; Durham 1974:54). The Paso Robles formation, which accumulated as a result of fluvial and lacustrine deposition following the recession of a large Tertiary sea, is composed mainly of sandstone and conglomerate, with some mudstone, shale, and limestone also present (Durham 1974:54–58). According to a geologic map of the Estrella quadrangle, a small amount of Quaternary streambed alluvium may also be present in the easternmost portion of the ASA adjacent to the Dry Canyon channel. Valley and stream channel alluvium in the southern Salinas Valley consists of sand and gravel dating to the Holocene (Dibblee and Minch 2004).

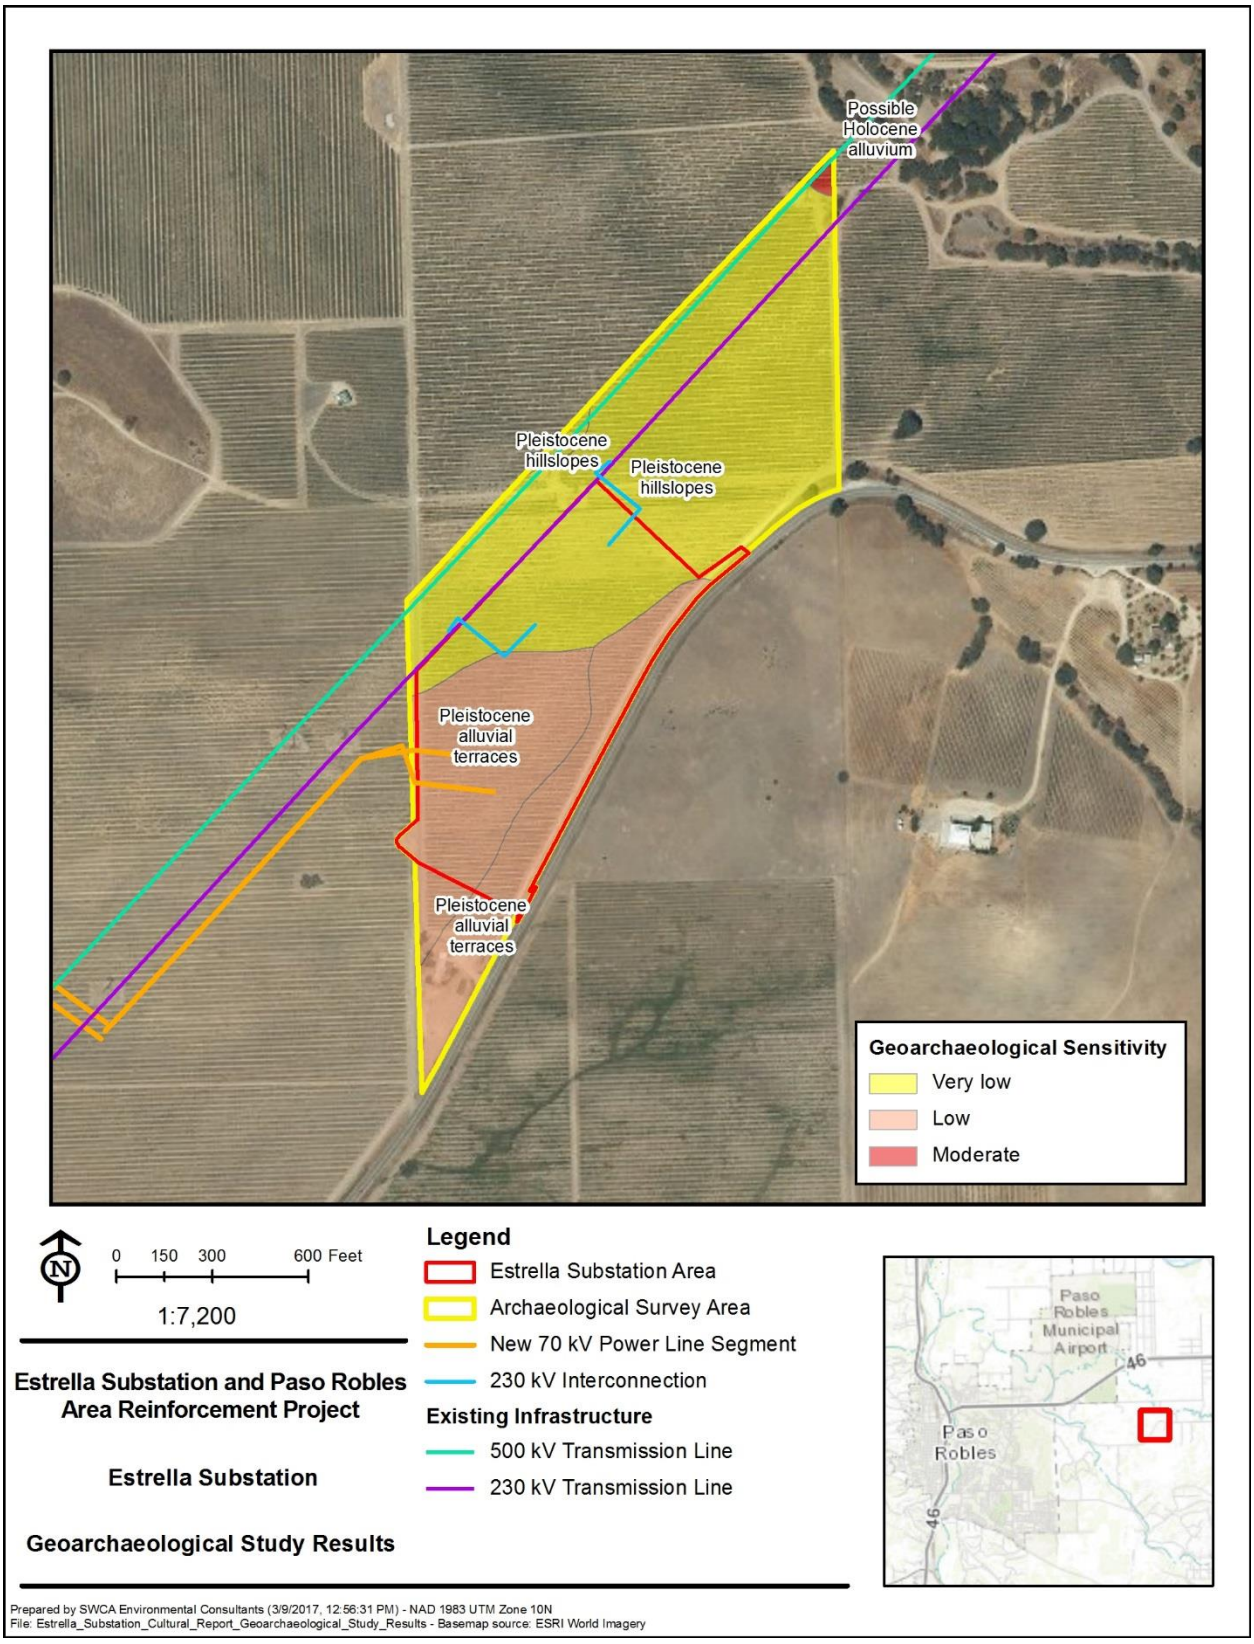
ASA geomorphology can be classified into two distinct groups on the basis of landform-sediment assemblages: 1) alluvial terraces composed of coarse to fine sandy loam and sandy clay loam deposits, and 2) hillslopes composed of residual silty clay sediments underlain by weathered shale and sandstone bedrock. Terrace surfaces dominate the southwestern portion and northeastern corner of the ASA; the remainder of the ASA is composed of hillslope components. Soils in the ASA vary based on landform association; terrace surfaces contain alfisol soils belonging primarily to the Arbuckle-Positas and Arbuckle-San Ysidro Complexes, while hillslopes are characterized by vertisols and mollisols of the Nacimiento-Los Osos and Ayar and Diablo Complexes (SoilWeb 2016).



Based on soils data and geologic maps of the southern Salinas Valley, land surfaces within the ASA are primarily Pliocene/Pleistocene in age, and therefore pre-date human occupation in the region. Due to the lack of mapped evidence for significant Holocene-aged sedimentary deposits in the ASA, landforms have low potential to contain deeply buried, intact, subsurface cultural materials. However, individual artifacts may have become shallowly buried as a result of post-depositional factors such as agricultural tilling and bioturbation. There is also potential for shallow burial of artifacts within thinly veneered sheetwash deposits that have accumulated on low-lying terrace surfaces over the course of the Holocene; however, if present, these deposits are expected to be shallow and discontinuous. Buried sites are least likely to occur on

hillslope components, which contain very shallow residual deposits measuring no more than 30 inches thick (SoilWeb 2016).

The only exception to the overall low geoarchaeological sensitivity occurs at the northeastern margin of the ASA, where there is potential for recent deposition of Quaternary alluvium resulting from overbank flooding along the Dry Canyon channel. If present, Holocene-aged overbank deposits would have high potential to contain subsurface archaeological sites due to the rapid rate of sedimentary deposition and burial. Additional testing would be required to verify the presence or absence of overbank flood deposits within the ASA.



In summary, most of the ASA, including the disturbance footprint, has low potential to contain buried archaeological sites. The northeastern corner of the ASA has moderate sensitivity for buried archaeological resources due to possible overbank alluvial deposits adjacent to the Dry Canyon channel.

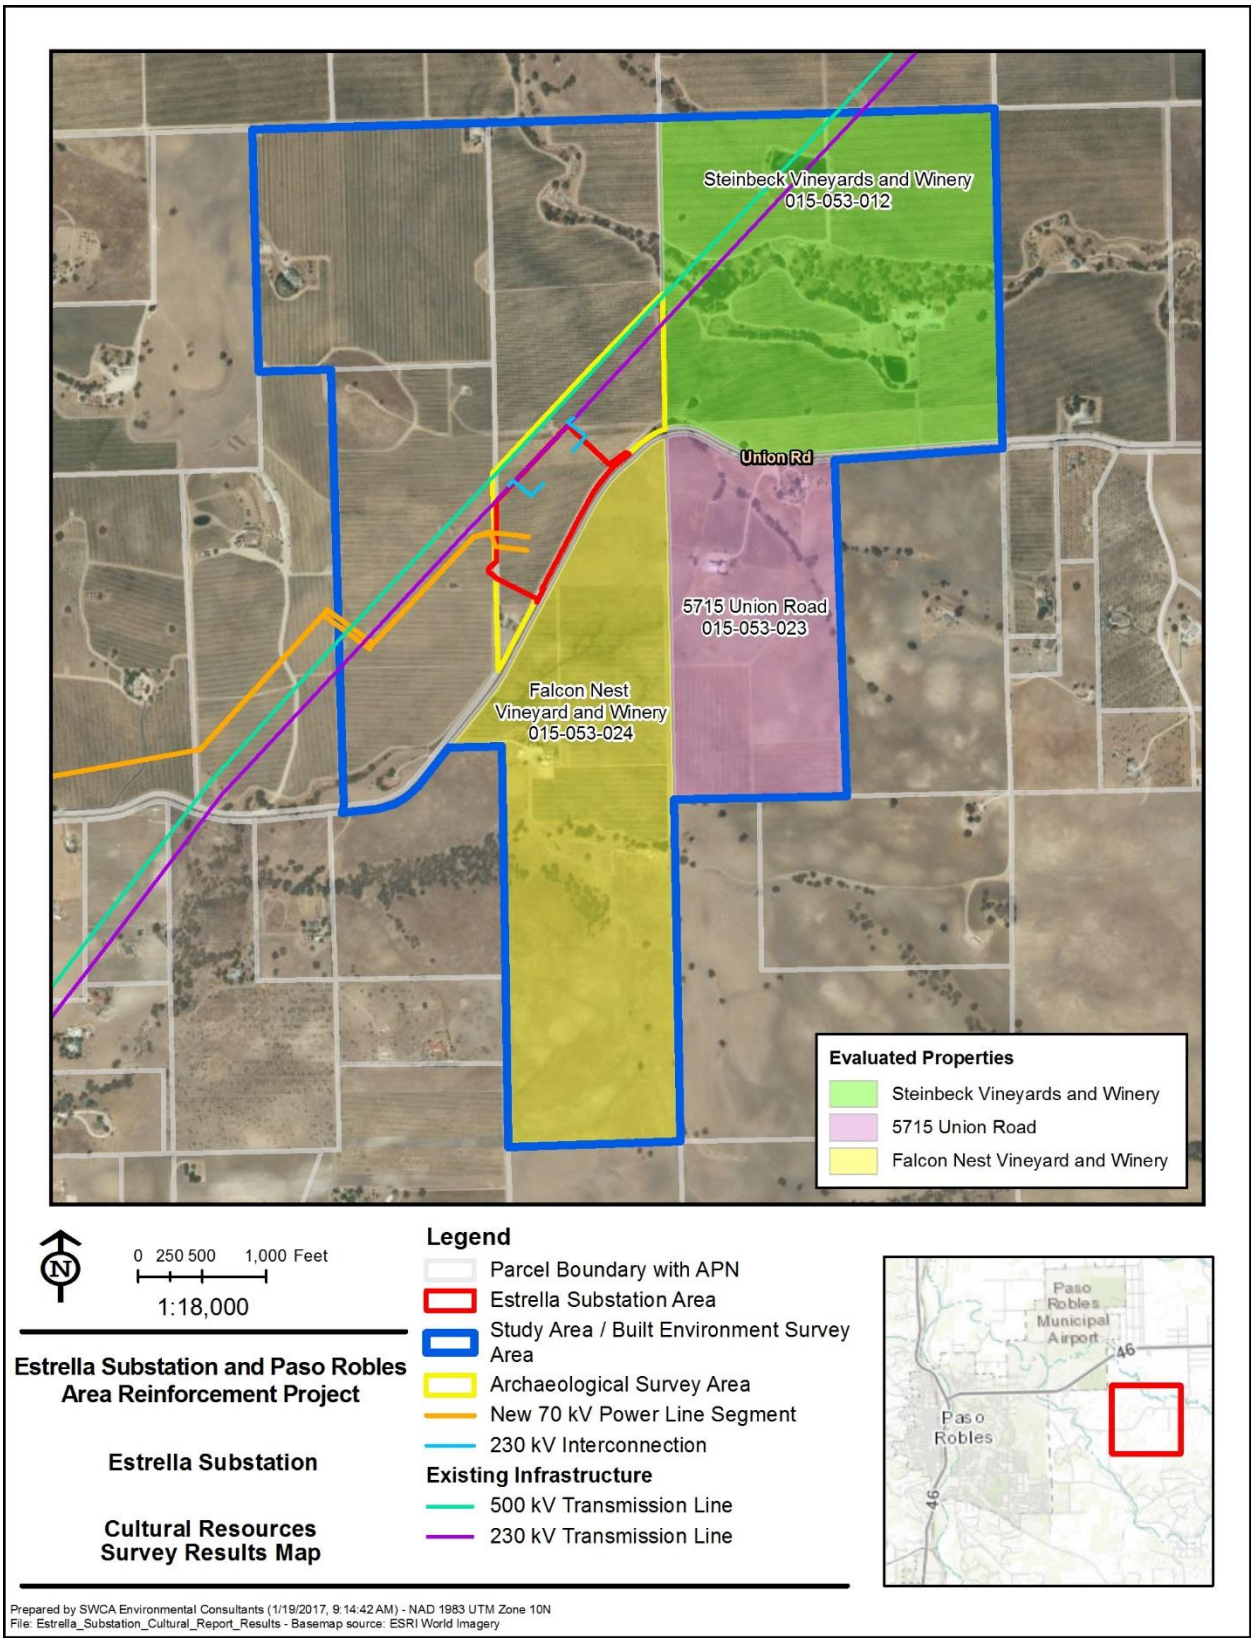
Figure 4. Archaeological Survey Area Soils Map

Soils data from the USDA Natural Resources Conservation Service.

Figure 5. Geoarchaeological Study Results

6.3 Archaeological Survey

Archaeologists conducted intensive pedestrian archaeological survey of the approximately 35-acre ASA. No archaeological resources were identified in the course of the intensive pedestrian survey. Terrain within the ASA consists of moderately steep rolling terrain with slopes of 0–30 percent. Vegetation cover was planted vineyards, recently disked fields, low annual grasses, and oak woodland in riparian zones. Ground surface visibility was variable but generally moderate to poor, ranging from less than 5 percent in undisturbed, highly vegetated areas to over 90 percent in unpaved roadways and disturbed areas that have been cleared of vegetation. Planted vineyard lands had an average ground surface visibility of 40–50 percent.



6.4 Historical Built Environment Resources

Architectural historians identified five historical built environment resources (including buildings, structures, or objects constructed over 45 years ago) within the BESA (Table 4 and Figure 6), each of which is described in greater detail in the section below. The five resources were recorded on DPR 523 Series forms and evaluated for federal, state, and local eligibility. The complete set of DPR forms prepared for all five resources can be found in Appendix D of this report.

Table 4. Resources Recorded in the Study Area

Trinomial or Temporary Designation	Resource Type	Built Date	Description
Steinbeck Vineyards and Winery	Historic-era vineyard property	Early twentieth century	Vineyard property
Falcon Nest Vineyard and Winery	Historic-era vineyard property	Early twentieth century	Vineyard property
5715 Union Road	Historic-era agricultural property	Early twentieth century	Vineyard property
Existing 500 kV Line	Historic-era transmission line	1971	Transmission Line
Existing 230 kV Line	Historic-era transmission line	1962	Transmission Line

Figure 6. Cultural Resources Survey Results Map

6.4.1 Steinbeck Vineyards and Winery

Steinbeck Vineyards and Winery is a vineyard and winery located along Union Road in unincorporated San Luis Obispo County (Figure 7). The current operation began in 1982 and now comprises approximately 400 acres spread across four parcels. Much of this acreage was purchased and developed in the mid-1990s (including buildings and vineyards within APNs 015-053-008, 015-053-010, and 015-053-011), and as a result, the current survey and evaluation effort focuses on the original 156-acre parcel owned by the Ernst/Steinbeck families beginning in 1925 (APN 015-053-012). Included within this parcel are three buildings that date to 1921, including a residence and two outbuildings, and three additional buildings and structures that were constructed beginning in the late 1980s. All of the buildings are clustered in a small complex, which is accessed from a paved driveway that runs approximately 1,000 feet north from Union Road.

Figure 7. Steinbeck Winery residence, ca. 1925, view facing southwest.

Located immediately to the west at the end of the paved driveway is the primary residence (Figure 8). Constructed in 1925, this building has been substantially altered through multiple additions in the 1990s, resulting in its current irregular plan. One story in height, the building is capped by an intersecting side-gabled roof with asphalt shingles and has been sheathed in non-original textured stucco. It features a projecting front entry to the west and a projecting addition to the east. Various sized rectangular metal windows are used throughout the building, many of which appear to be placed within non-original window openings. These alterations have negatively affected the building's integrity of design, materials, and workmanship.

Figure 8. Steinbeck Winery residence, ca. 1925, view facing southwest.

Immediately north of the residence is the present-day tasting room, which is comprised of two adjacent barns that were constructed circa 1925 (Figure 9). These two buildings are both rectangular in plan, capped by side-gabled roofs, and sheathed in corrugated metal panels. Visual observation indicates that the buildings have been substantially altered through the creation of large openings, which contain non-original metal doors. These openings have negatively affected the buildings' integrity of design, materials, and workmanship.

Figure 9. Steinbeck Winery tasting room, view facing northeast.

East of the tasting room is a large barn that was also constructed circa 1925 (Figure 10). The barn is a timber frame building with a pitched gable room, a large central opening leading to the main bay, and smaller openings on either side of the main opening. Rafter tails are visible on the short overhanging eaves. No barn doors are present and the roof has been replaced by a standing seam aluminum roof. Attached to the western elevation is a large roof extension that provides cover outside of the main entrance, and which is supported by large timber columns. The replacement of the roof and the roof extension have negatively affected the building's integrity of design, materials, and workmanship.

Figure 10. Steinbeck Winery barn, view facing west.

East of the residence is another large agricultural building that was constructed circa 1995 (Figure 11). It features a gently sloped gable roof and is composed of standing seam aluminum. Two large metal roll-up doors are located on the northern elevation, with a single metal personnel door, a smaller roll-up door, and vinyl sliding windows located on the eastern elevation. Another utilitarian agricultural building constructed circa 1989 is located to the west of the tasting room and used as pole room (Figure 12). Rectangular in plan, the building is open on the east elevation and features a steel-frame sheathed in corrugated metal, a material that also covers the cantilevered roof that slants downward to the west. Attached to the north elevation is a small shed extension, which features a flat roof and is also constructed of corrugated metal sheets. North of the tasting room is a circa 2016 open-aired dining area that is covered by a roof structure that is constructed with large timber framing and sheathed in a corrugate metal panel roof.

The building complex is located in the southwestern quadrant of the larger agricultural property, which largely covers the original 1921 parcel, as well as the three parcels to the west that were purchased in the 1990s. Intersecting the property are a number of dirt roads as well as a dry creek, which enters the parcel near the center of the northern boundary and traverses a general southeast course through to the eastern boundary of the property. Also crossing the larger property are two lattice steel tower transmission lines, both of which were constructed circa 1960. Two open water storage ponds were constructed sometime between 1975 and 1994, one of which is located to the northwest of the building complex and another that is immediately to the south. Outside of the boundaries of the historic-era property as it was currently recorded are four residential buildings, all of which were constructed after Steinbeck purchased the western adjacent properties in 1994.

Figure 11. Steinbeck Winery large workshop, view facing southwest.

Figure 12. Steinbeck Winery storage barn, view facing southwest.

6.4.2 Falcon Nest Vineyard and Winery

Falcon Nest Vineyard and Winery is a vineyard and winery that occupies an approximately 145-acre parcel along the southern side of Union Road (Figure 13). Vineyards cover the northern half of the irregularly-shaped, sloping parcel, while the southern half is largely undeveloped. Buildings on the property were

constructed between 1962 and 2010 and are located off an unpaved dirt road that leads east from Union Road; these include a residence, tasting room, large banquet facility, an outdoor kitchen, and gazebo. The buildings primarily appear to be wood construction with corrugated metal or asphalt shingle roofs. Because access to the privately-owned property was not authorized at the time of the field survey, observations were made from the public right-of-way and through historical and current aerial photographs.

Figure 13. Falcon Nest Vineyard and Winery, view facing east.

6.4.3 5715 Union Road

5715 Union Road is an agricultural property located on a sloping 83-acre parcel, which includes two distinct building complexes. Closest to Union Road, east of an unpaved road, is a residence that was initially constructed in 1954 (Figure 14). It features an irregular plan, the result of a 1994 addition, and is capped by a complex multi-level roof that extends to cover a wrap-around porch on the northwestern corner of the house. Immediately to the northeast of the residence is a rectangular storage building with a gable roof. Southwest of the residential complex up a steeply sloped hill is a tasting room and barrel storage building, which were both constructed in 2006 (Figure 15). The tasting room is a rectangular building with an end-gable metal roof with a gable-roofed monitor. The building has a stone masonry appearance and the main entry is rounded wood double doors. A wood trellis occupies the space between the tasting room and the barrel storage building, located immediately to the west. Set perpendicular to the tasting room, the barrel storage building is a two-story rectangular metal building. Because access to the privately-owned property was not authorized at the time of the field survey, observations were made from the public right-of-way and through historical and current aerial photographs.

Figure 14. 5715 Union Road residence, view facing southeast.

Figure 15. 5715 Union Road tasting room and barrel storage building, view facing south.

6.4.4 Transmission Lines

Two PG&E electrical transmission lines are present within the BESA—a 230 kV line and a 500 kV line. The two lines run parallel to each other and are oriented approximately southwest–northeast. The 230 kV transmission line is on the southeast side of the alignment and the 500 kV transmission line is on the northwest side. Two 500 kV towers and two 250 kV towers are present within the ASA. At present, the towers are lattice steel towers (LSTs) with cylindrical concrete foundations at the base of each leg support (Figures 16–17).

Figure 16. Electrical transmission lines: Existing 230 kV (at left) and existing 500 kV (at right), view facing west.

Figure 17. Concrete leg foundation of existing 230 kV transmission tower.

6.4.4.1 EXISTING 500 KV TRANSMISSION LINE

The subject structure is a segment of PG&E's existing 500 kV transmission line. The 1.08-mile segment is within a utility corridor that follows a northeast-southwest alignment and also includes the existing 230 kV transmission line immediately to the south. The existing 500 kV transmission line was constructed circa 1971. The 500 kV tower base footprint measures approximately 20 × 60 feet. Spanning approximately 1,000 feet, the single-circuit LSTs measure approximately 100 feet in height and consist of a steel framework with structural components bolted together. The base of each LST flares outward to two legs that sit atop cylindrical concrete footings, with the upper portion of the tower supporting three phases spread across a horizontal cross arm. Providing power to the greater Fresno and San Joaquin Valley areas, the linear feature is part of a much larger segment that runs between the Diablo Power Plant to the southwest and Gates Substation to the northeast.

6.4.4.2 EXISTING 230 KV TRANSMISSION LINE

The subject structure is a segment of PG&E's existing 230 kV transmission line. The 1.14-mile segment is within a utility corridor that follows a northeast-southwest alignment and also includes the existing 500 kV transmission line immediately to the north. The existing 230 kV transmission line was constructed circa 1962. The 230 kV towers measure approximately 30 feet square at their bases. Spanning approximately 1,000 feet, the double-circuit LSTs measure approximately 120 feet in height and consist of a steel framework with structural components bolted together. The base of each LST flares outward to four legs that sit atop cylindrical concrete footings, with the upper portion of the tower supporting three vertically stacked cross arms, each of which carries a hanging insulator at each end. Providing power to the greater Fresno and San Joaquin Valley areas, the linear feature is part of a much larger segment that runs between the Morro Bay Switchyard to the west and Gates Substation to the east.

6.5 Evaluations

As discussed in the Regulatory Framework section above, and in accordance with PRC Section 5024.1(c)(1–4), a resource is considered eligible for the CRHR and *historically significant* if it: 1) retains "substantial integrity," and 2) meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region, or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

Evaluations for all identified resources within the Study Area are summarized in Table 5.

Table 5. Summary of Evaluations

Primary # or Temporary Designation	Resource Type	Intersecting Project Components	Evaluation
Steinbeck Vineyards and Winery	Historic-era vineyard property	None	Not eligible
Falcon Nest Vineyard and Winery	Historic-era vineyard property	None	Not eligible
5715 Union Road	Historic-era agricultural property	None	Not eligible
Existing 500 kV Line	Historic-era transmission line	New 70 kV Power Line Segment	Not eligible
Existing 230 kV Line	Historic-era transmission line	230 kV Interconnection	Not eligible

6.5.1 Steinbeck Vineyards and Winery

The land on which the present-day Steinbeck Vineyards and Winery sits was purchased by the Ernst family in 1921. Originally from Germany, the William Ernst family first settled in Geneseo, Illinois before responding to a newspaper article in 1884, which invited families to San Luis Obispo County to help start a Lutheran Church (Paso Robles Magazine 2013). The family eventually settled in an area they named Geneseo, located approximately 4 miles east of Paso Robles, and proceeded to grow grapes to produce their own wine. In 1921, William's son Frank and his wife, Rosetta "Rosie," purchased a portion of the land that is now Steinbeck Vineyards and Winery and constructed a residence and other agricultural-related buildings in 1925. They proceeded to use the land and other non-contiguous parcels they owned to the northwest to raise cattle and grow grain (Steinbeck 2016). Ownership of the property eventually transferred to Frank and Rosie's daughter Hazel, who returned to the Ernst Ranch with her husband George Steinbeck in 1948 (Paso

Robles Magazine 2013). A reverend, George Steinbeck was also the uncle of Nobel prize-winning author John Steinbeck, Jr.

Born in Salinas in 1902, Steinbeck Jr. does not appear to have had significant ties to the Paso Robles area during his lifetime; instead, his biographers emphasize the influence of his early experiences in and around Salinas, and on his mother's family ranch near King City (Benson 1984; Parini 1994). Hazel and George Steinbeck lived on the ranch intermittently over the following decades, and their son Howie purchased the property in 1972. Howie planted the first vineyards on the property 10 years later in 1982 as part of a partnership with Gary Eberle, in which Howie would grow the grapes and Eberle would make the wine. In the late 1980s and in 1994, Howie purchased the adjacent properties to the west, expanding the total acreage to the current 520 acres (Paso Robles Magazine 2013; Steinbeck 2016). After Howie's daughter Cindy Steinbeck returned to the area in 1997, she persuaded her father into helping to create the Steinbeck Vineyards and Winery in 2003, which has continued to operate since this time.

The Steinbeck Vineyards and Winery does not appear eligible for listing in the CRHR under any applicable criteria. In considering the historical significance of the property, it is an agricultural property that was first developed in 1921 for cattle and grain production by Frank and Rosie Ernst, whose family began cultivating wine grapes in San Luis Obispo County in the 1880s. Although the property is associated with the early-twentieth century agricultural development of San Luis Obispo County, the 1920s residence, barn, and present-day tasting room have been substantially altered and no longer retain integrity of design, materials, or workmanship. In addition, other parcels that were owned by Frank and Rosie Ernst during the 1920s, and which were also used for grazing and farming, have since been sold, negatively affecting the property's integrity of association. As a result, the property does not retain sufficient integrity to convey any potential significance for its associations with early-twentieth century agriculture in San Luis Obispo County. Further, the property is not associated with the rise of wine grape cultivation in the area as grapes were not cultivated on the property until 1982. The property therefore does not appear eligible under Criterion 1 for its associations with significant events or under Criterion 3 as a representation of agricultural design/construction. The property is associated with the Ernst Family; however, it was not the first property owned by the family, who first arrived in the area approximately 35 years prior to the purchase of the subject property. Although the property was owned by the uncle of Nobel prize-winning author John Steinbeck, Jr., the author does not appear to have significant associations with the subject property and it does not appear eligible under Criterion 2 for its associations with important individuals. No evidence was identified to suggest that the property has the potential to yield significant information and it therefore does not appear eligible under Criterion 4.

6.5.2 Falcon Nest Vineyard and Winery

A 1919 USGS topographic map indicates that a building was located on the present-day Falcon Nest Vineyard and Winery property, just east of the current building complex (USGS 1919). The parcel boundaries at this time varied from their current configuration and a historic township and range map of the greater Paso Robles area indicates that as of 1921 the land that now encompasses the Falcon Nest Vineyard and Winery was included in two larger parcels with different boundaries than are currently present. A smaller portion to the north was included in a parcel owned by A. Wolf et. al, while the larger area to the south was part of a parcel owned by W. Smith (Paso Robles Township and Range Map 1921). As of 1937, historic aerials identify a small grouping of buildings in the proximity of the current building complex, with the surrounding land either undeveloped or being used for grazing (Environmental Data Resources [EDR] 2016). Ownership of the property transferred to Ethelyn Bermingham in 1956 and, prior to selling it 6 years later in 1962, she demolished the small groupings buildings and constructed the current residence (San Luis Obispo County Clerk-Recorder 2016a). The surrounding land appears to have continued to be used for agricultural purposes throughout this time and other buildings were constructed in the 1980s and 1990s, by which time ownership of the property had transferred to current owner Francesco

Grande. The northern portion of the land appears to have been converted for use as a vineyard following the establishment of Falcon Nest Vineyard and Winery in the years after 2000.

The Falcon Nest Vineyard and Winery does not appear eligible for listing in the CRHR under any applicable criteria. Although the property appears to have been used for agricultural purposes dating back as early as 1919, all of the buildings associated with this stage of its development were demolished by 1956 and, as a result, the property is no longer able to convey any potential significant associations it may have with the early twentieth century agricultural development of the Paso Robles area. Since the current residence was constructed in 1962, the property has been continually altered through the construction of additional buildings as well as the conversion of the land into a vineyard as part of the Falcon Nest Vineyard and Winery. The property is no longer representative of mid-twentieth century agricultural development of the area and as a modern winery, it is does not have any significant associations with the rise of wine grape cultivation. As a result, it does not appear eligible for listing in the CRHR under Criterion 1 for associations with significant events or under Criterion 3 as a representation of agricultural design/construction. Archival research failed to identify any significant associations with important individuals and it does not appear eligible under Criterion 2. No evidence was identified to suggest that the property has the potential to yield significant information and it does not appear eligible under Criterion 4 as a result.

6.5.3 5715 Union Road

A review of historic aerial photographs and maps indicates that the first buildings on the property were constructed sometime between 1919 and 1937, by which time the property was being used as an orchard and owned by William A. and Mary L. Stanton (EDR 2016; San Luis Obispo County Clerk-Recorder 2016; USGS 1919). This use continued into the following decades as the property was sold to William L. Stanton Jr. and his wife Sally, who owned the land when the original buildings were demolished and the current residence was constructed in 1954 (San Luis Obispo County Assessor 2016). The property remained in the Stanton family through 1995, when it was sold to Donald and Claire Cass, who appear to have altered the 1954 residence through a large addition to the northeast corner (EDR 2016; San Luis Obispo County Clerk-Recorder 2016b). In 1999, the vineyard was planted when Shannon Patrick O'Neill and his wife Maureen established Mallory O'Neill Vineyards and the tasting room was constructed and opened in 2006. The winery subsequently closed in 2014 and the property was sold to Kolanu Vineyards LLC in 2016.

5715 Union Road does not appear eligible for listing in the CRHR under any applicable criteria. Although the property may have been used for agricultural purposes dating back to the early 1930s, the buildings associated with this stage of its development were demolished by 1954 and, as a result, the building is no longer able to convey any potential significant associations it may have with the early twentieth century agricultural development of the Paso Robles area. Since the current residence was constructed in 1954, the property has been altered through the construction of additional buildings as well as the conversion of the land into a vineyard. The property is no longer representative of mid-twentieth century agricultural development of the area and as a modern winery, it is does not have any significant associations with the rise of vineyards. As a result, it does not appear eligible under Criterion 1 for associations with significant events or under Criterion 3 as a representation of agricultural design/construction. Archival research failed to identify any significant information about the Stanton family or any other individuals associated with the property, and it does not appear eligible under Criterion 2 for associations with important individuals. No evidence was identified to suggest that the property has the potential to yield significant information and it does not appear eligible under Criterion 4.

6.5.4 Transmission Lines

6.5.4.1 EXISTING 500 KV TRANSMISSION LINE

The subject property is a 1.08-mile segment of an existing 500 kV transmission line, which runs between Diablo Canyon Substation to the southwest and Gates Substation to the northeast. The subject segment was constructed in the mid-1970s as PG&E expanded its electrical systems to support the growing energy needs of California's rapidly increasing population in the decades after World War II (Williams 1997). Since its construction, the line has been in continual operation and subject to routine maintenance.

The property does not appear eligible for listing in the CRHR under any applicable criteria. In considering the historical significance of the subject segment, it is a LST transmission line constructed in the 1970s as PG&E expanded its systems across the state. It was not the first transmission line constructed in Paso Robles, where electricity had first arrived in the late nineteenth century, and it was one of many such lines developed in the post-World War II era in response to rapidly increasing energy demands. The subject segment does not appear to be directly associated with any advance in electric generation or transmission that has made a significant contribution to the broad patterns of our history (Criterion 1). Archival research did not identify any associations with the lives of persons important to local or state history (Criterion 2). As a LST transmission line, the subject segment does not represent any innovations in transmission technology and does not embody the distinctive characteristics of a type, period, or method of construction, nor represent the work of a master (Criterion 3). Finally, there is no reason to believe that the property may yield important information about prehistory or history (Criterion 4).

6.5.4.2 EXISTING 230 KV TRANSMISSION LINE

The subject property is a 1.14-mile segment of an existing 230 kV transmission line, which runs between the Morro Bay Switchyard to the southwest and Gates Substation to the northeast. The subject segment, Gates Substation, and nearby Morro Bay Power Plant were constructed in the mid-1950s as part of a larger electrical system, one of many that were developed and expanded in the years after World War II to support the growing energy needs of California's rapidly increasing population (Williams 1997). Since its construction, the line has been in continual operation and subject to routine maintenance.

The property does not appear eligible for listing in the CRHR under any applicable criteria. In considering the historical significance of the subject segment, it is a LST transmission line constructed in the 1950s as PG&E expanded its systems across the state. It was not the first transmission line constructed in Paso Robles, where electricity had first arrived in the late nineteenth century, and it was one of many such lines developed in the post-World War II era in response to rapidly increasing energy demands. The subject segment does not appear to be directly associated with any advance in electric generation or transmission that has made a significant contribution to the broad patterns of our history (Criterion 1). Archival research did not identify any associations with the lives of persons important to local or state history (Criterion 2). As a LST transmission line, the subject segment does not represent any innovations in transmission technology and does not embody the distinctive characteristics of a type, period, or method of construction, nor represent the work of a master (Criterion 3). Finally, there is no reason to believe that the property may yield important information about prehistory or history (Criterion 4).

7 SUMMARY

Estrella Substation, a component of the Estrella Substation and Paso Robles Area Reinforcement Project, is located in an unincorporated portion of northern San Luis Obispo County, California, approximately 30 miles east of the Pacific Coast and halfway between the cities of Los Angeles and San Francisco. Estrella Substation will consist of the construction and operation of a new 230 kV electrical substation and a new 70 kV substation. Estrella Substation will include a 230 kV interconnection to the existing 230 kV

transmission line, and extension of an existing telecommunications system into Estrella Substation. The new substation property will occupy approximately 15 acres of land currently under vineyard cultivation. The substation will include certain components to be constructed by NEET West, and other components to be constructed by PG&E.

Cultural resources specialists requested a CHRIS records search from the CCIC, which identified no previous cultural resources studies and no previously recorded resources in the Study Area. Project proponents requested a search of the Sacred Lands Files from NAHC. The results of the Sacred Lands Files search indicate that no Native American cultural resources are known in the immediate vicinity of Estrella Substation. NAHC provided a list of two Native American representatives who may have knowledge of cultural resources in the vicinity of Estrella Substation. Both representatives have responded to the project proponents, and their official comments on the project are pending.

Archaeologists did not identify archaeological resources within the ASA during the pedestrian surveys. The buried site sensitivity study concluded that most of the ASA, including the disturbance footprint, has low potential to contain buried archaeological sites. The northeastern corner of the ASA has moderate sensitivity for buried archaeological resources due to possible overbank alluvial deposits adjacent to the Dry Canyon channel.

Architectural historians identified and recorded five historical built environment resources in the Study Area. Two recorded resources (500 kV and 230 kV transmission lines) intersect Estrella Substation project components; three recorded resources (Steinbeck Vineyards and Winery, Falcon Nest Vineyard and Winery, and 5715 Union Road) are outside Estrella Substation but within the BESA. All five built environment resources are considered ineligible for listing in the CRHR.

Fax: 650.440.4165

Email: cmontero@swca.com

Project Description:

We are requesting a record search of the Sacred Lands File and a list of appropriate Native American contacts for NextEra Energy Transmission West's Estrella Substation Project located in San Luis Obispo County, California. There are three proposed study areas that fall within the Estrella USGS 7.5 quadrangles. Two of the study areas are located approximately 3 miles east of the City of Paso Robles, adjacent and just north of Union Road. The third location is approximately 6.5 miles northeast of the City of Paso Robles and is adjacent to Estrella Road. Specifically, the project study areas are situated on Township 26 South, Range 13 East, Sections 11, 28, and 29 (MDBM). Please see the attached project location maps.

RE: Proposed NextEra Energy Transmission West Estrella Substation Project (Project #32347), near the City of Paso Robles, Estrella USGS Quadrangle, San Luis Obispo County, California

Dear Ms. Montero:

Attached is a consultation list of tribes with traditional lands or cultural places located within the boundaries of the above referenced counties. Please note that the intent above reference codes is to mitigate impacts to tribal cultural resources, as defined, for California Environmental Quality Act (CEQA) projects.

As of July 1, 2015, Public Resources Code Sections 21080.3.1 and 21080.3.2 require public agencies to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose mitigating impacts to tribal cultural resources:

> Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section. (Public Resources Code Section 21080.3.1(d))

The law does not preclude agencies from initiating consultation with the tribes that are culturally and traditionally affiliated with their jurisdictions. The NAHC believes that in fact that this is the best practice to ensure that tribes are consulted commensurate with the intent of the law.

In accordance with Public Resources Code Section 21080.3.1(d), formal notification must include a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation. The NAHC believes that agencies should also include with their notification letters information regarding any cultural resources assessment that has been completed on the APE, such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

   - A listing of any and all known cultural resources have already been recorded on or adjacent to the APE;
   - Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
   - If the probability is low, moderate, or high that cultural resources are located in the APE.
   - Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the potential APE; and
   - If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

   - Any report that may contain site forms, site significance, and suggested mitigation measurers.

     All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure in accordance with Government Code Section 6254.10.

3. The results of any Sacred Lands File (SFL) check conducted through Native American Heritage Commission. A search of the SFL was completed for the USGS quadrangle information provided with negative results.

4. Any ethnographic studies conducted for any area including all or part of the potential APE; and

5. Any geotechnical reports regarding all or part of the potential APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of a cultural place. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the case that they do, having the information beforehand well help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance we are able to assure that our consultation list contains current information.

If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

MEETING SUMMARY

Project: Estrella Substation and Paso Robles Area Reinforcement Project

Meeting: Tribal Outreach Meeting – Salinan Tribe of Monterey and San Luis Obispo Counties

Location: SWCA San Luis Obispo

Attending: Patti Dunton, Tribal Administrator, Salinan Tribe of Monterey and San Luis Obispo Counties
Matt Armstrong, Cultural Resources Specialist, PG&E
Carolyn Stewart, Director of Tribal Relations, NextEra Energy
Leroy Laurie, Cultural Resources Specialist, SWCA
Chad Jackson, Cultural Resources Specialist, SWCA

SUMMARY/HIGHLIGHTS

An outreach meeting was held with the Salinan Tribe of Monterey and San Luis Obispo Counties on August 23, 2016 at 2 pm. The meeting was initiated with attendee introductions and roles. PG&E and NEET West provided a brief project overview. Patti Dunton indicated that the tribe established a non-profit organization under which all tribal monitoring is conducted and that John Burch is the "Traditional Lead" for the tribe.

Ms. Dunton noted that the general area around the Santa Ysabel Ranch is very sensitive. Ms. Dunton asked about the findings of the field surveys conducted by SWCA and whether or not any Phase II evaluations were anticipated. She indicated she would like to have a tribal representative from her tribe on-site. No Phase II evaluations were required for the project.

Ms. Dunton requested technical report copies when they became available and indicated that she would review the project in greater detail, review the tribe's information on areas where Native American human remains have been identified, and in some cases, repatriated.

MEETING SUMMARY

Project: Estrella Substation and Paso Robles Area Reinforcement Project

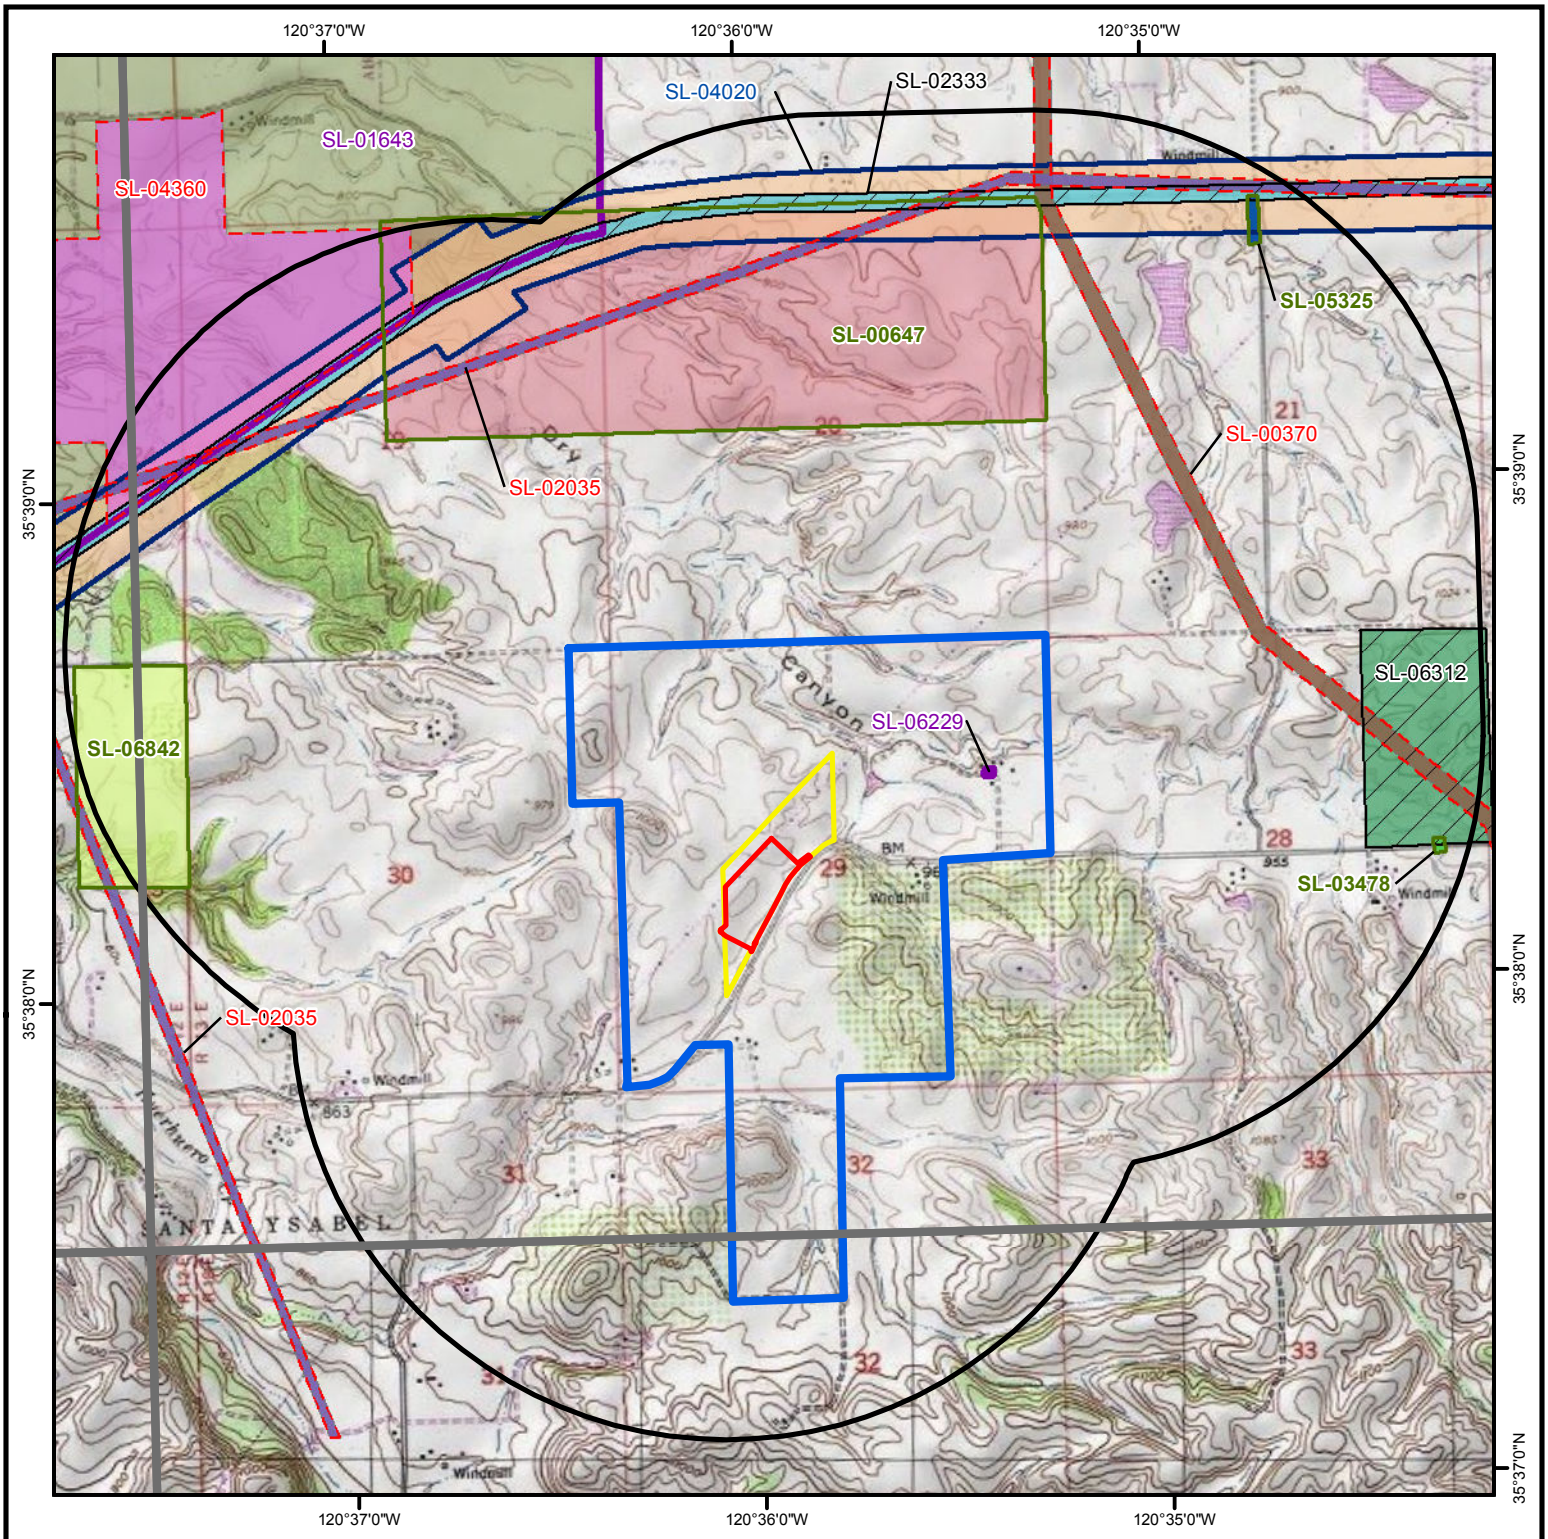
Meeting: Tribal Outreach Meeting – Xolon Salinan Tribe

Location: SWCA San Luis Obispo

Attending: Karen White, Council Chair, Xolon Salinan Tribe
Donna Haro, Tribal Headwoman, Xolon Salinan Tribe
Karen Fontanetta, Xolon Salinan Tribal Cultural Resources Consultant
Matt Armstrong, Cultural Resources Specialist, PG&E
Carolyn Stewart, Director of Tribal Relations, NextEra Energy
Leroy Laurie, Cultural Resources Specialist, SWCA

SUMMARY/HIGHLIGHTS

An outreach teleconference was held with the Xolon Salinan Tribe on August 23, 2016 at 4 pm. The teleconference was initiated with attendee introductions and roles. PG&E and NEET West provided a brief project overview. Donna Haro asked about the types of ground disturbance associated with the installation of a new power line route and at the substation location.



Ms. Haro indicated that the areas along Estrella River and Salinas River are sensitive and known Xolon Salinan affiliated cultural resources have been identified in multiple locations. Ms. Fontanetta noted that Dry Creek was used as a travel corridor by the tribe and the Dry Creek area is within traditional tribal land.

Ms. Haro stated that deep excavations near the substation have higher potential to encounter cultural resources and that a tribal monitor should be present during ground disturbance in this area. Karen Fontanetta thought that the substation site is within the historic Steinbeck Vineyard. Further research indicated the substation site is not within the historic Steinbeck Vineyard (see Figure 6 in the Substation Cultural Resources Technical Report, Cultural Resource Survey Results Map). In addition, subsequent buried site sensitivity analysis showed the substation site has low potential to contain buried archaeological sites. Ms. Fontanetta noted that an old school is depicted on a 1917 government map to the northeast of the substation site. The project will have no impacts to this school, which was not identified in the cultural resources study area for the project.

Ms. Haro asked about the findings of the field surveys conducted by SWCA and whether or not any Phase II evaluations were anticipated. She indicated she would like to have a tribal representative from her tribe on-site for any Phase II evaluations. No Phase II evaluations were required for the project. Ms. Haro indicated they would wait to provide specific comments.

EXECUTIVE SUMMARY

A Paleontological Resources Technical Report (PRTR) has been prepared for the Estrella Substation component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by Pacific Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC (NEET West). NEET West proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by PG&E that together comprise Estrella Substation, in north-central San Luis Obispo County. The new substation, bound by Union Road to the south and surrounded by agricultural lands, will occupy approximately 15 acres of land currently under vineyard cultivation.

This PRTR was conducted to evaluate the paleontological sensitivity of the project. This report presents the results of the paleontological records search, literature review, resource assessment, and field investigation completed for the project substation site.

The museum records searches were performed between April 14 and 19, 2016. The field investigation of the project area was performed on May 16 and 17, 2016. This technical report was completed in October 2016.

Geologic mapping by Dibblee and Minch (2004) indicates that Estrella Substation is underlain by the Pleistocene Paso Robles formation (3.6–2.6 Million years ago). Museum collections records maintained by the Natural History Museum of Los Angeles County and the University of California Museum of Paleontology indicate that one previously recorded fossil locality exists within a 1-mile radius of the substation site boundaries and seven fossil localities have been recorded within a 15-mile radius. No fossils were discovered during the field investigation. The combined results of the museum records searches, literature review, and field investigation indicate that geologic units underlying the project area have a Potential Fossil Yield Classification of High (4b).

1 INTRODUCTION

NextEra Energy Transmission West, LLC (NEET West) proposes to construct and operate a 230 kilovolt (kV) substation and conduct the site preparation activities for a 70 kV substation to be constructed and operated by Pacific Gas and Electric Company (PG&E) that together comprise Estrella Substation, in northern San Luis Obispo County, California (Figure 1). NEET West is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by NEET West and PG&E.

This Paleontological Resource Technical Report (PRTR) was conducted for the development of Estrella Substation, and to evaluate the paleontological sensitivity of the substation site. This study was conducted in accordance with professional guidelines established by the Society of Vertebrate Paleontology (SVP 1995, 2010) and the U.S. Bureau of Land Management (BLM) (2007).

1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The project substation site is located on approximately 15 acres within an approximately 98-acre privately owned parcel (Assessor's Parcel Number 015 053-011).

1.2 Project Component

Estrella Substation will be comprised of two separate and distinct substations. One 230 kV substation will be constructed, operated, and owned by NEET West and one 70 kV substation will be constructed (following site preparation and rough grading work by NEET West), operated, and owned by PG&E. The 230 kV substation will be interconnected to the existing adjacent 230 kV transmission line. Access to the Estrella Substation site will be off Union Road, on a new main private access road.

2 REGULATORY BACKGROUND

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under federal (Paleontological Resources Preservation Act), state (California Environmental Quality Act [CEQA]; California Public Resources Code [PRC]), and county (*County of San Luis Obispo General Plan*) laws, ordinances, and regulations. This study satisfies project requirements in accordance with CEQA (Title 14, Division 6, Chapter 3, California Code of Regulations [CCR] 15000 et seq.), and PRC (Chapter 1.7) Sections 5097.5 and 30244. The SVP (1995, 2010) has established professional standards for the assessment and mitigation of adverse impacts to paleontological resources. The following sections describe specific laws, ordinances, and regulations that are applicable to Estrella Substation.

2.1 Federal

A federal agency is not approving, implementing, or funding the project or any element of it; therefore, federal ordinances and regulations would not apply to this project.

2.2 State

2.2.1 California Environmental Quality Act

State guidelines for the implementation of CEQA, as amended March 29, 1999 (14 CCR Division 6, Chapter 3, 15000 et seq.) define procedures, types of activities, persons, and public agencies required to comply with CEQA. The guidelines include as one of the questions to be answered in the Environmental Checklist (Appendix G, Section V, Part c) the following: "*Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?*"

CEQA includes in its definition of historical resources, "any object [or] site …that has yielded or may be likely to yield information important in prehistory" (14 CCR 15064.5[3]), which is typically interpreted as including fossil materials and other paleontological resources. More specifically, destruction of a "unique paleontological resource or site or unique geologic feature constitutes a significant impact under CEQA" (State CEQA Guidelines Appendix G). CEQA does not provide an explicit definition of a "unique paleontological resource," but a definition is implied by comparable language within the act relating to archeological resources: "The procedures, types of activities, persons, and public agencies required to comply with CEQA are defined in: Guidelines for the Implementation of CEQA, as amended March 29, 1999" (14 CCR Chapter 3, 15000 et seq.).

CEQA encourages the protection of all aspects of the environment by requiring state and local agencies to prepare multidisciplinary analyses of the environmental impacts of a proposed project, and to make decisions based on the findings of those analyses. Treatment of paleontological resources under CEQA is generally conducted according to guidance from the SVP or other agencies (BLM, etc.) and typically includes identification, assessment, and development of mitigation measures for potential impacts to significant or unique resources.

Appendix G (Part V) of the State CEQA Guidelines provides guidance relative to significant impacts on paleontological resources, which states, "a project will normally result in a significant impact on the environment if it will … disrupt or adversely affect a paleontological resource or site or unique geologic feature, except as part of a scientific study."

2.2.2 California Public Resources Code

The PRC (Chapter 1.7, Sections 5097.5 and 30244) includes additional state level requirements for the assessment and management of paleontological resources. These statutes require reasonable mitigation of adverse impacts to paleontological resources resulting from development on state lands, define the removal of paleontological sites or features from state lands as a misdemeanor, and prohibit the removal of any paleontological site or feature from state land without permission of the applicable jurisdictional agency.

PRC Section 30244 requires reasonable mitigation for impacts on paleontological resources that occur as a result of development on public lands. Further, the California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources.

2.3 Local

Because the California Public Utilities Commission has exclusive jurisdiction over the siting, design, and construction of the project, the project is not subject to local discretionary regulations.

3 METHODOLOGY

3.1 Professional Standards

While there is no professional certification for the practice of mitigation paleontology, multiple agencies, professional organizations, and individual paleontologists have developed guidelines for best practices in mitigation paleontology.

The SVP is the largest professional organization of paleontologists and has established standard guidelines that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation (1995, 2010). Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as described in the standard guidelines of the SVP. Typically, state regulatory agencies accept and use the professional standards set forth by the SVP.

BLM has also developed a comprehensive set of guidelines for the protection of fossil resources in land-use planning, analysis of potential impacts to fossil resources, development of sensitivity rankings, mitigation and monitoring, and permitting (BLM 2007). Furthermore, a small but significant body of scientific literature exists regarding best practices in paleontological mitigation (Knauss et al. 2014; Murphey et al. 2014) and case studies of successful mitigation projects (for example, see Benson 1998; Haasl et al. 2009; Dundas et al. 2013; Tomassi et al. 2015).

3.2 Literature Review and Records Search

The location of the project substation site was the subject of thorough background research and analysis, including geologic map and literature reviews, aerial photography, and records searches from the University of California Museum of Paleontology (Finger 2016) and the Natural History Museum of Los Angeles County (McLeod 2016). The purpose of the literature review was to evaluate the paleontological sensitivity of the Estrella Substation in order to identify known fossil resources within it or nearby in the same geologic formations. The records searches were requested for any previously recorded fossil localities in the Paleontological Study Area, which encompasses the project substation site (as shown on Figure 2) or within a 1-mile radius. Geotechnical data for the footprint of Estrella Substation was also available (Appendix L to the PEA). These data were combined to develop paleontological sensitivity rankings for the geologic units present in and around the project substation site.

3.3 Field Inspection

The field inspection was designed to determine the presence of paleontologically-sensitive geologic units throughout Estrella Substation, both on the land surface and, if possible, in the subsurface. Figures 2 through 4 show the area covered by the field survey. Paleontological surveys are largely dependent on local environmental factors, including topography, erosion, vegetation cover, and human development. Typically, survey routes follow the landscape, with focus given to areas where washes and channels dissect surface deposits and expose layered strata. Because washes collect and concentrate fossils eroded from channel banks, it is more likely they will be observed in these areas, which are also generally free of the soils that may cover fossils. Therefore, the field survey was limited to areas with potential exposure of fossiliferous deposits in and around the project footprint.

The field survey was conducted by paleontologists between May 16 and 17, 2016. The surveyed area covered the project substation site (Figure 2), as well as potentially informative outcrops in the near vicinity, and did not discover any new paleontological localities. This survey was focused on identifying: 1) surface fossils; 2) exposures of potentially fossiliferous rock; and 3) areas in which fossiliferous rock may be exposed or otherwise impacted during construction. Due to the current agricultural development of the site, localities nearby that exposed the surface and subsurface geology of the area were also examined.

4 RESULTS

4.1 Literature Review

4.1.1 Geologic Setting

California comprises the following twelve geomorphic provinces, each distinguished from one another by having unique topographic features and geologic formations: (1) the Sierra Nevada; (2) the Klamath Mountains; (3) the Cascade Range; (4) the Modoc Plateau; (5) the Basin and Range; (6) the Mojave Desert; (7) the Colorado Desert; (8) the Peninsular Ranges; (9) the Transverse Ranges; (10) the Coast Ranges; (11) the Great Valley; and (12) the Offshore area (Norris and Webb 1990). Estrella Substation is located within the central Coast Ranges province, which is bounded to the north by the Klamath Mountains, to the east by the Great Valley, and to the south by the Transverse Ranges (Norris and Webb 1990). The Coast Ranges occupy the Pacific Coast of California from the northern border with Oregon to a point just north of Santa Barbara, a distance of around 590 miles (Norris and Webb 1990). Mountains in the Coast Ranges vary from 2,000 to 6,000 feet above sea level and trend north-west, roughly following the San Andreas Fault (Norris and Webb 1990).

The rocks of the Coast Ranges province are a thick series of Mesozoic and Cenozoic sedimentary strata overlying either the bedrock granites in the Salinian block or the metamorphosed Franciscan complex (Harden 2004). The Franciscan subduction complex consists of metamorphosed sedimentary rocks derived from the rapid erosion of volcanic uplands and their subsequent deposition in deep marine basins during the middle Jurassic (150–165 million years ago [Ma]) (Wakabayashi 2011). The Franciscan is on average 7,600 meters thick and is exposed over an area of around 190,000 square kilometers (Norris and Webb 1990). The Salinian block represents a magmatic arc and consists of metamorphic rocks and granitic plutons varying from granodiorite and quartz monzonite to quartz diorite dating from the Late Cretaceous (69–110 Ma) (Barbeau et al. 2005). After Mesozoic deposition shifted to continental shelf origins, a thick series of Cenozoic sedimentary rocks were deposited in the Coast Ranges, the largest of which is the Miocene Monterey formation (approximately 13–15 Ma), a marine unit characterized by organic deposits (Follmi et al. 2005). During the Pliocene (2.6–5.3 Ma), the sea had withdrawn from most of the Coast Ranges and erosion of the uplands onto valley floors was prominent by the Pleistocene (2.6 Ma) and continues today

(Norris and Webb 1990). Coincident with the withdrawal of the sea was the initiation of the Coast Ranges orogeny, creating the topography observed today (Harden 2004).

According to mapping by Dibblee and Minch (2004), the project substation site is underlain by the Paso Robles formation. This geologic unit and its paleontological resource potential are discussed in more in Table 1.

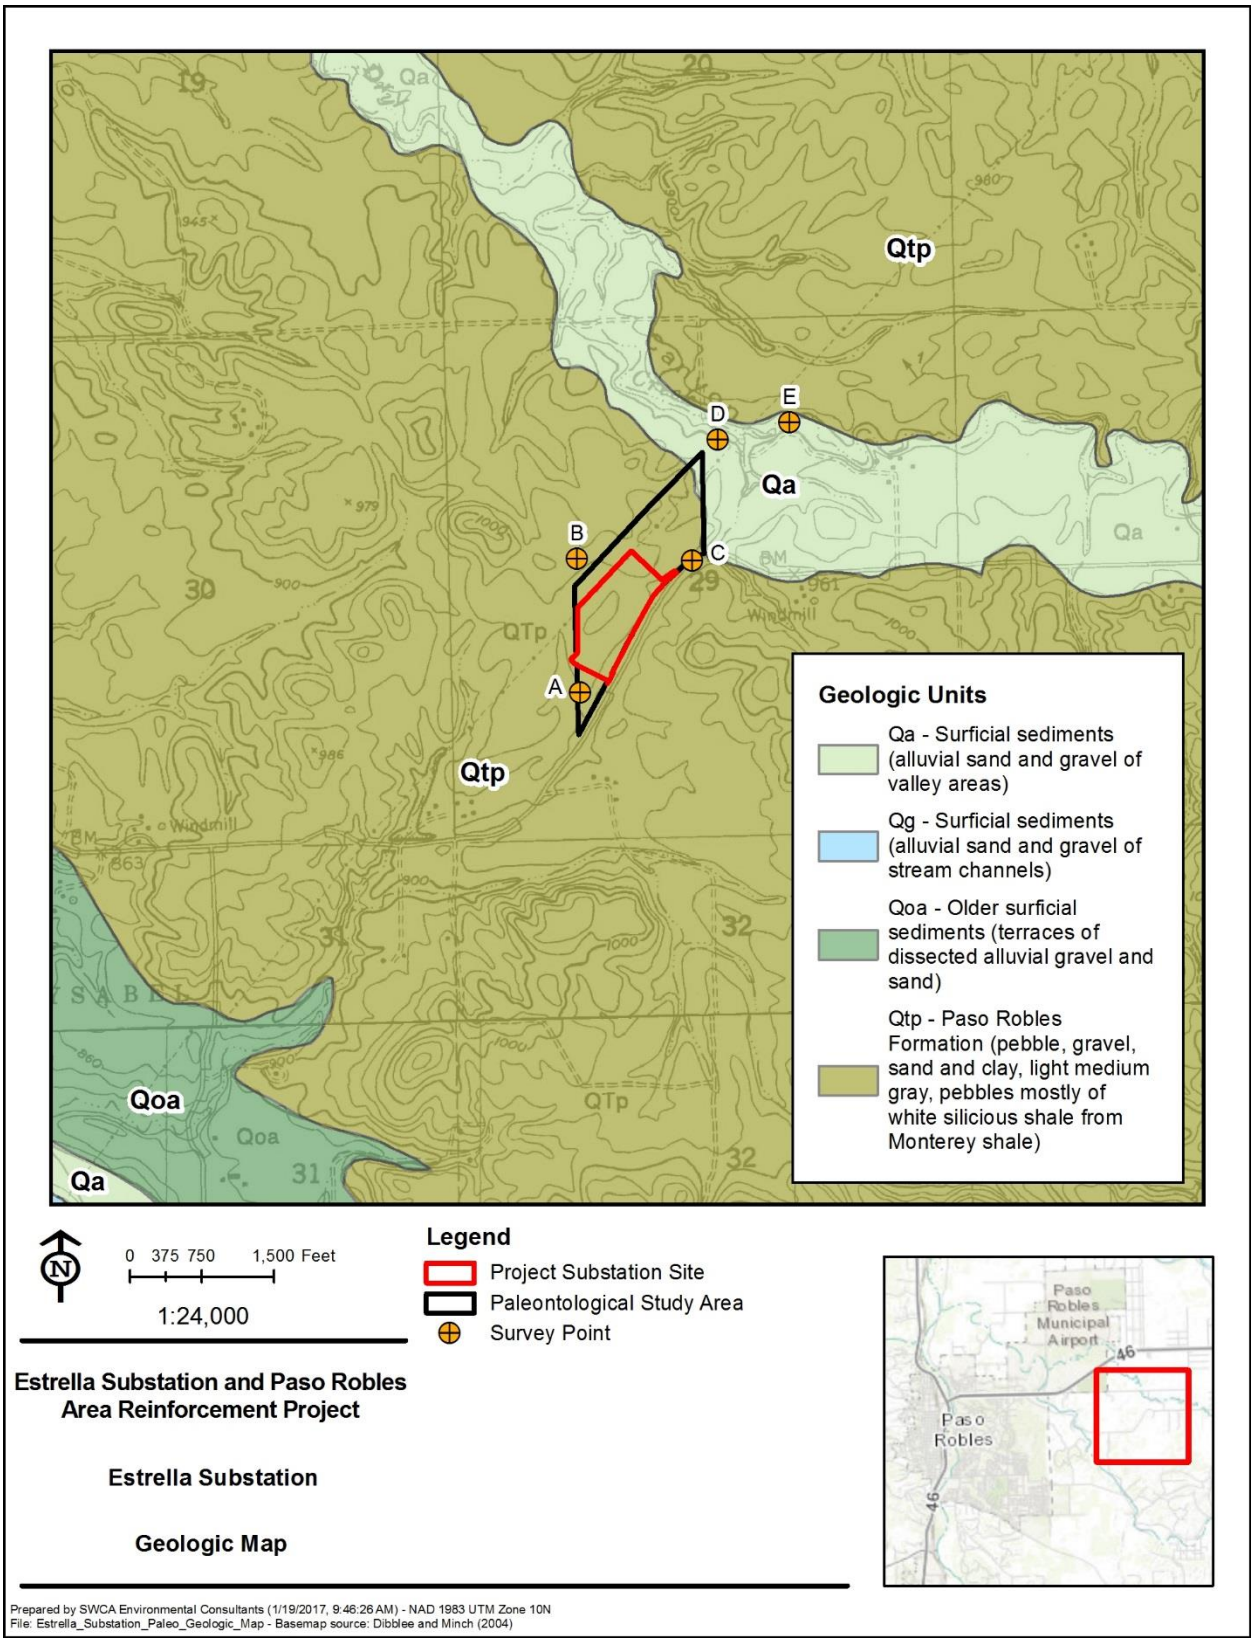
4.1.2 Geology and Paleontology

4.1.2.1 PASO ROBLES FORMATION

The project substation site is directly underlain by the Paso Robles formation (mapped as Qtp in Figure 3). The Paso Robles formation dates from the Pleistocene to the latest Pliocene (3.6–2.6 Ma) and consists of weakly indurated pebble, gravel, sand, and clay and includes redeposited materials from the Monterey formation (Dibblee and Minch 2004). In some areas, limestone is a minor constituent as well (Woodring and Bramlette 1950). Facies-level studies have not been conducted to date on the Paso Robles formation, and so the level of detail at which this unit is discussed, including for fossil resources, must remain at the formation level. The Paso Robles formation unconformably overlies the Monterey formation and is exposed almost continuously throughout the upper Salinas Valley (Addicott and Galehouse 1973), including the area around Paso Robles where Estrella Substation is located. The Paso Robles formation contains facies of both marine and nonmarine origins (Woodring and Bramlette 1950). Significant fossils were first found in the Paso Robles formation in 1921 with the discovery of a marine mammal identified as an undescribed seal (pinniped) (Kellogg 1921). Additionally, a large number of marine bivalves including *Ostrea vespertina*, *O. atwoodi*, *Nettastomella rostrata*, and *Hinnites giganteus* (Addicott and Galehouse 1973), as well as smaller numbers of freshwater gastropods and ostracodes (Woodring and Bramlette 1950), has been reported from the Paso Robles formation. A summary of the geologic units present at the surface and likely present in the subsurface of Estrella Substation is presented in Table 1.

4.1.2.2 QUATERNARY YOUNGER ALLUVIUM

To the north and northeast of the project substation site, Holocene-aged (0.01 Ma–present) alluvial gravel, sand, and clay occurs (mapped as Qa in Figure 3) (Dibblee and Minch 2004). This unit is commonly found alongside stream channels and, due to its young age, is unlikely to preserve fossils.



4.1.2.3 QUATERNARY OLDER ALLUVIUM

While not mapped at the surface in or around project substation site, older alluvial sediments may occur in the subsurface. These sediments are Pleistocene (0.01–2.6 Ma) in age and consist of dissected terraces of gravel and sand (Dibblee and Minch 2004). The older alluvial sediments may underlie the younger alluvial sands and gravels to the north and northeast of the substation footprint, and can be difficult to distinguish from these younger sediments. A number of fossil finds have been reported in the literature from the older alluvial sediments in San Luis Obispo County (Jefferson et al. 1992).

Table 1. Geologic Units within the Estrella Substation

Geologic Unit	Age	Lithology
Quaternary younger alluvium	Holocene (0.1 Ma – present)	Alluvial sands and gravels
Quaternary older alluvium (Qoa)	Pleistocene (2.6 – 0.01 Ma)	Dissected alluvial gravels and sands
Paso Robles formation (Qtp)	Pleistocene – late Pliocene (3.6 – 2.6 Ma)	Weakly indurated clays-gravels of marine & nonmarine origins

Figure 3. Geologic Map

4.2 Records Search Results

A records search request was submitted to the University of California Museum of Paleontology and the Natural History Museum of Los Angeles County for Paleontological Study Area and a 1-mile radius. While neither institution has records of fossil localities within the project substation site, both museums record vertebrate fossil localities in the vicinity. The nearest fossil locality to the project substation site is less than 1 mile away, in a wash off Dry Canyon between State Route 46 and Union Road where the Natural History Museum of Los Angeles County recovered fossil specimens of stickleback fish (*Gasterosteus*), giant tortoise (*Geochelone*), and horse (Equidae) in the Paso Robles formation (Qtp) (McLeod 2016). Outside of the search radius within approximately 15 miles of project substation site, the University of California Museum of Paleontology has four known fossil localities (Finger 2016; see also Appendix A) and the Natural History Museum of Los Angeles County has two additional localities (McLeod 2016; see also Appendix B). All of these localities occur in either Quaternary older alluvium (Qoa), which outcrops just to the southwest of the project substation site (see Figure 3), or the Monterey formation, which does not occur at the surface in the project area.

4.3 Field Inspection and Geotechnical Data

The field inspection did not discover any paleontological resources or any paleontologically sensitive geologic formations on the ground surface in the substation footprint, due to the nearly complete coverage of the area by an active vineyard (see Appendix C). Table 2 summarizes the results of the field survey. Traverses by the surveyors across the project footprint did not observe any geologic features. Survey points identified along road cuts and streambeds in the survey area surrounding the Paleontological Study area allowed surveyors to gather basic information about the subsurface geology. In general, non-sensitive geologic units such as the Holocene alluvium (Qa) and surface soils range greatly in thickness, from under 1 foot up to 6 feet. Just to the east of the project substation site, a cut bank in a dry streambed, which runs along the northern boundary of Paleontological Study Area, exposed around 30 feet of subsurface geology, which shows approximately 5 to 8 feet of soil formation and younger alluvium overlying and grading into the underlying strata. Comparison of this subsurface strata to the geologic literature indicated the likely presence of Quaternary older alluvium (Qoa) overlying the Paso Robles formation (Qtp). This site is very near the substation (under 0.5 mile) and is mapped as Quaternary alluvium on the surface (Dibblee and Minch 2004), and it is reasonable to predict a similar subsurface geology may be found within the project substation site.

Geotechnical data derived from borings within the project area are consistent with the observations of the subsurface geology from just outside of the project area. Borings identified 8–12 inches of topsoil overlying sands, clayey sands, clays, and silts (Appendix L to the PEA) that are consistent with the lithologies of the Paso Robles formation as well as Quaternary older alluvium. More recent geotechnical studies supported these conclusions (Appendix M to the PEA).

Topography:	Dry stream bed, approximately 30-foot cut bank
Surface Exposure/Development:	Vineyard, grasses, soils
Geologic Description:	Soil grades into reddish older alluvium (6–9 feet), overlying yellow-tan Paso Robles formation (approximately 18 feet exposed)

5 PALEONTOLOGICAL SIGNIFICANCE AND SENSITIVITY

The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist and their value may be greatly diminished or lost entirely in the absence of proper management. Thus, once destroyed, a fossil can never be replaced (Murphey and Daitch 2007). Paleontological resources are objects of national significance that are worthy of preservation for the inspiration and interpretive opportunities they offer. Fossils are important scientific and educational resources and can be used to:

- study the phylogenetic relationships amongst extinct organisms, as well as their relationships to modern groups;
- elucidate the taphonomic, behavioral, temporal, and diagenetic pathways responsible for fossil preservation, including the biases inherent in the fossil record;
- reconstruct ancient environments, climate change, and paleoecological relationships;
- provide a measure of relative geologic dating which forms the basis for biochronology and biostratigraphy, and which is an independent and corroborating line of evidence for isotopic dating;
- study the geographic distribution of organisms and tectonic movements of land masses and ocean basins through time;
- study patterns and processes of evolution, extinction, and speciation; and,
- identify past and potential future human-caused effects to global environments and climates (Murphey and Daitch 2007).

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are any remains, imprints, or traces of once-living organisms preserved by natural processes in the geologic record. These include mineralized or un-mineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. Paleontological resources include not only fossils, but also organic matter and the physical characteristics of the associated sedimentary matrix. The geologic character of the rock record preserves the ecological, geographic, and evolutionary context of past life represented by fossils. Scientific importance may be attributed to the actual fossil specimen, to fossil context (e.g., location in time and space, intimate association with other evidence of scientific significance), or to fossil preservation.

5.1 Definitions of Significance and Significance Criteria

In paleontology, the term “significance” refers to the scientific value of a particular fossil or fossil site. A number of federal and professional organizations have developed significance criteria for the evaluation of fossil finds; however, there are currently no criteria under CEQA for determining the significance of a fossil. Instead, CEQA requires consideration of whether an activity will “directly or indirectly destroy a unique paleontological resource or site or unique geologic feature” (State CEQA Guidelines, Appendix G, Section V).

In the absence of a codified definition of significance, the SVP has established working definitions that most practicing professional vertebrate paleontologists adhere to closely (1995, 2010). As defined by the SVP, significant nonrenewable paleontological resources are:

> *...Fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments* (SVP 1995:26).

Furthermore, as defined by the SVP, significant fossiliferous deposits are:

> *A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information* (1995:26).

Strategies for assessing the significance of a fossil are based on the types of scientific information that can be obtained, and must involve an understanding of the known fossil record and associated research questions relating to a given rock unit or fossil assemblage. The value or importance of different fossil groups varies, depending on age and depositional environment of the rock unit containing the fossils, their rarity, the extent to which they have already been identified and documented, and the ability to recover similar materials under more controlled conditions (e.g., research project). A fossil must also be in a good state of preservation to be considered significant. Unlike sensitivity determinations, significance determinations are made on the fossil collection itself.

An individual fossil specimen may therefore be considered unique or significant if it is identifiable and well preserved, and it meets one of the following criteria:

- a type specimen (i.e., the individual from which as species or subspecies has been described);
- a member of a rare species;
- a species that is part of a diverse assemblage (i.e., a site where more than one fossil has been discovered) wherein other species are also identifiable, and important information regarding life histories of individuals can be drawn;
- an element different from, or more complete than, those now available for its species; or,
- a complete specimen.

More specifically, fossils may be considered significant if they meet the following research criteria:

- taxonomy – fossils that are scientifically judged to be important for representing rare or unknown taxa, such as defining a new species;
- evolution – fossils that are scientifically judged to represent important stages in evolutionary relationships, to fill gaps, or enhance under-represented intervals in the stratigraphic record;
- biostratigraphy – fossils that are scientifically judged to be important for determining or constraining relative geologic age, or for use in regional to interregional stratigraphic correlation;

- paleoecology – fossils that are scientifically judged to be important for reconstructing ancient organism community structure and interpretation of ancient sedimentary environment; or,

- taphonomy – fossils that are scientifically judged to be exceptionally well or unusually or uniquely preserved, or are relatively rare in the stratigraphy.

5.2 Definitions of Sensitivity and Sensitivity Criteria

Paleontological sensitivity is the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Occurrences of paleontological resources are closely related to the geologic units in which they are contained, and the potential for finding scientifically important paleontological resources can be broadly predicted by the presence of the pertinent geologic units at or near the surface. Therefore, geologic mapping can be used as a proxy for assessing the potential for occurrences of important paleontological resources.

5.3 Potential Fossil Yield Classification System

BLM devised a system for evaluating the paleontological resource potential of geologic formations. The Potential Fossil Yield Classification (PFYC) system ranks deposits on a 1 to 5 scale, with 5 having the highest potential, and uses geologic mapping as a predictive tool to identify areas of paleontological sensitivity.

The PFYC system is meant to provide baseline guidance for predicting, assessing, and mitigating paleontological resources. The PFYC system is based on the "relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential" (BLM 2007). This classification is applied to the geologic formation, member, or other distinguishable unit, preferably at the most detailed mappable level. PFYC classification does not reflect rare or isolated occurrences of significant fossils or individual localities, only the relative occurrence on a formation or member-wide basis. Any rare occurrences will require additional assessment and mitigation if they fall within the area of anticipated impacts.

The PFYC System is not intended to be applied to specific paleontological localities or small geographic areas within geologic units. Although significant localities may occasionally occur in a geologic unit, the existence of a few important fossils or localities widely scattered over a large area does not necessarily indicate a higher classification for the unit. The relative abundance of significant localities is intended to serve as the major determinant for the class assignment. The PFYC System is intended to provide baseline guidance for predicting, assessing, and mitigating impacts on paleontological resources.

Guidelines from the BLM describe the PFYC system as follows:

Class 1 – Very Low: Geologic units that are not likely to contain recognizable fossil remains.

- Units that are igneous or metamorphic, excluding reworked volcanic ash units.
- Units that are Precambrian in age or older.

Class 2 – Low: Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant nonvertebrate fossils.

- Vertebrate or significant invertebrate or plant fossils not present or very rare.
- Units that are generally younger than 10,000 years before present.

- Recent aeolian deposits.
- Sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration).

Class 3 – Moderate or Unknown: Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence; or sedimentary units of unknown fossil potential.

- Often marine in origin with sporadic known occurrences of vertebrate fossils.
- Vertebrate fossils and scientifically significant invertebrate or plant fossils known to occur intermittently; predictability known to be low.

  (or)

- Poorly studied and/or poorly documented. Potential yield cannot be assigned without ground reconnaissance.

Class 3a – Moderate: Units are known to contain vertebrate fossils or scientifically significant nonvertebrate fossils, but these occurrences are widely scattered. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for hobby collecting. The potential for a project to be sited on or impact a significant fossil locality is low, but is somewhat higher for common fossils.

Class 3b – Unknown: Units exhibit geologic features and preservational conditions that suggest significant fossils could be present, but little information about the paleontological resources of the unit or the area is known. This may indicate the unit or area is poorly studied, and field surveys may uncover significant finds. The units in this Class may eventually be placed in another Class when sufficient survey and research is performed. The unknown potential of the units in this Class should be carefully considered when developing any mitigation or management actions.

Class 4 – High: Geologic units containing a high occurrence of significant fossils. Vertebrate fossils or scientifically significant invertebrate or plant fossils are known to occur and have been documented, but may vary in occurrence and predictability. Surface disturbing activities may adversely affect paleontological resources in many cases.

Class 4a: Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than 2 acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions. Illegal collecting activities may impact some areas.

Class 4b: These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than 2 contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

Class 5 – Very High: Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils, and that are at risk of human-caused adverse impacts or natural degradation.

Class 5a: Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than 2 acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions. Unit is frequently the focus of illegal collecting activities.

Class 5b: These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has very high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than 2 contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

5.4 Determination of Sensitivity for Geologic Units within the Vicinity of Estrella Substation

The literature and museum records searches and the ground survey revealed that the primary rock unit mapped in the project substation site, the Paso Robles formation, is known to be fossiliferous and has produced scientifically significant localities in the past. Based on the PFYC system developed by the BLM (2007), the Paso Robles formation should be classified as 4b, high with ground cover (Figure 4). While Pleistocene older alluvium is not mapped in the project area, it is present to the southwest and sediments identified as consistent with this unit were observed during the ground survey just to the east-northeast of Estrella Substation. Therefore, it cannot be ruled out that some older alluvium may be present overlying the Paso Robles formation in the vicinity of the project substation site. Quaternary older alluvium would also have a PFYC classification of 4b, high with ground cover (Figure 4). Quaternary younger alluvium (Qa), which occurs along the streambed to the north of the project area, is too young to contain fossils and is classified as PFYC Class 2, low (Figure 4). A summary of the geologic units present at the surface and likely present in the subsurface of the project area is presented in Table 3. Their approximate locations are presented in Table 4.

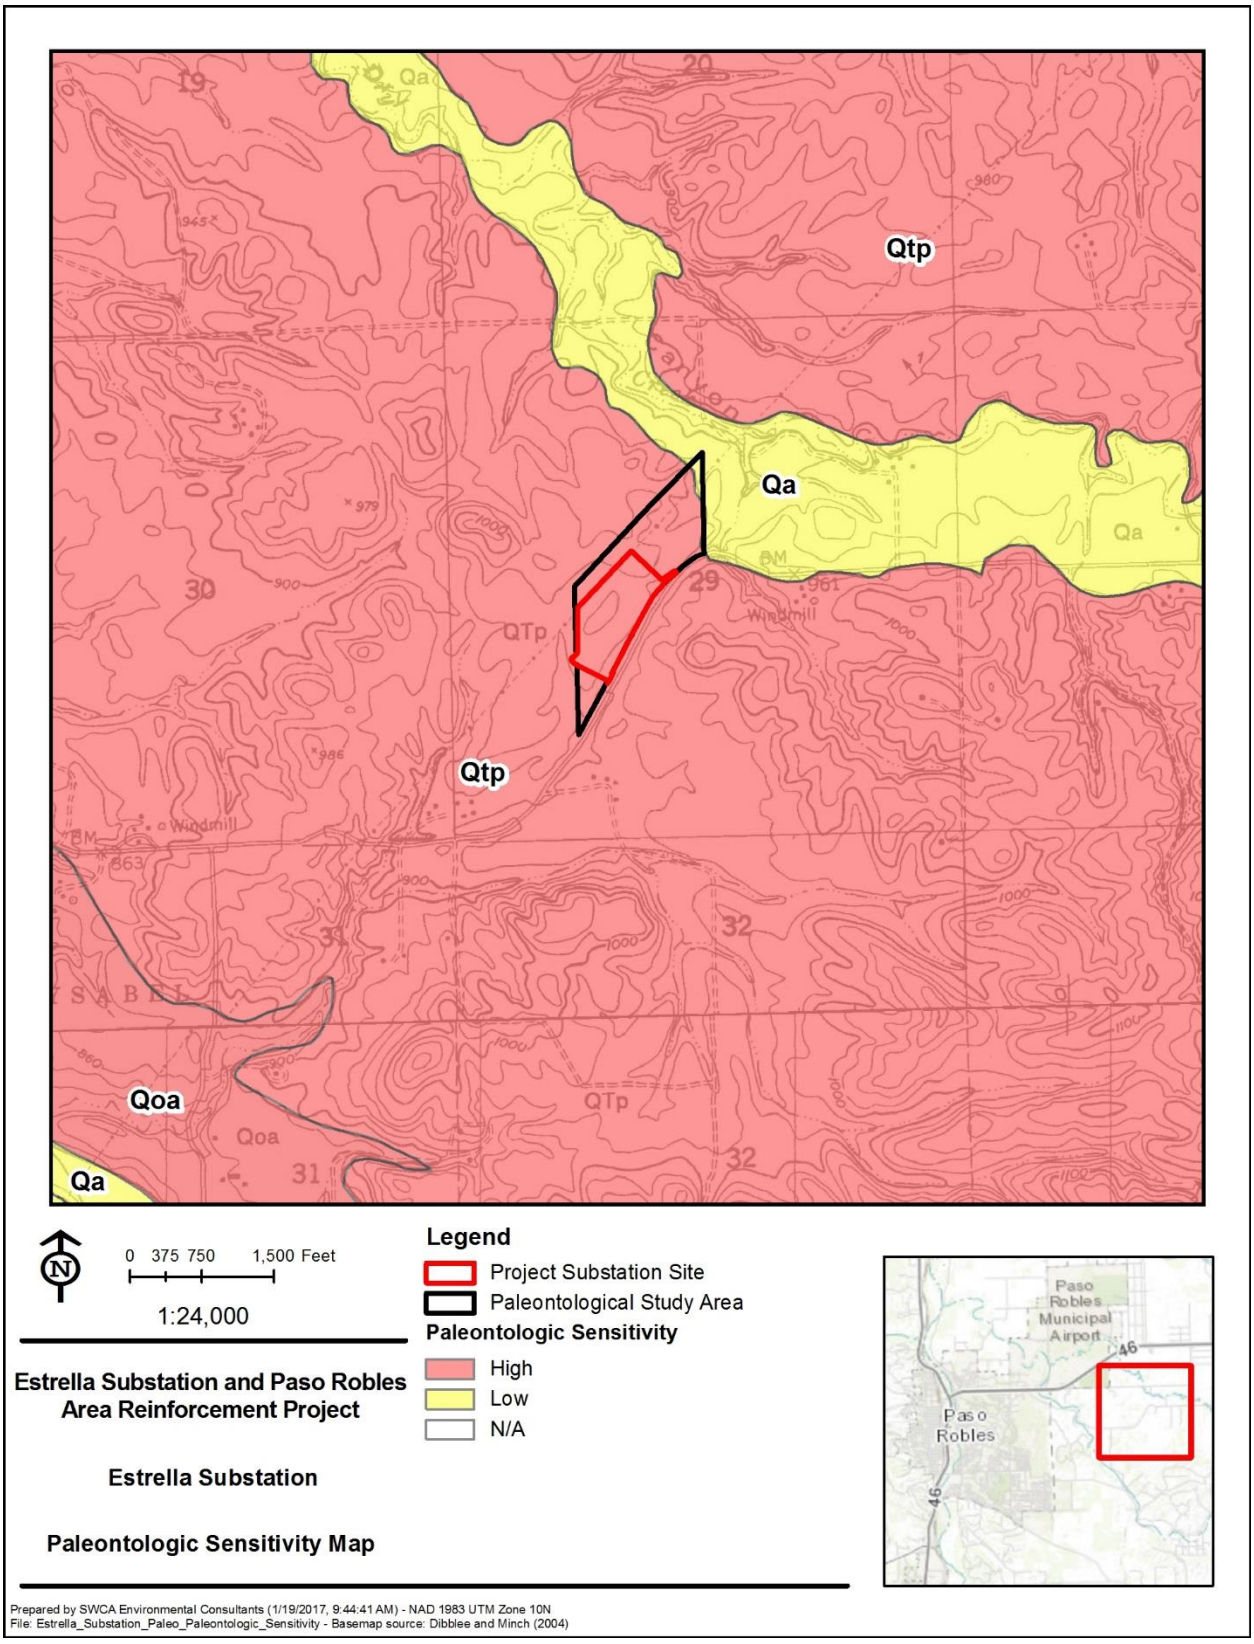

Table 3. Paleontological Sensitivity of Geologic Units at Estrella Substation

Geologic Unit	Age	Potential Fossil Yield Classification
Quaternary younger alluvium	Holocene	Low – Class 2
Quaternary older alluvium (Qoa)	Pleistocene	High – Class 4b
Paso Robles formation (Qtp)	Pleistocene–late Pliocene (3.6–2.6 Ma)	High – Class 4b

Table 4. Approximate Locations of Geologic/Sensitive Units at Estrella Substation

Geologic Unit	Location
Quaternary younger alluvium	Exposures along the extreme north-eastern boundary of the paleontological survey area
Quaternary older alluvium (Qoa)	Possible occurrence in the subsurface, immediately below soil horizon and agricultural disturbance
Paso Robles formation (Qtp)	Mapped occurrence in the subsurface, below soil horizon and agricultural disturbance or, if Qoa is present, underlying that unit

ALYSSA BELL, PH.D., PRINCIPAL INVESTIGATOR

As a paleontological principal investigator, Dr. Bell has supervised field work, authored project reports, and provided scientific and compliance direction and quality control for SWCA's paleontological projects throughout California. Aside from her work with SWCA, Dr. Bell is a postdoctoral research assistant at the Dinosaur Institute of the Natural History Museum of Los Angeles County. There she is involved in pursuing her own research into fossil birds as well as working with the Institute's field projects and museum-wide education and outreach initiatives. Dr. Bell has accumulated a wealth of field experience, working with crews from a variety of institutions on field sites in Arizona, California, Montana, New Mexico, South Dakota, and Utah, as well as leading her own expeditions in Montana. She has published nine peer-reviewed articles or book chapters and given numerous presentations at scientific conferences on both her paleontological and microbiological research.

Archaeological and other heritage resources can be damaged or destroyed through uncontrolled public disclosure of information regarding their location.

Information regarding the location, character, or ownership of a cultural resource is exempt from the Freedom of Information Act pursuant to 16 United States Code (U.S.C.) 470w-3 (National Historic Preservation Act) and 16 U.S.C. Section 470(h) (Archaeological Resources Protections Act).

EXECUTIVE SUMMARY

A Cultural Resources Technical Report (CRTR) has been prepared for the 70 kilovolt (kV) power line component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by Pacific Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC. PG&E proposes to construct and operate approximately 7 miles of new overhead 70 kV double-circuit power line between Estrella Substation and an existing 70 kV power line, and reconductor approximately 3 miles of the existing 70 kV power line from the point of connection to the existing Paso Robles Substation in the city of Paso Robles. PG&E will undertake this portion of the project

This CRTR was prepared to identify, describe, and evaluate cultural resources in the vicinity of the power line. This study was completed in compliance with and in satisfaction of the California Environmental Quality Act (CEQA). California Public Resources Code (PRC) Section 5024.1, California Code of Regulations (CCR) Title 14, Section 15064.5 of the State CEQA Guidelines, and PRC Sections 21083.2 and 21084.1 were also used as the basic guidelines for the cultural resources study (Governor's Office of Planning and Research 1998). This report follows guidance outlined *Cultural Resources Study Plan Electric Transmission – Greenfield Projects Rev. 7.1.16* (PG&E 2016).

PG&E requested a search of the California Historical Resources Information System (CHRIS) from the Central Coast Information Center (CCIC), located at the University of California, Santa Barbara. The CCIC returned results on April 12, 2016. On March 29, 2016, PG&E requested a search of the Sacred Lands Files from the Native American Heritage Commission (NAHC). A response was received by email from the NAHC on March 30, 2016. Archaeologists conducted an intensive pedestrian archaeological survey of the study area May 16–19, 2016. A supplemental survey was conducted on November 15, 2016. An architectural historian conducted the built environment field survey of the study area May 16–20, 2016.

Results of the CHRIS records search revealed that 71 previous cultural resource studies have been conducted within a 0.5-mile radius of the study area. Of these studies, 21 overlap with the study area. Approximately 10 percent of the project area has previously been subject to cultural resources survey. The CHRIS records search also identified 37 previously recorded cultural resources within a 0.5-mile radius of the study area. Of these resources, only two (P-40-038110 and P-40-38111) are plotted by the CCIC as being within the study area. P-40-38110 is a historical isolate consisting of three ceramic fragments. P-40-38111 is a prehistoric isolate consisting of a single biface fragment. The cultural resources investigation identified 16 new resources in the study area. These include two historical archaeological sites (36052-S-001; 36052-S-002), one prehistoric archaeological site (36052-S-003), seven isolated artifacts (36052-ISO-002; 36052-ISO-003; 36052-ISO-004; 36052-ISO-005; 36052-ISO-006; 36052-ISO-007; 36052-ISO-008), and six built environment resources.

Archaeological site 36052-S-001 consists of a historical well feature and utility pole with remnant glass insulators. Site 36052-S-002 is a historical dump consisting of a mixed redeposit of historical and modern refuse along with disused farm equipment. Site 36052-S-003 is a low-density prehistoric lithic and shell scatter consisting of approximately 30 Monterey chert flakes and three marine shell fragments. The isolated artifacts identified include seven prehistoric isolates. The three archaeological sites have not been evaluated for listing in the California Register of Historical Resources (CRHR). The seven prehistoric isolates lack context and are therefore recommended ineligible for listing in the CRHR.

The built environment resources include the Johnson House (2965 Union Road), 3310 Union Road, 3510 Union Road, 3570 Union Road, 4374 Union Road, and an existing 70 kV Power Line. One resource, the Johnson House (2965 Union Road) is recommended eligible for listing in the CRHR. The remaining five built environment resources were evaluated and are recommended ineligible for listing in the CRHR.

1 INTRODUCTION

Pacific Gas and Electric Company (PG&E) proposes to construct a new approximately 7-mile double-circuit 70 kilovolt (kV) power line and reconductor approximately 3 miles of existing power line in the Paso Robles area of San Luis Obispo County, California (Figure 1). PG&E is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by PG&E and NextEra Energy Transmission West, LLC.

This Cultural Resources Technical Report (CRTR) was prepared to document the existing cultural resources in the vicinity of the power line portions of the project. This report describes the methodologies used to document the cultural resources identified and presents the results of those investigations. A similar report has been prepared for the substation component of the project, referred to as Estrella Substation, and the results of that effort are presented under separate cover.

This report refers to several different areas associated with the power line, as defined below:

- **Study Area:** Area comprising the Archaeological Survey Area (ASA) and Built Environment Survey Area (BESA).
    - **Archaeological Survey Area:** Area subject to pedestrian survey for archaeological resources.
    - **Built Environment Survey Area:** Area for which impacts on historical resources were considered.

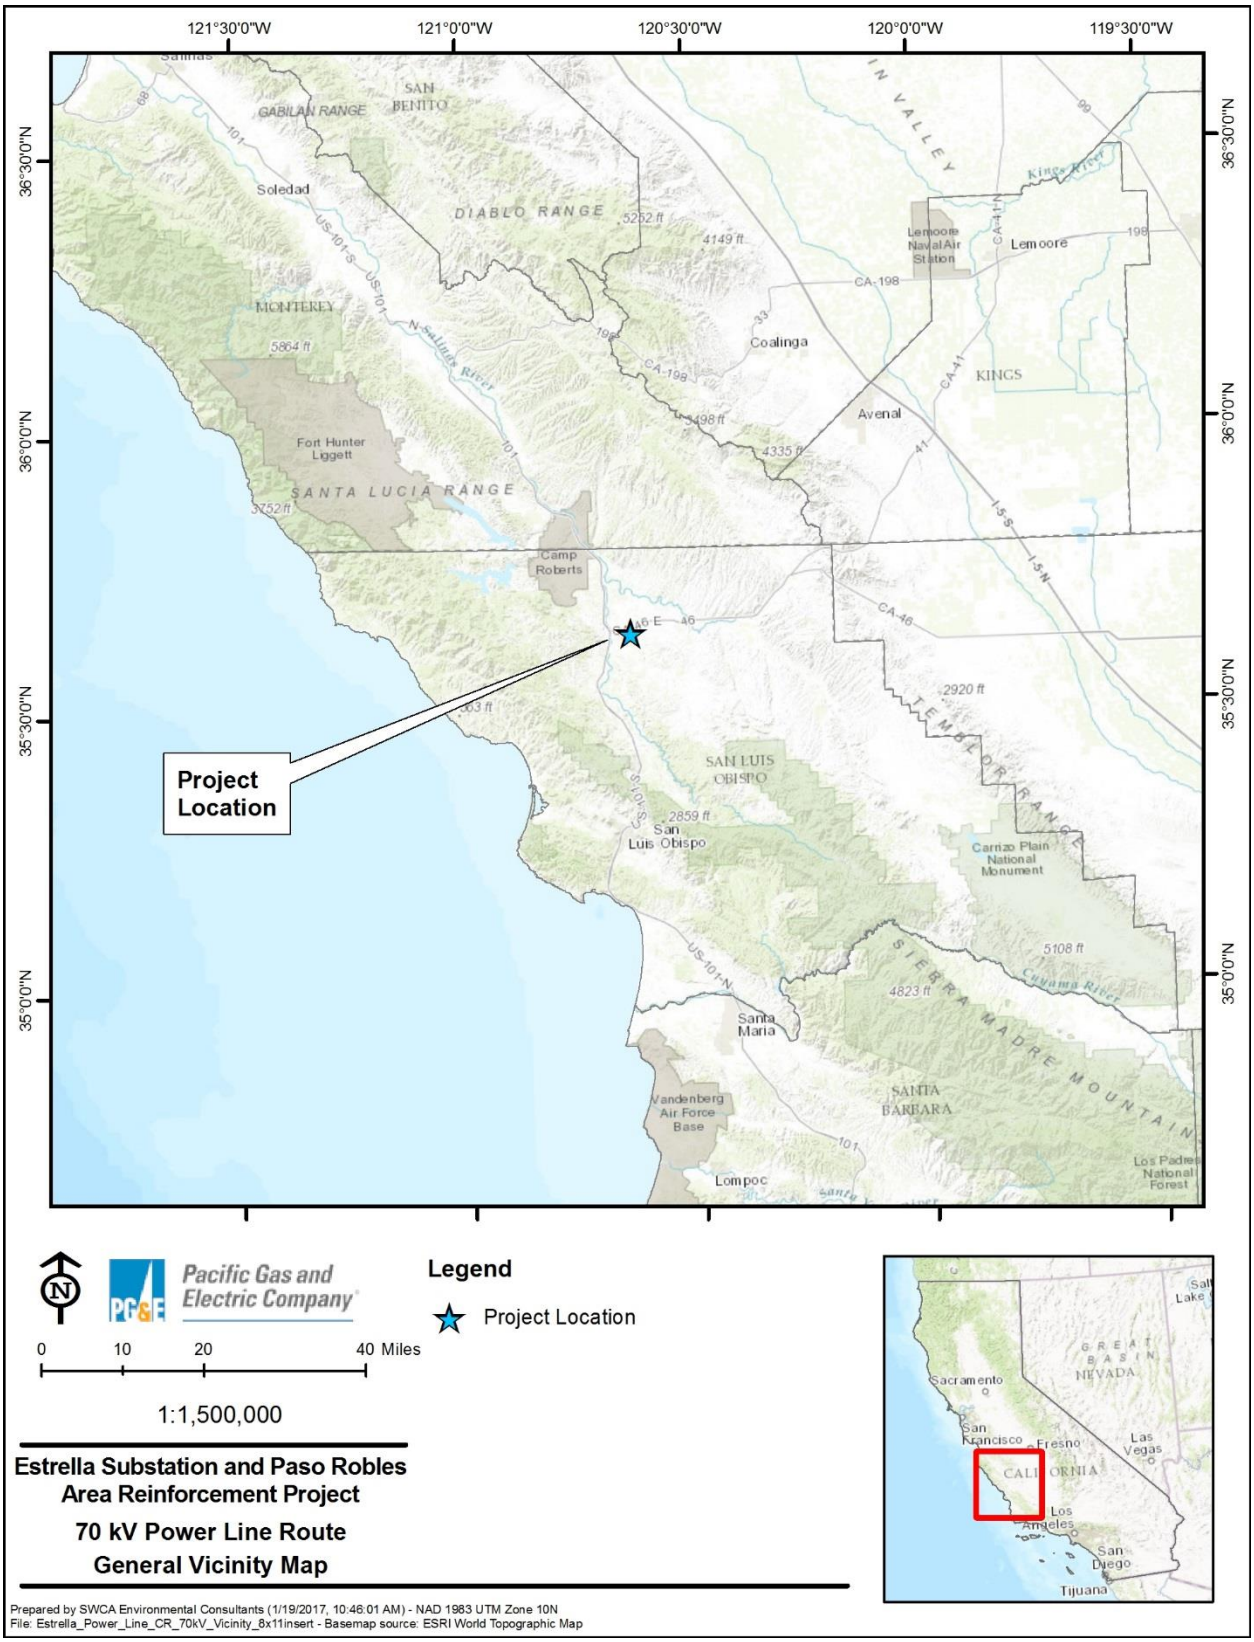
1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The power line consists of a new, approximately 7-mile-long 70 kV power line between Estrella Substation and an existing 70 kV power line (new power line segment) and the reconductoring of approximately 3 miles of the existing line from the point of connection to Paso Robles Substation (reconductoring segment).

1.2 Project Component

The 70 kV power line will use a combination of tubular steel poles and light-duty steel poles. A common neutral will be collocated along the entire length from Estrella Substation to Paso Robles Substation. A fiber optic line for communication services will be installed on the 70 kV power line to provide a fiber optic link between Estrella Substation and Paso Robles Substation. In locations where existing distribution lines are located in close proximity to the power line alignment, the distribution conductors may be collocated on the power line structures.

Figure 1. Project Vicinity Map



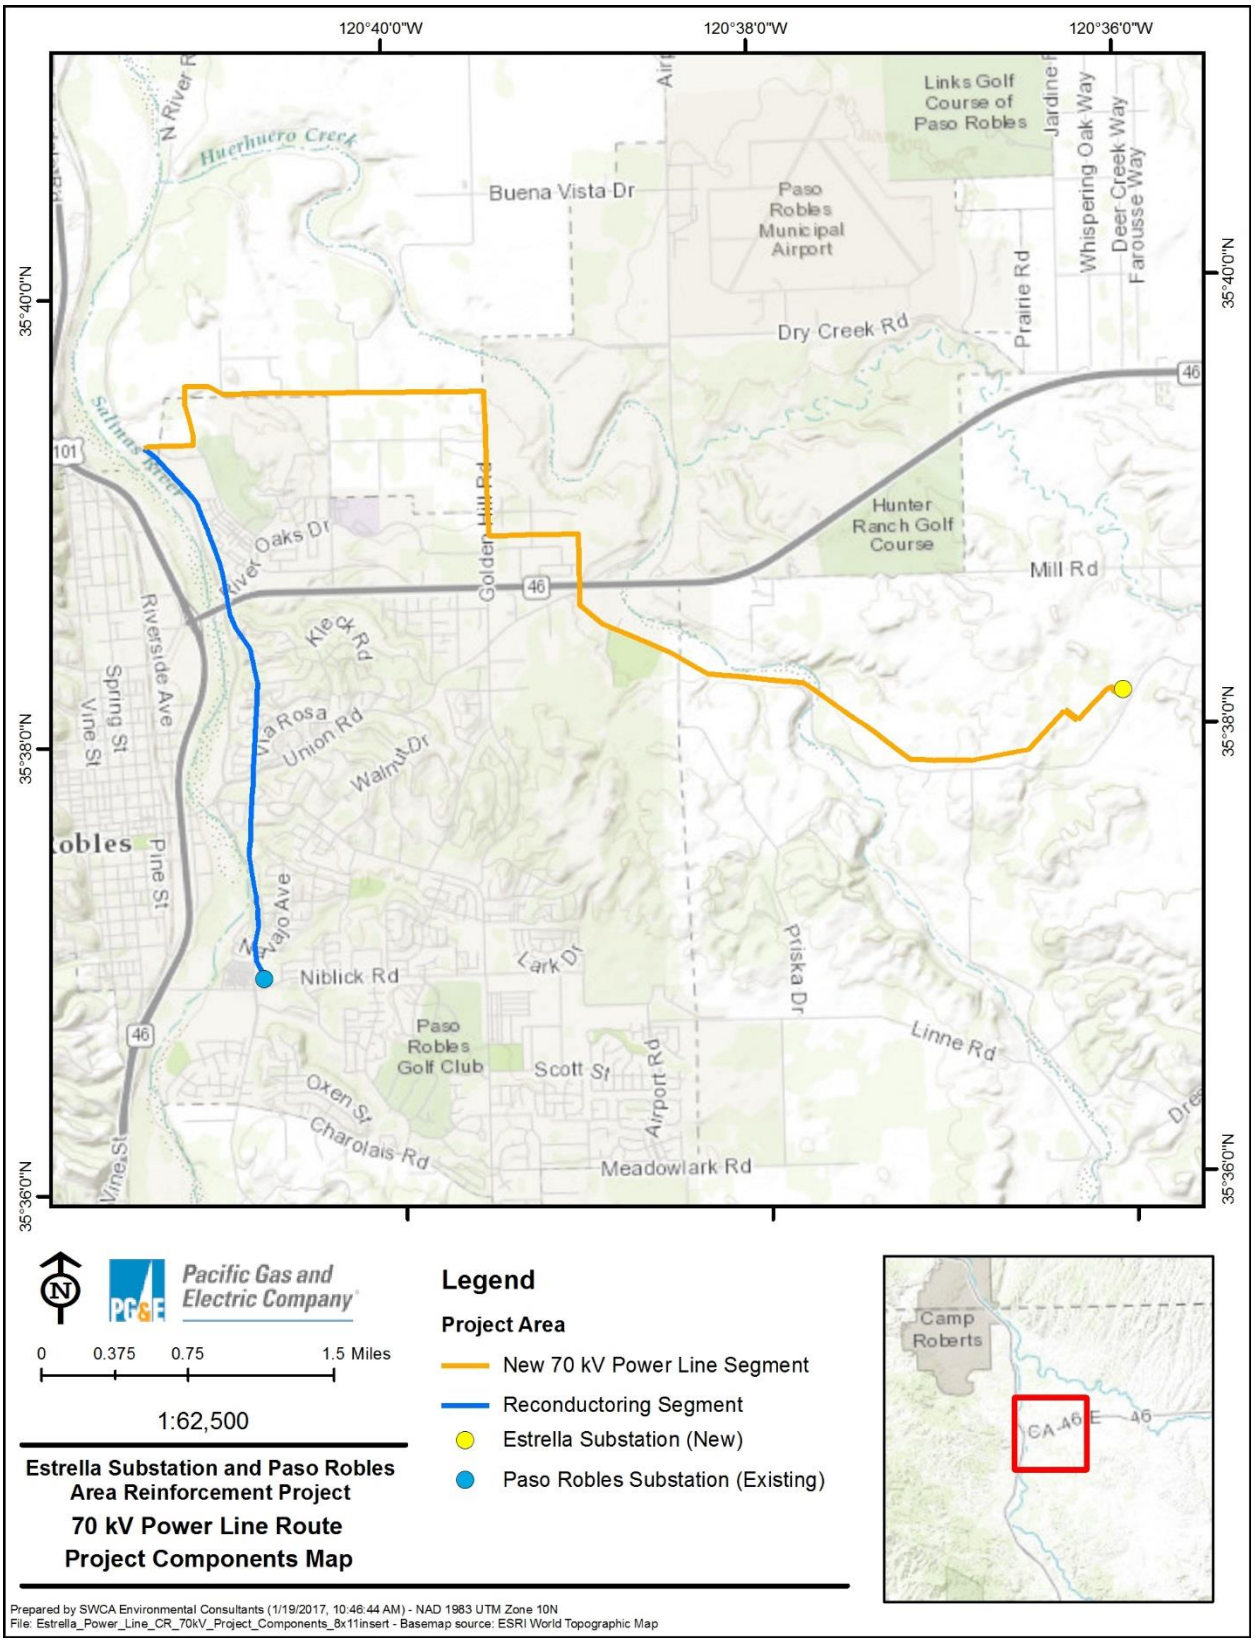


Figure 2. Project Components Map

2 REGULATORY BACKGROUND

2.1 Federal

A federal agency is not approving, implementing, or funding the project or any element of it; therefore, Section 106 of the National Historic Preservation Act (NHPA) and the Paleontological Resources Preservation Act do not apply to this project.

2.2 State

2.2.1 California Register of Historical Resources

Under Section 21083.2 of CEQA, an important archaeological or historical resource is an object, artifact, structure, or site that is listed on, or eligible for listing on, the California Register of Historical Resources (CRHR). Eligible resources are those that can be clearly shown to meet any of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Is associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Automatic listings include properties that are listed on the National Register of Historic Places (NRHP). In addition, Points of Historical Interest nominated from January 1998 onward are to be jointly listed as Points of Historical Interest and in the CRHR.

Resources listed in a local historic register or deemed significant in a historical resources survey, as provided under PRC Section 5024.1(g), are presumed to be historically or culturally significant unless the preponderance of evidence demonstrates that they are not. A resource that is not listed on or determined to be ineligible for listing on the CRHR, not included in a local register of historical resources, or not deemed significant in a historical resources survey may nonetheless be historically significant, as determined by the lead agency (PRC Sections 21084.1 and 21098.1).

2.2.2 Assembly Bill 52

Assembly Bill 52 (AB 52) established that Tribal Cultural Resources (TCR) must be considered by the lead agency under CEQA and also provided for additional Native American consultation requirements to be undertaken by the lead agency. A TCR is a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe, and is:

1. On the CRHR or a local historic register;
2. Eligible for the CRHR or a local historic register; or
3. The lead agency determines that the resource meets the register criteria.

A project that has potential to impact a TCR such that it would cause a substantial adverse change constitutes a significant effect on the environment unless mitigation reduces such effects to a less-than-

significant level. The Governor's Office of Planning and Research has issued revised CEQA Guidelines to incorporate AB 52 requirements.

Under AB 52, California Public Utilities Commission (CPUC) will conduct consultations with eligible tribes regarding TCRs once the Preliminary Environmental Assessment application is deemed complete and CPUC begins CEQA review of the project

2.2.3 California Health and Safety Code and Public Resources Code

Broad provisions for the protection of Native American cultural resources are contained in the California Health and Safety Code, Division 7, Part 2, Chapter 5 (Sections 8010 through 8030).

Several provisions of the PRC also govern archaeological finds of human remains and associated objects. Procedures are detailed under PRC Section 5097.98 through 5097.996 for actions to be taken whenever Native American remains are discovered. Furthermore, Section 7050.5 of the California Health and Safety Code states that any person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes human remains in or from any location other than a dedicated cemetery without authority of law is guilty of a misdemeanor, except as provided in Section 5097.99 of the PRC. Any person removing human remains without authority of law or written permission of the person or persons having the right to control the remains under PRC Section 7100 has committed a public offense that is punishable by imprisonment.

PRC Chapter 1.7, Section 5097.5/5097.9 (Stats. 1965, c. 1136, p. 2792), entitled *Archaeological, Paleontological, and Historical Sites*, defines any unauthorized disturbance or removal of a fossil site or remains on public land as a misdemeanor and specifies that state agencies may undertake surveys, excavations, or other operations as necessary on state lands to preserve or record paleontological resources.

2.3 Local

Because CPUC has exclusive jurisdiction over project siting, design, and construction, the project is not subject to local discretionary regulations. The following description of regulations that designate local historic resources is provided for informational purposes and to assist with CEQA review.

2.3.1 City of El Paso de Robles General Plan

Historic preservation is addressed in the *Land Use*, *Conservation*, and *Housing Elements* of the *City of El Paso de Robles General Plan*. Some of the policies and procedures specifically address historic preservation and the treatment of historic buildings, while others are important considerations to the overall character and appearance of historic properties and neighborhoods or can be used to encourage preservation practices. The *Conservation Element* includes goals, policies, and action items that strive to preserve and protect the city's important historic and archaeological resources. The *Conservation Element* requires the protection of cultural resources by implementing the Downtown Design Guidelines and establishing a Vine Street Historic and Architectural Preservation Overlay District.

2.3.2 City of El Paso de Robles Zoning Ordinance

The City of El Paso de Robles' (City) *Zoning Ordinance* Chapter 21.15 contains the Historical and Architectural Overlay (HP) District rules. It is the intent of the HP overlay district to encourage the preservation, restoration, and renovation of buildings and/or neighborhoods of architectural significance or interest. Paso Robles currently has an HP District bordered by Chestnut Street, Oak Street, 8th Street, and 21st Street, inclusive of both sides of these streets. This overlay zone is referred to as the Vine Street Overlay Zone and/or the Westside Historic District in City documents.

3 PROJECT SETTING

3.1 Environmental Setting

The project area is at an elevation of approximately 700 feet to 984 feet above mean sea level in the southern Salinas Valley, bounded on the west by the Santa Lucia Range and Salinas River, on the east by the Temblor Range, on the north by Estrella River, and on the south by Neal and Sulphur Springs. The Santa Lucia Range is a 140-mile segment of the Outer South California Coast Ranges, extending from Carmel Bay in Monterey County to Cuyama River in San Luis Obispo County (Duvall 2004). The often rugged topography is typical of the Coast Range, with tall parallel peaks giving way to gradual rolling hills and riverside terraces, and slow-moving rivers and creeks meandering through its numerous valleys. In the immediate vicinity of the project area, there are two primary drainages, Huerhuero Creek and Estrella River, both tributaries to Salinas River. Dry Creek, an ephemeral tributary to Huerhuero Creek, passes approximately 1,500 feet to the north of the study area. The Salinas River extends for 170 miles, draining a total surface area of 3,955 square miles and making up the largest river system on the Central Coast of California. The original course of Salinas River, and some of its tributaries, were altered historically to support farming and agricultural efforts, as well as to provide drinking water to the city of San Luis Obispo (Stevens et al. 2004; Funk and Morales 2002). Groundwater is still pumped and much of its waters upstream remain dammed. These impacts have largely reduced the river to a dry creek, except during periods of heavy rain (Palmer 2012).

The project area is located in urban and rural residential developments, agricultural areas dominated by vineyards, and light industrial and commercial developments with patches of native vegetation. The native plant community adjacent to the project area is blue oak woodlands. Blue oak woodlands are typically dominated by large stands of blue oak (*Quercus douglasii*) trees, or a mixture of blue oak trees and valley oak (*Quercus lobata*) trees with an understory of native and nonnative grasses and forbs. Dense groves of California sycamore (*Platanus racemosa*), black cottonwood (*Populus trichocarpa*), and black willow (*Salix nigra*) flourish along the riparian corridors of Salinas River (Palmer 2012). Blue oak woodlands are characterized by upland valleys with gentle to steep slopes. Soils within blue oak woodland are typically shallow, infertile, and moderately to excessively drained with extensive rock fragments. Soil surfaces may be covered with stones or have interspersed rocky outcrops (Sawyer et al. 2009). Blue oak woodlands may provide nesting or foraging habitat for avian species or may serve as a migration corridor for various wildlife species, such as San Joaquin kit fox (*Vulpes macrotis mutica*). Animals typically present in the vicinity of the project include mule deer (*Odocoileus hemionus*), coyote (*Canis latrans*), and bobcat (*Lynx rufus*). Common animal species observed at the time of the study include western fence lizard (*Sceloporus occidentalis),* red-tailed hawk (*Buteo jamaicensis*), acorn woodpecker (*Melanerpes formicivorus*), western scrub jay (*Aphelocoma californica)*, California thrasher (*Toxostoma redivivum)*, red-winged blackbird (*Agelaius phoeniceus)*, and California ground squirrel (*Spermophilus beecheyi*). Steelhead trout (*Oncorhynchus mykiss*) was abundant in the Salinas River watershed as late as the early 20th century, and is present today in smaller numbers (Funk and Morales 2002).

3.2 Cultural Setting

3.2.1 Prehistoric Overview

California prehistory is divided into three broad temporal periods that reflect similar cultural characteristics throughout the state: Paleoindian Period (ca. 9000–6000 B.C.), Archaic Period (6000 B.C.–A.D. 500), and Emergent Period (A.D. 500–Historic Contact) (Fredrickson 1973, 1974, 1994). The Archaic is further divided into Lower (6000–3000 B.C.), Middle (3000–1000 B.C.), and Upper (1000 B.C.–A.D. 500) Periods. These divisions are generally governed by climatic and environmental variables, such as the drying of pluvial lakes at the transition from the Paleoindian to the Lower Archaic period.

The project area lies in the Central Coast Archaeological Region, which is one of eight arbitrary organizational divisions of the state (Moratto 1984:Figure 1). This region extends southward from Monterey Bay through Big Sur to Morro Bay, and includes southern Santa Cruz and Santa Clara Counties, all of San Benito and Monterey Counties, and most of San Luis Obispo County.

Jones and Ferneau (2002:213) have recently refined existing chronological sequences developed for the Central Coast Region, further subdividing the last 3,000 years into the Early–Middle Transition (1000–600 B.C.), Middle (600 B.C.–AD 1000), Middle–Late Transition (AD 1000-1250), and Late Periods (AD 1250–1769). We rely here on the regional chronological sequence as adapted by Jones and Ferneau (2002). Prehistoric sites found in the vicinity of the project area are typically near creeks and may consist of isolated chert lithics or lithic scatters, ground stone (portable mortars, pestles, bedrock mortars and/or cupules), and/or sparse pockets of midden soils. Habitation sites are seasonally occupied camps and small villages (Glover et al. 1999).

3.2.1.1 PALEOINDIAN PERIOD/PALEO-COASTAL TRADITION (CA. 10,000–6500 B.C.)

Occupation of California's Central Coast Region is estimated to have occurred as early as the terminal Pleistocene/early Holocene, or about 10,000 years ago when sea levels were some 15–20 meters lower than today (Bickel 1978:7). Although there is evidence of occupation of the area during the early Holocene, only a few documented archaeological sites within the Central Coast Region can be assigned to a time period prior to about 6,000 years ago. It is likely that most sites of this period within this region are either beneath today's ocean waters or destroyed by coastal erosion. Estimates place the early Holocene shore in central and southern California at some 10 kilometers farther west of the present coastline (Breschini and Haversat 1991:126). An example of the possible early antiquity of additional Central Coast sites is the evidence for early occupation on two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area about 10,000 years ago (Erlandson 1991:105). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002).

Data from sites during this period indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002), as well as on Pleistocene lakeshores in the now arid lands of southeastern California (Moratto 1984:90–92). A Paleo-Coastal Tradition was proposed to highlight the distinctive marine and littoral focus identified within the central and southern California coastal archaeological record prior to the succeeding Milling Stone Period (Mason and Peterson 1994:57–58; Moratto 1984:104). At coastal sites, there is abundant evidence that marine resources such as fish, sea mammals, and shellfish were exploited during the Paleo-Coastal Tradition.

Few fluted projectile points, diagnostic of the Paleoindian Period, have been recovered from the coastal region, but they usually occur in isolated surface finds (Mills et al. 2005). A fluted point fragment is known from the coastal Santa Barbara Channel area, from site CA-SBA-1951 on the coastal plain (Erlandson 1994:44; Erlandson, et al. 1987). Another fluted point has been reported from Nipomo in San Luis Obispo County (Mills, et al. 2005), one of two surface isolated finds in San Luis Obispo County. The other example is reported to have been discovered, and subsequently reburied, in the Santa Margarita area, but no materials suitable for dating were recovered in association with this point (Mills et al. 2005).

Erlandson and Colten (1991) note that there are some 75 southern and central California coast sites older than 5500 B.C. Breschini and Haversat (1991:126) list a total of eight sites in the Central Coast Region that may be assigned to the early Holocene. Four of the sites are inland, possibly beside a lake or marshy creek, and four sites were likely adjacent to embayments and steep rocky cliffs. At the most northern of the eight

sites, CA-SCR-177, an inland site in Santa Cruz County, stone tools have been found in deposits dating to more than 6,000 years ago (Breschini and Haversat 1991:128–129). The other seven sites are near the southern coastal boundary of San Luis Obispo County, range in age between 7,000–9,000 years old, and contain mostly lithics and shellfish remains.

Large side-notched points of the Central Coast Stemmed series in this region date to as early as 8,000 years ago (Justice 2002). Points of this type have been recovered at Diablo Canyon (CA-SLO-2; Greenwood 1972), Cross Creek (CA-SLO-1797; Fitzgerald 2000), Little Pico Creek (CA-SLO-175; Jones and Waugh 1995), and the Honda Beach site (CA-SBA-530; Glassow 1997), among others.

Several recently investigated sites also provide clear evidence for occupation within the Central Coast Region during the Paleo-Coastal Tradition. CA-SLO-1764 (Lebow et al. 2001) and Cross Creek (CA-SLO-1797; Fitzgerald 2000), both near Santa Margarita in San Luis Obispo County, and CA-SLO-832 (Jones et al. 2001) near Pismo Beach, have produced radiocarbon dates from approximately 9,000 years ago (Jones and Ferneau 2002).

3.2.1.2 MILLING STONE PERIOD (CA. 6500–3500 B.C.)

The Milling Stone Period, initially defined by Wallace (1955, 1978) is characterized by an ecological adaptation to collecting, and by the dominance of the principal ground stone implements generally associated with the horizontal motion of grinding small seeds, namely milling stones (metates, slabs) and hand stones (manos, mullers), which are typically shaped. Milling stones occur in large numbers for the first time, and are even more numerous near the end of this period. The Milling Stone Period is also defined by large, simple core and flake tools, and large side-notched projectile points. As testified by their toolkits and shell middens in coastal sites, people during this period practiced a mixed food procurement strategy. Subsistence patterns varied somewhat as groups became better adapted to their regional or local environments.

Milling Stone Period sites are common in both coastal and inland settings in central and southern coastal California, dating as early as 8,500 years ago. The Milling Stone Period is roughly correspondent with King's (1981, 1990) Early Period of the Santa Barbara Channel area, although King's Early Period lasts longer (5500–1350 B.C.). The Cross Creek site (CA-SLO-1797) is a Milling Stone Period occupation site in San Luis Obispo that returned radiocarbon dates ranging between 9,500–4,700 years ago (Fitzgerald 2000:58). This appears to be the oldest recorded mainland shell midden site, and the first coastal residential site to yield pre-8,000-year-old dates (calibrated to two-sigma). Four large, side-notched chert projectile points, 12 flaked stone cores, and two *Olivella* shell beads were recovered among the milling slabs and handstones that dominated the artifact assemblage from the site.

Along Central Coast areas, Milling Stone Period sites are common on terraces and knolls, typically set back from the current coastline (Glassow et al. 1988:68; Erlandson 1994:46). The larger sites usually contain extensive midden deposits, possible subterranean house pits, and cemeteries. Most of these sites probably reflect intermittent use over many years of local cultural habitation and resource exploitation. Erlandson has noted that the typical Milling Stone tools are not common on contemporaneous Channel Island sites, possibly reflecting an alternate, insular resource exploitation (Erlandson 1994:47). On the Santa Barbara coastline in the Gaviota Creek environs, Early Holocene evidence has been identified at CA-SBA-97 by Stephen Bowers (Erlandson 1994:39), and at nearby CA-SBA-96 by D.B. Rogers (1929:256; Erlandson 1994:40).

The Scotts Valley site (CA-SCR-177) in Santa Cruz County and CA-SCL-178 in Santa Clara County may provide evidence for early Holocene activities in the broader region (Cartier 1982:229, 1993; but see Moratto 1984:109–110 and Erlandson 1994:242–245 for critical review). Although the Scotts Valley site

was not excavated in a manner that allows for accurate reconstruction of intrasite stratigraphy, the stone tool assemblage and obtained radiocarbon dates do appear to correlate with the Milling Stone Period (Fenenga 1987).

3.2.1.3 EARLY PERIOD AND EARLY–MIDDLE TRANSITION PERIOD (3500–600 B.C.)

Although Jones and Ferneau (2002:213) have distinguished an Early–Middle Transition Period, it is not well defined. Thus, the transition phase is included in the following discussion of the sites and characteristics recognized for the Early Period in the Central Coast Region.

There is an extensive series of shoreline midden deposits within the Central Coast Region during the Early Period, signifying an increase in occupation of the open coast (Jones 1995; Jones and Waugh 1995, 1997). These include estuarine sites such as CA-SLO-165 in Estero Bay and open-coast sites in the Monterey Bay area, including CA-MNT-73, CA-MNT-108, and CA-MNT-1228. Lithic artifact assemblages from these sites include Central Coast Stemmed Series and side-notched projectile points. Square stemmed and side notched points have also been found in deposits at Willow Creek in Big Sur (CA-MNT-282) and Little Pico II on the San Luis Obispo coast (CA-SLO-175) (Jones and Ferneau 2002).

The material culture recovered from Early Period sites within the Central Coast Region provides evidence for continued exploitation of inland plant and coastal marine resources. Artifacts include milling slabs and handstones, as well as mortars and pestles, used for processing a variety of plant resources. Bipointed bone gorge hooks were used for fishing. Assemblages also include a suite of *Olivella* beads, bone tools, and pendants made from talc schist. Abalone square beads have been found in Monterey Bay, but not yet in the Big Sur or San Luis Obispo areas (Jones and Waugh 1997:122).

Data recovered from Early Period sites in the Central Coast Region indicate marine mammals were more extensively hunted on the Monterey Peninsula as compared to Big Sur (Jones and Waugh 1997:123). At Big Sur sites, terrestrial animals dominate the faunal assemblages. The introduction of the mortar and pestle, as well as the trend toward a decrease in mollusk size seen at some sites (e.g., CA-MNT-1232/H) on the Big Sur coast, indicate resource exploitation had intensified in concert with extended periods of occupation at residential bases.

Shell beads and obsidian are hallmarks of the trade and exchange networks that flourished on the central and southern California coasts. Beginning at the end of the Milling Stone Period, the archaeological record indicates there was a substantial increase in the abundance of obsidian at Early Period sites in the Monterey Bay and San Luis Obispo areas (Jones and Waugh 1997:124–126). Obsidian trade continued to increase during the following Middle Period. At present, not much information is available on shell beads in the Central Coast Region, but it appears there may have been a manufacturing center in the Monterey Bay area at two sites (CA-MNT-108 and CA-MNT-391).

3.2.1.4 MIDDLE PERIOD (600 B.C.–A.D. 1000)

During the Middle Period, there is a pronounced trend toward greater adaptation to regional or local resources. For example, the remains of fish, land mammals, and sea mammals are increasingly abundant and diverse in sites along the California coast. Related chipped stone tools suitable for hunting are more abundant and diversified, suggesting a wider range of specialized tasks, and shell fishhooks become part of the toolkit during this period. Larger knives, a variety of flake scrapers, and drill-like implements are common during this period. Projectile points include large side-notched, stemmed, and lanceolate or leaf-shaped forms. Bone tools, including awls, are more numerous than in the preceding period, and the use of asphaltum adhesive is now common.

Notable introductions included the circular shell fishhooks at the start of the period. The introduction of shell fishhooks and the increased use of other capture devices, such as nets, appear to have led to a substantial focus on fishing in most coastal areas. While seasonal settlement patterns (i.e., use of seasonal camps or temporary resource utilization areas) were still followed, large, permanently occupied settlements, particularly in coastal areas, are also present by the end of the period.

During the Middle Period, residential shell midden sites are fairly common in the Central Coast Region (Jones and Ferneau 2002:213). Well-dated Middle Period sites along the central coast are found at Willow Creek (CA-MNT-281 and CA-MNT-282) in Big Sur, Little Pico Creek (CA-SLO-175, CA-SLO-1259) on the San Luis Obispo coast, and Vierra (CA-MNT-229) in the Monterey Bay area. Artifact assemblages from these sites include large contracting-stemmed projectile points, occasional concave-base points, bone tools, milling slabs and handstones, bowl mortars, pestles, and a suite of *Olivella* bead types (A2, B2b, B2c, and G2) (Jones and Waugh 1995:120; Jones and Ferneau 2002:213). Fishing technology found at these coastal sites includes circular shell fishhooks and bone gorge fishhooks, as well as grooved stone net weights and pitted stones. Plant processing equipment at some of the sites is exclusively bowl mortars and pestles, and handstones and slabs at other sites (Jones and Ferneau 2002:215).

A dietary focus on marine resources during the Middle Period is consistent with the location of most sites on the shoreline (Jones and Ferneau 2002:218). Dense concentrations of fish, including herring, sardine, surfperches, and silversides, have been recovered from sites located alongside estuaries, such as CA-SLO-165 at Morro Bay and CA-MNT-234 at Elkhorn Slough. Rockfish and cabezon are represented at open coast sites, such as CA-SLO-175 and CA-MNT-63. Mammal and bird remains have also been found within Middle Period assemblages, and typically include sea otters, deer, and rabbits.

Although burial populations are fairly limited, burials within residential middens have been recovered at Middle Period sites in San Luis Obispo and Monterey Counties (Jones and Ferneau 2002:217). Most of the burials are primary interments, generally flexed, although some secondary burials have been recovered. There is little evidence of formal cemeteries like those found in the Bay Area to the north. Grave goods include *Olivella* shell saucer beads (type G2), bone tubes and whistles, drilled steatite tube and pebble ornaments, abalone ornaments, bowl mortars, and projectile points.

3.2.1.5 MIDDLE–LATE TRANSITION PERIOD (A.D. 1000–1250)

During the Middle–Late Transition Period within the Central Coast Region, projectile points generally diagnostic of both the Middle and Late Periods co-occur (Jones and Ferneau 2002:217). The points include large contracting-stemmed types found during the Middle Period, plus Late Period small leaf-shaped points, which likely represent the introduction of the bow and arrow. Additionally, hopper mortars are apparently introduced during this transition phase.

This transition period is marked by relative instability and change, with major changes in diet, settlement patterns, and interregional exchange. The relatively ubiquitous Middle Period residential shell midden sites found in this region were abandoned by the end of the transition period, so most Middle–Late Transition Period and Late Period sites were first occupied during those periods (Jones and Ferneau 2002:213, 219). During this transition period, the climate fluctuated between cooler, wetter periods and warmer, drier periods. During cooler, wetter periods, alluvial deposition increased; comparatively little deposition occurred in the drier intervals. Extended periods of relatively little rainfall, referred to as the Medieval Climatic Anomaly, produced droughts across the West between about A.D. 650–850 and A.D. 1150–1250 (Jones et al. 1999). Dry conditions during the Medieval Climatic Anomaly may be related to the abandonment of the coastal shell mound villages as primary residential locations. Settlement strategies were apparently reorganized and focused on a dispersed pattern, with the establishment of both coastal and interior habitation areas, coinciding with the exploitation of seasonally available resources.

Well-dated Middle–Late Transition Period occupation sites include CA-MNT-1233 and CA-MNT-281 in the Big Sur area, CA-MNT-3 in the Monterey Peninsula, and CA-SLO-1796 near Pismo Beach. The period is marked in both the Big Sur and San Luis Obispo areas by unique Cambria double side-notched projectile points, like those recovered from site CA-SLO-175 (Jones and Waugh 1995). Artifact assemblages from Middle–Late Transition Period sites also include bowl mortars, pestles, handstones, and milling slabs, as well as circular fishhooks and stone disks used for fishing. As discussed by Jones and Ferneau (2002:218), two unusual items recovered from CA-MNT-281 and CA-SLO-1796, respectively, include a small-incised slate tablet and a *Megathura* limpet ornament.

Evidence of trade and exchange is also represented in Middle Period sites, particularly in the abundance of obsidian items. Obsidian was obtained from sources from 200 to 400 kilometers away from the Central Coast Region. Obsidian from the Coso volcanic field dominates the Big Sur and San Luis Obispo area sites during this period. In the Monterey Bay area, Casa Diablo obsidian is more prevalent.

Like their Middle Period antecedents, dense concentrations of fish bones have been recovered from Middle–Late Transition Period sites on the open coast (Jones 1995; Jones and Ferneau 2002:219). There is also some indication that residents relied on smaller fauna, including anchovies and rabbits.

The sites at both Little Pico Creek and Willow Creek contain burials, some of which are group interments, with individuals in an extended position (Jones and Ferneau 2002:217–218). In addition to the diagnostic Cambria points, grave goods include several *Olivella* bead types (B2, B3, G2, and K1); *Olivella* G1 saucer beads may be diagnostic of this period.

3.2.1.6 LATE PERIOD (A.D. 1250–HISTORIC CONTACT)

Cultural materials, such as temporally diagnostic shell beads and small, finely worked projectile points, help identify Late Period sites throughout California. The small projectile points are associated with bow and arrow technology. Although shell beads were typical of coastal sites, trade brought many of these maritime artifacts to inland locations, especially during the latter part of the Late Period. The end of the 18th century, when the Spanish mission system had its greatest effect on native Californian populations, is generally agreed upon as the terminal point of the Late Period.

Overall patterns of occupation within the Central Coast Region indicate that sites inhabited during the Middle Period show in most cases little or no evidence of being occupied continuously into the Late Period (Jones and Ferneau 2002:213, 219–220). This holds true for the Monterey Peninsula as well as the Morro Bay areas, although much of the region still lacks a large inventory of well-sampled and well-dated Late Period components. Rare exceptions have been found at one Big Sur site (CA-MNT-376) and two sites on the northern San Luis Obispo coast (CA-SLO-2 and CA-SLO-267).

Unlike the large Middle Period shell middens, Late Period sites are more frequently single-component deposits. There are also more inland sites, with fewer and less visible sites along the Pacific shore during the Late Period. The settlement pattern and dietary reconstructions indicate a lesser reliance on marine resources than observed for the Middle Period and Middle–Late Transition Period, as well as an increased preference for deer and rabbit (Jones 1995). An increase in sites with bedrock mortars during the Late Period further suggests that nuts and seeds began to take on a more significant dietary role.

A well-dated Late Period site along the Big Sur coast, CA-MNT-1223, produced seven radiocarbon dates between A.D. 1220 and 1720 (Jones 1995). The chipped stone tool assemblage includes Desert side-notched and Canaliño projectile points. Shell artifacts include circular fishhooks and *Olivella* beads (types A4, A5, E1a, E1b, and K1). Small steatite disk beads, as well as crude lithic microblades were also recovered from this site. Slab hopper mortars and pestles were the only ground stone artifacts recovered from CA-MNT-1223, although bedrock mortars and crude cobble pestles have been recovered from Late Period sites

located in the inland valleys (Jones and Ferneau 2002:218). Unlike Middle Period site assemblages, obsidian is not common in Late Period deposits (Jones and Ferneau 2002:225).

The microblade/drills recovered from CA-MNT-1223, as well as CA-SLO-214, are likely associated with the production of shell beads. The manufacture of shell beads is associated with the Santa Barbara Channel area, and is not well represented further north. In general, Late Period sites within the Central Coast Region have fewer traits in common with Santa Barbara Channel sites than found during the previous periods (Jones and Ferneau 2002:213).

3.2.2 Ethnographic Overview: Salinan

The project area is in an area traditionally considered by archaeologists to have been prehistorically and ethnohistorically occupied by the Salinan (Hester 1978; Kroeber 1925). Surrounding native groups include the Esselen and Ohlone to the north, the Southern Valley Yokuts to the east, and the Chumash to the south. However, recent research illustrates the uncertainty in the ethnographic record of such sociopolitical and linguistic boundaries. Gibson (1983:181–182) considers the Paso Robles area to be within the northern extent of the Chumash. This would place the project area just beyond the southeastern boundary of the Salinan language area (Rivers and Jones 1993:147). Milliken and Johnson's research (2005:128), based on ethnographic and linguistic data, suggests that the project area lies within the Salinan language area, but just east of the Chumash-Salinan boundary zone. The project area lies within the ethnographic boundaries of a Salinan sub-group known as the Migueleño. Known ethnographic village sites near the project area are *him'-se-en'* between Paso Robles and Templeton on the west side of Salinas River, and a major village at *isolam* near the present-day community of Cholame (Hester 1978:500–501). Gibson (1983:180) additionally plots the tentative locations of the rancherias of *tixja* and *sososquiquia* in the vicinity of the project area. Jones et al. (2007) note the possible ethnonym of *Etsmal* for the tribal group in this area.

The Salinan language generally has been regarded as part of Hokan linguistic stock (Hester 1978:500; Shipley 1978:86), but more recent linguistic analysis indicates Salinan has no close relatives and no demonstrated connections to other languages (Mithun 2001:482). Mason (1918) recorded two Salinan dialects, northern (Antoniaño) and southern (Migueleño) divisions, associated with the people administered by the Spanish from Mission San Antonio de Padua and Mission San Miguel, established in l771 and 1797, respectively. Neophytes at the Mission San Antonio included Salinan living along the coast, referred to as "Playanos."

The semi-sedentary Salinan occupied a rugged, mountainous area on the south-central California coast (Kroeber 1925; Hester 1978). Heavily wooded hills and mountains of the South Coast Ranges dominated the interior, with sheer cliffs and rocky beaches along the Pacific coast. Salinan villages were recorded near the missions and along internal drainages, with some habitation areas along the coast (Hester 1978:501). No permanent sites were recorded in the Coast Range, although temporary camps were likely. Their subsistence economy was one of hunting and gathering. The surrounding environment was varied and rich, and they exploited the mountains, foothills, valleys, and coast. As with most native Californians, acorns were a staple food, supplemented by wild oats, sage seeds, berries, mescal, and wild fruits. Additional resources exploited by coastal and interior groups included large and small mammals such as deer, bear, and rabbits, as well as fish. The full extent of their villages is unknown, but Hester (1978:501) locates 21 from earlier records.

Salinan houses were domed, up to 10 feet square, constructed of poles, and covered with tule or rye grass (Hester 1978:501). Other structures included birthing huts, dance houses, and semisubterranean sweathouses, among additional communal structures. Acorns were stored in willow-twig granaries. The Antoniaño group practiced cremation of their most distinguished individuals. Among the Migueleño, the deceased were wrapped in skins and their possessions burned.

A variety of tools and implements, some of which are inferred from the archaeological record in the area, were employed by Salinan groups (Hester 1978:501). These included bows and arrows, traps, nets, blinds, slings, spears, harpoons, and hooks. Bone and shell tools included bone awls and C-shaped shell fishhooks. Foods were processed using stone mortars and pestles, metates, basket mortars, bedrock mortars, stone bowls, and wooden mortars. The Salinan also made a wide variety of baskets. Cooking baskets and earth ovens were used in food preparation.

There is little recorded of Salinan subsistence economy by enthnographers, but they would have taken full advantage of the plant and animals resources available in the river valley, foothills, and mountains within their territory. They also had a stretch of coastline from which to gather shellfish, fish, and marine mammals.

Ornaments included items made of steatite, serpentine, and abalone shell. Clothing included basket hats, rabbitskin or otterskin cloaks, and tule aprons. The Salinan also used beads made from mussel and abalone shell for currency and had musical instruments, such as cocoon rattles, wooden flutes, and bone whistles.

Some of Salinan material culture was obtained through an important trade network, established with neighboring groups (Hester 1978:500–501). In exchange for saltgrass salt, obsidian, seeds, lake fish, and possibly tanned animal skins, Salinan groups traded shell and shell beads with the Yokuts to the east. Shell ornaments, wooden dishes, and steatite vessels were obtained from the Chumash to the south, but apparently, the Salinan did not trade with a rival trade group, the Costanoan to the north.

Like other indigenous Californians living near the coastal missions, Salinan population decreased rapidly after the arrival of the Spanish. A relatively small population to begin with, the Salinan were decimated by diseases introduced by the missions and later settlers. By 1831, their number was fewer than 700, and their population continued to decrease even more rapidly after secularization of the missions (Hester 1978:503). By the turn of the 20th century, only three families survived within their traditional territory. The California Indian Roll of 1928 registered only 36 Salinans, and research 5 years later could only locate one Antoniaño family, comprised of four elderly siblings (Hester 1978:503).

3.2.3 Historical Overview

Post-contact history for the state of California generally is divided into three specific periods: the Spanish Period (1769–1822), the Mexican Period (1822–1848), and the American Period (1848–present). Although there were brief visits by Spanish, Russian, and British explorers from 1529–1769, the Spanish first settled California in 1769 with the first of 21 missions established from 1769–1823. The Mexican Period is marked by an extensive era of land grants, most of which were in the interior of the state, and by exploration by American fur trappers west of the Sierra Nevada Mountains.

With the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican-American War, California became a territory of the United States. The discovery of gold in 1848 at Sutter's Mill and the resulting Gold Rush era influenced the history of the state and the nation. The rush of tens of thousands of people to the gold fields also had a devastating impact on the lives of indigenous Californians, with the introduction and concentration of diseases, the loss of land and territory (including traditional hunting and gathering locales), violence, malnutrition, and starvation. Thousands of settlers and immigrants continued to pour into the state, particularly after the completion of the transcontinental railroad in 1869.

With continued growth, California continues to be a national leader in agriculture and poultry production, ranching (cattle and sheep), aerospace and communications industries, as well as the film and entertainment business. The wealth of California's natural resources (e.g., lumber, petroleum deposits, minerals, fish) also continues to contribute to its growth and development.

3.2.3.1 SPANISH PERIOD (1769–1822)

Spanish explorers made sailing expeditions along the coast of California between the mid-1500s and mid-1700s. In search of the legendary Northwest Passage, Juan Rodríguez Cabrillo sailed up the California coastline. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. The Spanish crown laid claim to California based on the surveys conducted by Cabrillo and Vizcaíno (Bancroft 1885:96–99; Gumprecht 1999:35). European contact in the San Luis Obispo County region may have begun as early as 1587 with the visit of Pedro de Unamuno to Morro Bay, although some scholars have questioned this based on the ambiguity of Unamano's descriptions (Mathes 1968). A visit in 1595 by Sebastian Rodriguez Cermeño is better documented (Jones et al. 1994).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. The earliest well-documented descriptions of the Paso Robles area come from accounts by members of Portolá's land expedition, which passed through the region in 1769 (Squibb 1968). They named the area *El Paseo de Los Robles,* or "The Pass of the Oaks," after seeing the tall oaks that lined the narrow valley of the Salinas River. Permanent Spanish settlement of the region began with the founding of Mission San Antonia de Padua (near King City) in 1771, San Luis Obispo de Tolosa (in San Luis Obispo) in 1772, and Mission San Miguel in 1797. As elsewhere, induction into the missions had a devastating effect on the local inhabitants, requiring them to live and work at the mission and abandon their former lifeways. Under the guidance of the mission fathers, the natives were instructed in farming methods including the production of wheat, beans, and various kinds of fruit. The earliest farming was intended to foster independence for the missions, thus reducing the reliance on imported supplies. The inauguration of Spanish colonization brought about major and devastating changes to aboriginal society, due primarily to the introduction of European diseases. The consequent high mortality rate, and the pressure of overwhelming social change, decimated the population. By 1805, most native villages had been abandoned and the populace had either fled or moved into the mission system (Gibson 1983).

A major emphasis during the Spanish Period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish Period: Los Angeles (1781), San José (1797), and Villa de Branciforte (1797); only San José and Los Angeles were successful and remain as California cities. Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population.

3.2.3.2 MEXICAN PERIOD (1822–1848)

After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants (Dallas 1955:14).

Extensive land grants were established in the interior during the Mexican Period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. When the Mission system was secularized after 1834, the church's land holdings were distributed to private Mexican citizens, including approximately 500,000 acres within San Luis Obispo County. During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export,

providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

3.2.3.3 AMERICAN PERIOD (1848–PRESENT)

War in 1846 between Mexico and the United States precipitated the Battle of Chino, a clash between resident Californios and Americans in the San Bernardino area. The Mexican-American War ended with the Treaty of Guadalupe Hidalgo in 1848, ushering California into its American Period.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. territories (Waugh 2003). During this time, many of the Mexican land grants passed into American ownership, extending the period of prosperity associated with the ranchos (Rivers 2000). Horticulture and livestock, based primarily on cattle as the currency and staple of the rancho system, continued to dominate the southern California economy through 1850s. The Gold Rush commenced in 1848, and with the influx of people seeking gold, cattle were no longer desired mainly for their hides, but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains where available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 2005:102–103).

Roads were constructed throughout the county in the 1870s, primarily by Chinese laborers. In 1872, Captain John Harford began construction on the Pacific Coast Railway, which linked his wharf in the coastal town of Avila with San Luis Obispo. By the time the Southern Pacific Railroad arrived in the 1880s, San Luis Obispo County, as well as the rest of California, was experiencing a significant land boom. The county was described as "the great butter and cheese belt of southern California," with affordable land priced between $18 and $25 per acre (Dumke 1944). By April 1887, an estimated 3,000 to 4,000 people inhabited the region, and land prices increased dramatically. In 1894, the Southern Pacific Railroad completed the line from San Jose to San Luis Obispo.

The advent of rail allowed for agricultural expansion throughout the region. Wine grapes were first introduced to the Paso Robles region by Spanish conquistadors and Franciscan missionaries in 1797. The first commercial winery was established in 1882, by Andrew York, an apple farmer from Indiana. York founded the Ascension Winery on his 240-acre property, which became well-known for their Zinfandel wines (Rice and Cervellone 2007). During the 1920s, other immigrants to the region established vineyards, including the Martinelli, Dusi, and Bianchi vineyards, establishing the region within the wine industry. By the 1940s over a dozen small family-owned wineries had been planted in to the east and west of Salinas River. By the 1980s, large corporate wineries began to plant in the Paso Robles region, and by the 1990s, European winemakers moved to the area to take advantage of the lack of restrictions on wineries. By 2007, the number of wineries had climbed to 170 in the Paso Robles region (Rice and Cervellone 2007).

The lands of Paso Robles were well-suited for farming. After the rancho land grants, the land was subdivided into smaller parcels for individual farming and stock ranching. The area first found farming success with wheat and barley. Orchard crops had been added by the turn of the last century and soon the county expanded in nuts and fruits. In 1912, the first commercial almond orchard was planted (Paso Robles Press 1928) and by 1926, there were 33,000 acres of almond planted (Los Angeles Times 1926). The city

became known as the "City of Almonds" for the abundance of its orchards (Rice and Cervellone 2007). A poor crop in in 1934 saw the decline of almonds and, although they continued to be grown in the vicinity, by the 1980s there were approximately only 100 almond growers in area (Ittner 1987).

The county's success in agriculture and ranching continued throughout the 20th century. The county's agricultural production supplied U.S. troops during World War I and helped its residents weather the Great Depression of the 1930s. At the start of World War II, the U.S. War Department transferred nearly 100,000 military personnel to bases at Camp San Luis, Camp Roberts, Morro Bay, and Cambria. In 1942, the Estrella Army Air Field was established and operated for 2 years. After the closure, the land and buildings were transferred to the County of San Luis Obispo (County) in 1947 to establish the Paso Robles Municipal Airport (Estrella Warbirds Museum 2015).

Today, San Luis Obispo County is an important agricultural area. By 2014, the Paso Robles region included more than 32,000 acres of vineyards and more than 200 wineries (Paso Wine 2016). In addition to wineries, the county's many beaches, state parks, and small-town atmosphere bring tourists from the nation and around the world. Hearst Castle, built by William Randolph Hearst from 1917 to 1947 in San Simeon, is a world-famous tourist attraction along the northern San Luis Obispo County coast, approximately 30 miles west of Paso Robles.

3.2.3.4 CITY OF EL PASO DE ROBLES

The city has historically served as an economic and transportation hub for the rural agricultural area that encompasses the project area. The City of El Paso de Robles (Spanish for "the pass of oaks," today often called simply Paso Robles) is situated on the former lands of the Rancho Paso de Robles. Once an outpost of the Mission San Miguel, the 25,993-acre rancho was granted to Pedro Navarez in 1844. In 1857, Rios sold the rancho to a partnership consisting of Daniel and James Blackburn and Lazare Godchaux (Hoover et al. 2002). The rancho lands were subsequently divided up, with the present-day city boundaries falling under the holdings of the Blackburn brothers and brother-in-law, Drury James, who purchased Godchaux's interest in the rancho (Bowler 2003). In 1886, Blackburn and James laid out a plan to subdivide lots surrounding the hotel and establish the town of Paso Robles. It was the goal of Blackburn and James to establish a town site that would be the most important stop between San Francisco and Los Angeles.

The Southern Pacific Railroad arrived in October 1886, marking an important turning point in the development of Paso Robles. Rail transportation gave the town the opportunity to expand significantly, opening the resort to people previously unable to endure long stagecoach rides. Additionally, the arrival of the railroad allowed the town to expand its farming operations for long-distance shipping of crops, livestock, and byproducts (Bowler 2003). The region was particularly suited for growing almonds, walnuts, and grapes. In the late 19th and early 20th centuries, European settlers planted vineyards and established the wine industry as a major component of the regional economy (Historic Resources Group 2010:17–18). By the 1940s, the population of El Paso de Robles had soared to over 3,000 residents and it was recognized as a resort community, attracting tourists from all over the world. Since the 1950s, the city has continued to expand and grow its population, while maintaining a diverse economy that includes agriculture and industry.

3.2.3.5 EAST OF PASO ROBLES: RANCHO SANTA YSABEL, HUERHUERO CREEK, DRY CREEK, AND THE ESTRELLA RIVER

The project area is in an area east of Salinas River that has been used for ranching and agriculture since the Mission period. Small settlements along Huerhuero/Dry Creek and Estrella River developed slowly throughout the 19th century, and expanded more rapidly in the 20th century along with mechanized agriculture. Trails and roads in the area have historically served to convey people and commodities between the Central Valley, Salinas River, and maritime towns on the Pacific Ocean.

In 1844, the former mission land of Rancho Santa Ysabel was granted to Lieutenant Francisco Casimiro Arce by Governor Manuel Micheltorena. This land grant encompassed a 4-square-league tract of land on the eastern bank of Salinas River, opposite Rancho Paso de Robles (Gudde and Bright 1998:350; Hoffman 1862:A49). On June 10, 1846, Arce's contingent of the Mexican army was defeated by Ezekiel Merritt and other American settlers near Elk Grove, which emboldened the American insurgents to take Sonoma in the Bear Flag Revolt on June 14, 1846 (Kyle et al. 2002:306). Arce filed a claim to Rancho Santa Ysabel following the Mexican-American War, and was granted a patent in 1866 (State-Surveyor General 1886:17).

Rancho Santa Ysabel was purchased in 1886 by Chauncey Hatch Phillips' West Coast Land Company along with parts of Rancho Paso Robles and Rancho Huer-Huero to the south (Storke 1891:157). This purchase was later developed into present-day parts of Paso Robles and Templeton. In 1891, Santa Ysabel and this area east of the Salinas River was described as a fertile landscape for agriculture and ranching:

> *The Santa Ysabel consists of 20,200 acres, adjoining the Rancho Paso de Robles at the northeast. For ten miles the Southern Pacific Railway runs along and within one-fourth mile of its boundary. It is covered with white and live-oak timber, although less thickly than the Paso de Robles. There are, substantially, 16,000 acres of plow land, the rest fruit and grazing land. The soil is rich and deep, and will produce wheat of the finest, barley, oats, corn, all fruits and vines, and olives. Wine and raisin-making will no doubt, be important industries of this section. On this rancho are twenty miles of running water, besides numerous living springs. Well water is had at ten to forty feet deep.* (Storke 1891:162)

By the 1860s, General Land Office survey plats show a sparse network of roads and trails connecting El Camino Real at Paso Robles and Mission San Miguel with Rancho Santa Ysabel and settlements to the east in the vicinity of present-day Shimmin's Canyon Road and Cholame, and which continue over the Temblor Range to Tulare Lake and the Central Valley. This early system of trails and wagon roads likely followed previous paths and fords established by the Migueleño as they travelled between villages and hot springs at the Salinas River and Cholame, and on seasonal resource-gathering migrations to the oak woodland uplands. Indeed, mission records document kinship ties between the village at Cholame and the rancheria of *assii*, near present-day Lockwood (Gibson 1983:182).

Segments of the present Union Road are plotted on 1869 General Land Office survey plats. This road appears to have originated at Rancho Santa Ysabel to the southwest, and possibly connected to the "*camina*" (road) roughly depicted on the Rancho Santa Ysabel diseño as connecting with El Camino Real in the vicinity of Rancho Paso de Robles on the western bank of Salinas River (University of California [U.C.] Berkeley 184-[?]). The historical alignment of Union Road plotted on the survey plat parallels another east-west road to the south, which is labeled "Trail from San Luis Obispo to Cholame Ranch," and both roads appear to have connected with San Miguel Road (approximate alignment of State Route (SR)-46) to the east. An 1858 survey plat notes a spring, wheat field, "Indian cabins," and "Indian hut" at the intersection of SR-46 and Shimmin's Canyon Road. SR-46 continues east to the town and ethnographic village site of Cholame, and over the Temblor Range to Tulare Lake and the Central Valley.

The 1919 Paso Robles U.S. Geological Survey (USGS) 15-minute Quadrangle shows further development of this network of roads, which by then connected the well-developed city of Paso Robles, El Camino Real, the Southern Pacific Railroad, and the Salinas River to the west with the small settlements of Estrella, Bern, Union, Shandon, and Geneseo. At this time, rural residences were sparsely distributed along the roadways, leaving the landscape for ranching and agricultural uses. Several schools were in operation, including Dry Creek School, Estrella School, Phillips School, and Pleasant Valley School.

The Paso Robles Municipal Airport was originally built in 1942 for military use during World War II. It was taken over by the County in 1949, and was transferred to the City in 1973 (City of El Paso de Robles 2016a).

By 1948, the USGS 7.5-minute Quadrangle shows much of the early road network incorporated into the modern county and state highway system, including the present alignments of SR-46, Union Road (former SR-41), Mill Road, and Estrella Road. Orchard and field croplands were present along Union Road at this time, while most of the surrounding lands were open space likely used for livestock grazing. While almonds, fruit, and field crops remain important agricultural products of the region, wine grapes were increasingly planted in the mid- and late-20th century. Hunter Ranch Golf Course was built in the early 1990s.

3.2.4 Significant Themes

The following sections present significant themes relating to the types of resources identified within the project area. This includes discussions of residential development in Paso Robles and the surrounding area, the role of agriculture and wine grape cultivation, and the development of electric generation and transmission in San Luis Obispo County.

3.2.4.1 RESIDENTIAL DEVELOPMENT

The following section is largely paraphrased from *City of Paso Robles Historic Resources Survey* (Historic Resources Group 2010). With the establishment and growth of Paso Robles in the 1880s, residential development in the region primarily centered on the city's emerging city core west of Salinas River, while development east of the river was much more dispersed and consisted of small, family-run farms grouped in agricultural communities such as Linne, Shandon, and Cholame. Although the arrival of the Pacific Coast Railway and Southern Pacific Road's coastal route in 1886 encouraged a number of well-advertised land auctions and subdivisions, it did little to immediately increase growth in the region. Census records indicate the population in San Luis Obispo County only increased by 565 people between 1890 and 1900, and many of the tracts of land that were subdivided along the rail line remained undeveloped into the following decades.

While residences in the Paso Robles area that were constructed in the 1880s and 1890s were typically designed in Victorian-era styles, homes developed in the first decades of the 20th century reflected new regional styles that were emerging across California. Most notable was the California bungalow, which was inspired by the Arts and Crafts movement and was well suited for the region. It remained the dominant style in the Paso Robles through the 1920s, with a lesser number of Spanish and Mediterranean revival styles also constructed during this period. Residential construction comprised the majority of construction in the 1910s and 1920s and continued to be located primarily west of Salinas River. Similar to much of California and the rest of the country, residential development in Paso Robles slowed significantly during the Great Depression of the 1930s. In 1934, the Federal Housing Administration (FHA) was created as a result of the National Housing Act and provided financial incentives and guidelines for the construction of new homes. These guidelines promoted 624-square-foot, efficiently designed houses and outlined concepts of planning for parks, playgrounds, and commercial areas. An example of an FHA planned development in the northern edge of Paso Robles is the Oak Park neighborhood, which was developed in 1941. Other residential architecture from the 1940s remained primarily to the west of Salinas River and consisted of infill housing in previously-established neighborhoods.

Development eventually began to move east of Salinas River following World War II. While this area had continued to remain largely agricultural up to this point, a large population influx and the construction of two new bridges crossing Salinas River soon resulted in an increase of development adjacent to U.S. Highway 101. By the end of the 1950s, much of the original Santa Ysbel Land Grant had been developed and eight new subdivisions were annexed by the City. Architectural styles within these subdivisions were

consistent with popular designs of the time and typically consisted of Ranch- and Modern-style homes. Agricultural lands east of Salinas River continued to be subdivided and annexed in the following decade, with another six subdivisions added between 1960 and 1969. Development since this time has remained largely focused on the areas bordering Salinas River and the highway, with areas further to the east continuing to be characterized by agricultural uses.

3.2.4.2 AGRICULTURAL DEVELOPMENT

City of Paso Robles Historic Resources Survey (Historic Resources Group 2010) provides a thorough discussion of the significant role of agriculture and wine grape cultivation in the Paso Robles area and is excerpted below:

> *Agriculture is the main commercial enterprise in San Luis Obispo County, and is critical to the economy and development of Paso Robles. During the late nineteenth century dairy, cattle, and horse ranches were established in the region. The most significant crops during this period were the grain crops, primarily wheat and barley. Paso Robles became the commercial capital of a regional economy based on the export of wheat in the 1880s and 1890s.*
>
> *The goal for many farmers, however, was to slowly increase the size of their orchards and eventually replace wheat altogether. The long-term attraction of orchard crops was their much higher profit yields, as one acre of fruit will yield more profit than fifteen acres of wheat. They were successful in this venture, and between 1870 and 1910 California agriculture underwent a momentous transition in which specialty crops (primarily fruits, nuts, raisins, and wine grapes) completely eclipsed grain production. The transition required time and money since fruit trees usually do not come into full bearing until four or five years after planting. In the interim, wheat provided income enabling farmers to support their families and nurture their trees. In addition, the local infrastructure needed to adapt to the new requirements of orchard farming, including the necessity for professional nurseries, driers, and canneries.*
>
> *During this period, the almond began to emerge as one of the most successful orchard products for Paso Robles. The mixture of sand, clay, and silt in the soil provided good drainage, and the average rainfall of the area created the ideal climate for non-irrigated almond orchards. Michael Gerst, a prominent Paso Robles pioneer, was a homesteader on land subdivided near the rail lines in the 1880s in the Oak Flat district west of Paso Robles. He established several acres of fruit and nut orchards. The almond grew so successfully for him that at the 1906 World's Fair Gerst took the prize for "the best almonds in the world." In the 1920s Paso Robles would become the "Almond Capitol," having the largest concentration of almond orchards in the country…*
>
> *… The economic growth of the 1870s and 1880s led first to the establishment of the Grange, which was the country's first nationwide agricultural organization and was based on the principles of fraternal institutions. In addition, the related ideals of the Scandinavian Folk School Movement, which was transplanted to the United States by Norwegian, Swedish, and especially Danish immigrants who settled in the Midwest and along the Pacific Coast during the second half of the nineteenth century, was also influential in cooperative ideals taking hold in the region. From grass roots societies such as the Grange, the Farmer's Alliance Business Association organization emerged in 1891 and began actively marketing collective farming. In the Paso Robles area, a large Nordic influx during the 1870s and 1880s formed a third of the founders and stakeholders in the Farmers Alliance Business*

Association. The flourishing agricultural industry and ancillary businesses needed to support its growth gave the Farmers Alliance a strong foothold in Paso Robles.

In the 1890s the Southern Pacific Railroad had established a four-way monopoly controlling commercial transportation, grain milling, grain warehousing and the local lumber supply. This monopoly allowed the Southern Pacific to demand that towns and cities who wanted rail connections absorb the costs of construction by providing cash subsidies, granting access to rights-of-way, and donating the land for railroad depots. In Paso Robles, a man named Richard Shackelford controlled railroad enterprises.

In 1891 Alliance members from San Luis Obispo and Monterey counties gathered to lay the foundation for a new cooperative flourmill to compete with the monopoly of the Southern Pacific Milling Company. They voted to unite and go into the grain warehousing business, founding the Farmers Alliance Business Association (FABA), which was formally incorporated on June 20, 1891. They purchased land from Daniel Blackburn and developed a site that fronted the Southern Pacific tracks. Richard Shackelford declared that the sidetrack facing the warehouse could only be used by the Southern Pacific Milling Company and any movement across the property would be treated as trespassing. This claim was refuted by the newly formed California State Railroad Commission, and FABA was able to firmly establish a tradition of a supportive agricultural cooperation in California.

With this foundation, The Farmers' Alliance Business Association continued to influence economic agricultural practices in Paso Robles. Although the political Populists Movement born from the Farmer's Alliance died out in 1896, the Alliance cooperatives left behind an enduring legacy that influenced the local economy of the upper Salinas Valley long into the twentieth century. The endurance of FABA as a private company preserved the vital competition established by the Alliance against Southern Pacific Milling Company…

With the United States entrance into World War I in 1917, there was an enormous demand for agricultural products, which proved an economic boon to Central California. During the War, many farmers turned to the production of navy beans, since these were subsidized by the War Relief Administration. Before reliable refrigeration, beans could be shipped to the troops in Europe without spoiling, and San Louis Obispo County's economy boomed. The Hot Springs Hotel was the center of local fundraising efforts to support the War Effort.

When the war was over in 1918 these government subsidies ended, and area farmers turned again to dairy and produce. The steep decline in demand as European countries started to recover and produce their own supplies laid the groundwork for a depressed economy in the late teens and early 1920s. American farmers, who represented one-quarter of the economy, had expanded their output during World War I, when demand for farm goods was high and production in Europe was cut sharply. After the war, farmers found themselves competing in an oversupplied international market. Prices fell, and farmers were often unable to sell their products for a profit…

Advertisements placed in publications such as Sunset Magazine claimed that almonds would make the reader "independent for life," and trips aboard the Southern Pacific to attract out-of-town potential orchardists were arranged. From the mid teens through 1922, the Paso Robles Press dedicated a front page article of every issue to the Almond Growers Association. The Chamber of Commerce named its newsletter "The Nutcracker," with the

promotional text claiming Paso Robles as the "largest almond growing district in the world…"

Agriculture continued to play an important role in the expansion of Paso Robles during this period. In the 1940s, the local company of Jackson & Reinhart began to take over thousands of acres formerly managed by the Paso Robles Almond Growers Association. From 1950 to the late 1960s, Paso Robles produced 90 percent of the almonds sold in the nation. By the 1960s, however, California's water project brought large supplies of water to the San Joaquin and Sacramento Valleys. Land that previously lacked water to grow almonds was put into production. The area's main almond processing plant moved its operation to the San Joaquin Valley and the Paso Robles Almond Growers Association faded.

Viticulture in Paso Robles

The other major agricultural product that had a profound influence on the development of Paso Robles and the surrounding area were wine grapes. In 1858 a French Army "soldier of fortune" named Pierre Hippolyte Dallidet settled in San Luis Obispo. He built an adobe home on the grounds of the Mission San Luis Obispo and he purchased the failing vines of the Mission San Miguel Arcangel. He is credited with revitalizing the wine industry in San Luis Obispo County that had begun during the Mission era.

Many other local farmers followed Dallidet's example, including Indiana rancher Andrew York, who began planting vineyards on his 240-acre homestead in 1882. Within a few years, he found that the vines were yielding more than he could market, prompting him to establish Ascension Winery, known today as York Mountain Winery. The family planted some of the area's earliest Zinfandel vines, making Paso Robles famous for this variety. York initially sold his wines in San Luis Obispo and eventually as far away as San Francisco. Today, York Mountain Winery is the oldest winery in continuous operation in the county…

Under growing pressure from religious and political temperance movements, the 18th Amendment to the Constitution was enacted in 1920 prohibiting the sale, manufacture, and transport of alcohol in the United States; Prohibition lasted until 1933 when it was repealed by Franklin Delano Roosevelt. The California wine industry certainly suffered during this period, but at the same time, there was an influx of immigrants to the area who were willing to establish new vineyards.[1]

The most famous new vintner during this period was Ignace Paderewski, who purchased 2,000 acres of land for farming, and in the early 1920s planted Petite Sirah and Zinfandel on his Rancho San Ignacio vineyard. More than any other variety, Zinfandel had a strong influence on the early growth and development of the wine industry in Paso Robles. When Prohibition ended, Paderewski's wine was made at York Mountain Winery. The wines

[1] The California wine industry was aided by two loopholes in the Prohibition law: 1) sacramental wine was exempt with government permit and 2) sale of fresh and dried grapes were also exempt. The latter loophole was particularly complex because sellers and buyers could be charged with conspiracy if it was known that the grapes would be turned into wine. Additionally, vintners produced "wine bricks" made of concentrated grape juice for people to then dissolve. The bricks came with warnings stating that they were not meant for alcoholic consumption and if stored in a cool place for 21 days would result in wine (Burnham 2010; Blakemore 2015).

produced from grapes grown on Rancho San Ignacio went on to become award-winning and helped grow Paso Robles' reputation as a premier wine region…

…This era [post-World War II] saw a new generation of vineyard pioneers in the Paso Robles area, bringing university training and financial resources for large plantings. Dr. Stanley Hoffman, under the guidance of U.C. Davis and legendary enologist Andre Tchelistcheff, planted some of the region's first Cabernet Sauvignon, Pinot Noir and Chardonnay on his 1,200-acre ranch next to the old Paderewski Ranch in the hills of Adelaida, about five miles west of town. His Hoffman Mountain Ranch Winery (a portion now owned by Adelaida Cellars) was the first large-scale modern facility in the area.

New wine grape growers also began to cultivate the first large plantings on the east side of the Salinas River. Bob Young planted the area's first large scale commercial vineyard, now known as Rancho Dos Amigos on Shandon Heights. Herman Schwartz, managing partner for a group of investors, planted the 500-acre Rancho Tierra Rejada in 1973. From 1973 to 1977 Gary Eberle and Cliff Giacobine planted 700 acres, including the first modern commercial acreage of Syrah in the state and established Estrella River Winery, the largest winery in the area (purchased in 1988 by Nestle/Beringer).

Large vineyards and wineries continued to be established in Paso Robles through the 1980s and 1990s, as growers recognized that favorable soil and climate conditions, combined with reasonably priced and available land, allowed them to grow high-quality wine grapes at more competitive price levels than was possible in other areas.

3.2.4.3 ELECTRIC GENERATION AND TRANSMISSION IN PASO ROBLES

Presented below is an excerpted history of electric generation and transmission in California from *Guide to Evaluating Electric Transmission Structures for the National Register of Historic Places* (Adams 2010), followed by a discussion of this theme as it relates to San Luis Obispo County:

It was in 1879 when Thomas Alva Edison invented the incandescent light bulb, that electric transmission began its next great set of developments in modern history. Edison contributed to the development of new systems of power generation and distribution which initiated the development of the electric utility industry.

After Edison invented the light bulb, the 1880's saw a splurge of electric utility companies develop in California. Edison's Read Street Station began operating in 1882. Most of these electric utility companies used low-voltage direct current (D.C.) dynamos which could only transmit electricity about three miles. Since the transmission distance was not too great, only urban areas where populations were dense could economically be served by these early companies. The California Electric Light Company from San Francisco was the first to begin running long distance electric transmission lines in California starting in 1879. The California Electric Light Company had difficulty with their long distance lines because the D.C. system only allowed for short transmission. Nikola Tesla and William Stanley were the first to develop an alternating current (A.C.) for electric lighting. The A.C. system allowed higher voltages of electricity to be transmitted through the line than the D.C. system could handle. In 1890, four California cities; Santa Barbara, Visalia, Pasadena, and Highgrove, began to use this new technology in their power plants. Also introduced was the "converter," now called a transformer. The transformer reduced the high distribution voltage from the transmission line to a lower voltage to be used in houses with interior wiring.

The 1890's saw even greater advancements in electric transmission. The San Antonia Light and Power Company began using an oil-filled "step-up" transformer. The "step-up" transformer was created 1892 by Almarian William Decker and was used to convey 10,000 volts of A.C. current about fourteen miles from San Antonio Canyon to Pomona. Before Decker's invention, 1,000 volts was the largest voltage that lines could transmit. Shortly after this fourteen-mile line, a twenty-eight mile line was built by the same company and extended from San Antonio Canyon to San Bernardino. In 1899, the Edison Electric Company built the longest line to date, an eighty-three mile transmission line from the Santa Ana River to Los Angeles. They were able to achieve the extraordinary lengths by using glazed porcelain insulators which could handle up to 40,000 volts of electricity. The length of transmission lines only continued to expand into the 20th century. Bay Counties Power Company built a 142 mile long transmission line in 1901 which brought power from the Colgate Powerhouse in the Sierra Nevada to Oakland. They used cedar poles as the structure support which held copper and aluminum wires. This transmission line was even more impressive by the 4,427 foot expansion it made crossing the Carquinez Straits. The construction engineer responsible for the project was John Debo Galloway. Galloway is given credit for designing and constructing the cable span which was the longest in the world at the time. Galloway's transmission line was also the first electrical power produced in the Sierra Nevada and crossed the mountains into the Sacramento Valley. The power from this transmission line was then used by Bay Area residents. Galloway lived from 1869-1943 and is recognized as one of the major pioneers in the design of electric transmission facilities, lines, and towers in California.

The hydroelectric industry of the early 20th century was a major contributor to the development of electric transmission in California. Between 1900 and 1910 California's population increased by 60 per cent and with that expansion came the high demand for electricity. California's first hydroelectric plant was the Folsom Powerhouse on the American River in Sacramento County which began service in 1895. From this period until the end of World War II, hydroelectric systems evolved heavily in design and engineering. Hydroelectric companies in California provided a network of long distance electric transmission lines. The Bay Counties Power Company and the Standard Electric Company in 1902 had nearly complete electric coverage of the Bay Area and places like Stockton, Amador City, and Marysville.

The Edison Electric Company built a 118 mile long transmission line in 1907. This transmission line carried 75,000 volts to Los Angeles from the Kern River No. 1 hydroelectric plant. This transmission line system was the first line to use steel towers as the supporting structure. The towers were built by the Wind Engine Company which was a windmill manufacturer.

Some of the largest and most significant hydroelectric projects in California started in the late 1920s. The Big Creek Hydroelectric System is owned by the Southern California Edison Company. The Central Valley Project is owned by the federal government but was conceptualized by the State of California. The Big Creek Hydroelectric system, in 1929, generated a total of 424,500 kw operating across 36 miles of tunnels; a huge project in California during that time in hydro engineering. The project employed John Eastwood, a pioneer in dam engineering and design, for a number of years during the project. The Central Valley Project was one of the largest water conveyance projects ever undertaken. It was constructed as a reaction to the growing state of California's population including water and electricity needs. The CVP originally consisted of five central units; Shasta Dam, Delta-Mendota Canal, Friant Dam, Friant-Kern Canal, and the Contra Costa Canal. The

main operation of these units was to deliver Sacramento River Water from the north of California to the dry San Joaquin Valley. It now operates over 11 divisions/units across California. The Nevada Irrigation District (NID) began the Yuba-Bear river project in 1963, harnessing the Yuba and Bear rivers. PG&E partnered with NID on the Yuba-Bear river hydroelectric project which now provides enough electricity to power 60,000 homes. Today, Southern California Edison Company and PG&E own and operate a large share of hydroelectric systems in California. The Central Valley Project, owned by the Bureau of Reclamation, is still the largest multi-purpose hydroelectric project in California. PG&E currently owns and operates nearly 500 miles of hydroelectric systems throughout California with a generating capacity of 3,896 megawatts powering over 4 million homes. In recent decades electric companies throughout California, led by industry giants PG&E and Southern California Edison Company, continue to expand their electric transmission systems to reach further and provide greater energy than ever before.

3.2.4.4 ELECTRIC GENERATION AND TRANSMISSION IN SAN LUIS OBISPO COUNTY

The history of electric power in San Luis Obispo County coincides closely with the early days of the new power source. Constructed in 1883, the first electric plant in San Luis Obispo arrived just 4 years after California's electric history began with the establishment of the California Electric Light Company in San Francisco in 1879 (Pacific Gas and Electric Company 1954). The San Luis Obispo plant was developed by the San Luis Obispo Gas and Electric Company and consisted of a small, steam engine-powered dynamo that was primarily used to light carbon-arc street lights. Other plants soon followed, including the Santa Maria Electric and Gas Company in Santa Maria, the Russell Robinson Electric Company in Arroyo Grande, and the Paso Robles Light and Water Company in Paso Robles.

The "modern" electrical history of the Central Coast region began in 1913 when Emory and Albert Graves Wishon organized the Midland Counties Public Service Corporation. The new enterprise soon purchased many of the existing small electric systems in the area, including the operation in Paso Robles. Other acquisitions in the following years expanded the company's service into Fresno, Monterey, and Santa Barbara Counties (Walker 1919:168). Although the company initially relied on the generation capabilities of the small systems it acquired, increased demand soon led the company to purchase electrical energy from the San Joaquin Light and Power Corporation. By 1917, electricity was being conveyed to the Central Coast over a 137-mile, 60,0000-volt transmission line that ran from the San Joaquin Light and Power Corporation's Henrietta Substation in Kings County, through Coalinga, San Miguel, Paso Robles, and San Luis Obispo to Santa Maria in Santa Barbara County (Railroad Commission of the State of California 1917:322).

As electricity became commonplace in homes across California in the 1920s, the need for additional systems grew with it. In order to provide the Midland Counties Public Service Corporation with more energy, the San Joaquin Light and Power Corporation developed additional transmission lines and substations. This included the development of new lines extending to smaller communities such as Guadalupe, as well as the expansion of substations in McKittrick and Santa Maria (*Electrical West* 1922:417). Other expansions in San Luis Obispo County during this period included new lines to Morro Bay, Cayucos, and Cambria, and eventually Shandon, Cholame, and Parkfield.

Many of the early steam plants were retired by the 1920s and in the following decades, the Central Coast region increasingly received its energy from generation plants to the east operated by the San Joaquin Light and Power Corporation. Local energy production eventually returned to the region with the development of the 300,000-kilowatt Morro Bay steam plant in the 1950s, by which time the Midland Counties Public Service Corporation was acquired by Pacific Gas and Electric (Pacific Gas and Electric Company 1954;

Williams 1997:292). This new plant resulted in the construction of new high voltage power lines that delivered electricity to the local communities, and, with the subsequent development of the Gates substation in Fresno County, reversed the historic trend by transmitting power back to the San Joaquin Valley.

4 NATIVE AMERICAN COORDINATION

As part of the effort to identify indigenous cultural resources within the study area, two requests were made of NAHC to search the Sacred Lands Files. The first request was made on March 29, 2016, and the second on April 5, 2016. On June 27, 2016, letters were sent to two contacts NAHC identified as possibly having knowledge of cultural resources within the study area. The letters requested any available information on resources in the project vicinity and invited general commentary or questions pertaining to the project. Two informal tribal outreach meetings were held on August 23, 2016. Each of the two tribes identified by NAHC (the Salinan Tribe of Monterey and San Luis Obispo Counties and the Xolon-Salinan Tribe) requested a separate meeting with representatives from the project proponents.

Patti Dunton of the Salinan Tribe of Monterey and San Luis Obispo Counties expressed concerns over the general sensitivity of the Santa Ysabel Ranch area, which is outside of the study area. She also stated that the tribe would further review the information that they had been provided.

The Xolon-Salinan Tribe indicated that their ancestors had used Dry Creek as a transportation corridor. They also indicated that the areas surrounding the Estrella and Salinas Rivers were sensitive for cultural resources. Details regarding Native American outreach are included in Table 1 and in Appendix A.

Table 1. Native American Coordination Summary

Native American Contact	Letter Sent	Follow-Ups
Salinan Tribe of Monterey, San Luis Obispo Counties Patti Dunton, Tribal Administrator 7070 Morro Road, Suite A Atascadero, CA 93422 Salinan/Chumash salinantribe@aol.com (805) 464-2650 (805) 235-2730 cell	06/27/2016: via U.S. Mail and email	The proponents met with Patti Dunton on 8/23/2016 to discuss the project.
Xolon-Salinan Tribe Karen White, Council Chairperson PO Box 7045 Spreckels, CA 93962 Salinan blukat41 @yahoo.com 831-238-1488	06/27/2016: via U.S. Mail and email	The proponents had a teleconference with Xolon-Salinan Tribe representatives (Karen White, Council Chair, and Donna Haro, Tribal Headwoman) and their Cultural Resources Consultant (Karen Fontanetta) on 8/23/2016.

5 METHODOLOGY

5.1 Records Search

Mr. Armstrong requested a search of the California Historical Resources Information System (CHRIS) from the Central Coast Information Center (CCIC), located at U.C. Santa Barbara. The CCIC provided the results to Mr. Armstrong on April 12, 2016. The search included any previously recorded cultural resources and investigations within 0.5 mile of the study area. The CHRIS search also included a review of the NRHP, the CRHR, the California Points of Historical Interest list, the California State Historical Landmarks list, the Archaeological Determinations of Eligibility list, the Historic Properties Directory, the Archaeological Determinations of Eligibility List, the California Inventory of Historic Resources, the California Department of Transportation Bridge Survey, and local historic resources inventories.

5.2 Additional Background Research

To supplement the CHRIS records search, researchers conducted a desktop analysis of online and documentary sources in an effort to determine past land uses and assess the potential for buried prehistoric and historical deposits. This included the examination of historical maps available online. Researchers consulted historical USGS topographic maps (1919, 1952, 1966), General Land Office survey plats (1869), historical aerial photography (NETR Online 2016; Google 2016), Sanborn Fire Insurance Company maps, the *City of Paso Robles Historic Resources Survey* (Historic Resources Group 2010), and the *Paso Robles Historic Resources Inventory* (Historic Resources Group 2014). U.C. Berkeley's Earth Sciences and Maps Library was visited for access to its Historic Topographic Maps of California database. The David Rumsey Historical Map Collection and the California Historical Topographical Maps Collection from the California State University Chico Library were accessed for historical map and geospatial data as well. U.C. Davis' California Soil Resource Laboratory Online Soil Survey was reviewed for information on landforms and depositional history in the study area. Numerous ethnographic sources were consulted for information on indigenous populations during the Contact Period. Searches were conducted for California historical resources and landmarks on the California Office of Historic Preservation website and for resources listed on the NRHP using the National Park Service's focused digital asset search. Historical aerial photos from the Nationwide Environmental Title Research database and the U.C. Berkeley California Aerial Photography database were also consulted.

5.3 Buried Site Sensitivity Study

In order to assess the potential of the study area to contain subsurface cultural deposits, a geoarchaeologist conducted a geoarchaeological desktop analysis by consulting a combination of aerial imagery, Natural Resources Conservation Service soils data (SoilWeb 2016), and geologic maps and reports available for the area (Dibblee and Minch 2004; Durham 1974). Buried site sensitivity was assessed largely on the basis of landform type, depositional regime, and age of geologic surfaces as inferred from the above sources. No field-based geoarchaeological testing was conducted for this study.

5.4 Archaeological Survey

Archaeologists conducted an intensive pedestrian survey of the study area from May 16–19, 2016, and a supplemental survey on November 15, 2016. The ASA generally addressed a 400-foot-wide corridor for the new 70 kV power line segment and a 100-foot-wide corridor for the reconductoring segment. The study area consists of approximately 474 acres. It is assumed that all staging and project ground-disturbing activities will occur within the area surveyed for archaeological resources. It should be noted herein that the ASA covers all areas of potential ground disturbance. The pedestrian survey involved systematic surface inspection utilizing pedestrian transects spaced at 15-meter (m; approximately 50-foot) intervals.

Archaeologists examined the ground surface for the presence of prehistoric artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools), historical artifacts (e.g., metal, glass, ceramics), sediment discoloration that might indicate the presence of a cultural midden, roads and trails, and depressions and other features that might indicate the former presence of structures or buildings (e.g., post holes, foundations).

When cultural resources were encountered, archaeologists collected all data necessary to complete the appropriate California Department of Parks and Recreation (DPR) 523 series forms. Resources were mapped with handheld mapping-grade Trimble Geo7X and GeoXT Global Positioning System (GPS) units with sub-meter accuracy and differential correction. Field GPS data for sites were post-processed using Trimble Pathfinder Office software and projected into Universal Transverse Mercator, Zone 10 North, North American Datum 1983 coordinates. All GPS data were exported into Geographic Information Systems (GIS) geodatabases and plotted onto the associated geo-referenced USGS 7.5-minute quadrangle to ensure accuracy and to produce location maps of all resources. In addition to mapping, archaeologists documented all resources with overview photographs. No artifacts were collected during the surveys.

5.5 Built Environment Survey

The built environment study consisted of a field survey and research into the history of the properties within the study area. Researchers consulted County Assessor records, historical maps, and historical aerial photography. An architectural historian photodocumented potential historic-era architectural resources within the study area from May 16–20, 2016. Due to access restrictions, the architectural historian was not able to survey all potential historical architectural resources within the BESA. Where access was not possible, researchers relied on the results of the desktop review to determine properties' ages and photodocumented the potential historic-era architectural resources from the public easement.

6 RESULTS

6.1 Records Search

The CCIC conducted an initial records search on April 12, 2016, at the request of Mr. Armstrong of PG&E. Records search materials from the CCIC are provided in Appendices B and C. The results of the records search are detailed below.

6.1.1 Previously Conducted Cultural Resource Studies

Results of the CHRIS records search indicated that 71 previous cultural resource studies have been conducted within a 0.5-mile radius of the study area. Of these studies, 21 overlap with the current study area. Details pertaining to these investigations are presented in Table 2.

Table 2. Previous Cultural Resources Studies within 0.5 Mile of the Study Area

Report Number	Author	Year	Study Title	Proximity to Study Area

6.1.2 Previously Recorded Cultural Resources

The CHRIS records search also identified 37 previously recorded cultural resources within a 0.5-mile radius of the project. Of these 37 resources, two (P-40-038110 and P-40-038111) are plotted by the CCIC as being within the study area. P-40-38110 is a historical isolate consisting of three ceramic fragments. P-40-38111 is a prehistoric isolate consisting of a single biface fragment. Details pertaining to these cultural resources are presented in Table 3.

* SHL = State Historic-era Landmark.

6.2 Buried Site Sensitivity Study

The study area crosses alluvial flats of the southern Salinas Valley, which is dissected by multiple drainages including Huerhuero Creek, a northwesterly flowing meandering stream. The reconductoring portion of the study area is situated primarily on the eastern terrace of the Salinas River.

Approximately half of the study area is underlain by weakly indurated Pliocene and Pleistocene valley fill belonging to the Paso Robles formation (Qtp), an extensive stratigraphic unit that originally covered most of the southern Salinas Valley area (Dibblee and Minch 2004; Durham 1974:54). The formation, which accumulated as a result of fluvial and lacustrine deposition following the recession of a large Tertiary sea, is composed mainly of sandstone and conglomerate, with some mudstone, shale, and limestone also present (Durham 1974: 54-58). The Paso Robles formation is exposed in the eastern portion of the study area, in a large patch southwest of Huerhuero Creek, and in small areas east of the Salinas River. The unit is also exposed along much of the existing 70 kV power line segment (Dibblee and Minch 2004).

The remainder of the study area is veneered in surficial alluvium dating to the late Pleistocene (Qoa) and Holocene (Qa/Qg). Quaternary valley and stream channel alluvium, composed of Holocene-aged sand and gravel deposits, occurs within the project alignment in the vicinity of Huerhuero Creek and Salinas River. Older terrace surfaces, which occur within the transmission line alignment immediately east of Huerhuero Creek and extending south from the creek's confluence with Salinas River, and within the northern portion of the reconductoring segment, contain gravel and sand deposits dating to the Late Pleistocene (Dibblee and Minch 2004).

Soils in the study area vary based on landform association; hillslopes of the Paso Robles formation are dominated by alfisols of the Arbuckle-Positas complex, Nacimiento-Los Osos complex, Sesame sandy

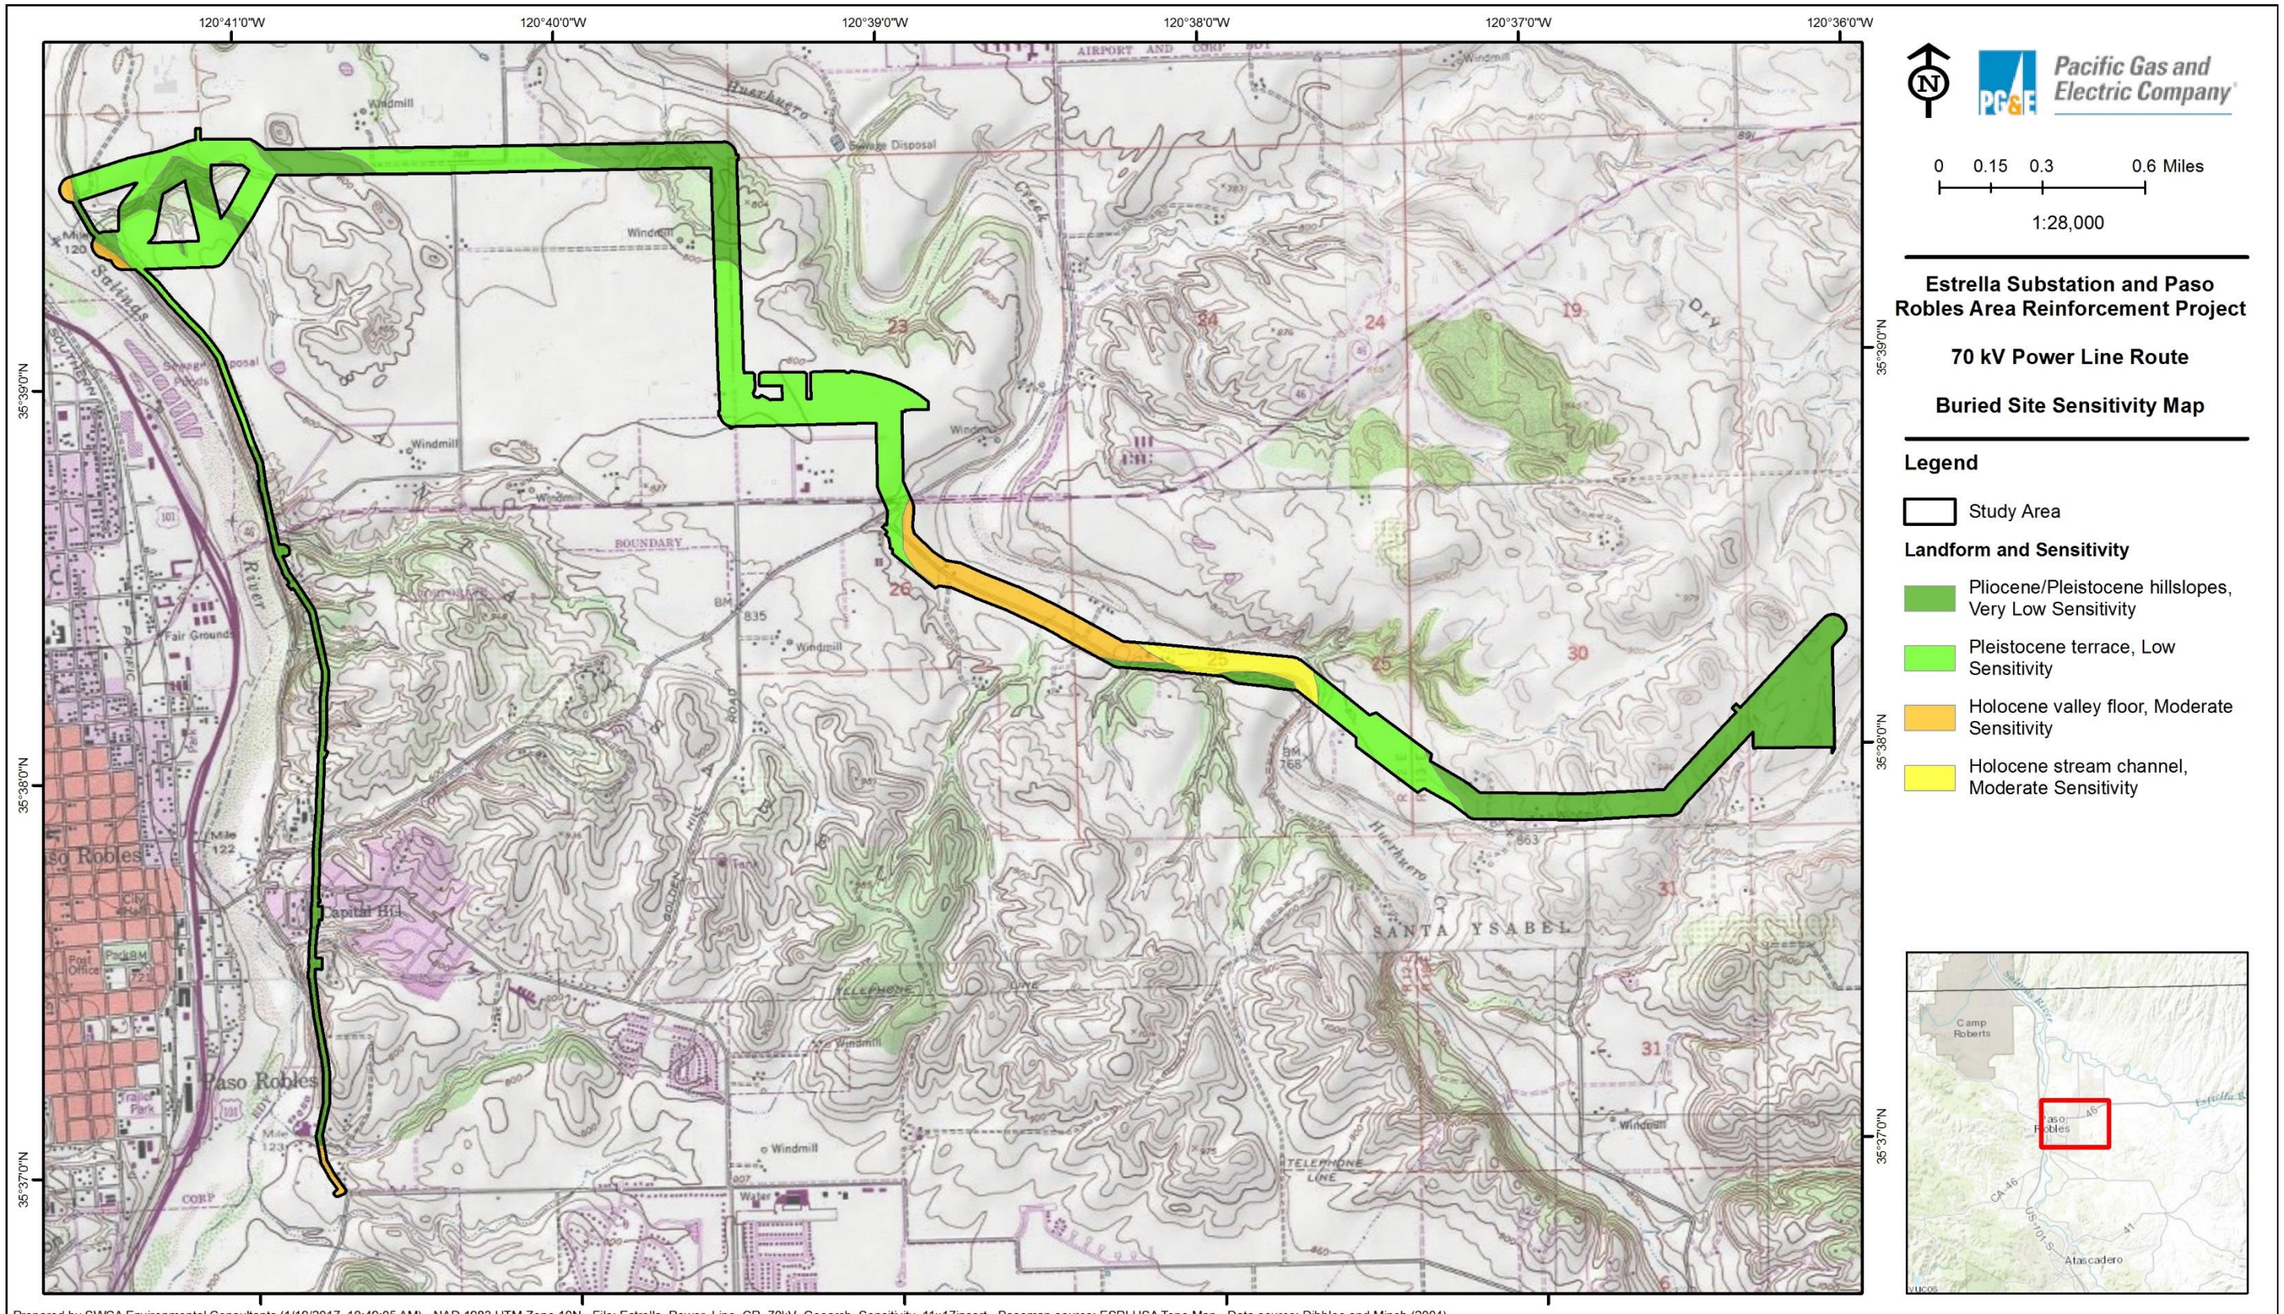
loam, Linne-Calodo complex, and Balcom-Calleguas complex. Late Pleistocene terraces contain alfisols belonging to the Hanford and Greenfield gravelly sandy loams and Arbuckle-Positas complex, while Holocene-aged valley floors and stream channels are dominated by entisols of the Arbuckle-San Ysidro complex, Arbuckle fine sandy loam, San Ysidro loam, and Nacimiento-Ayar complex.

Geomorphology in the study area can be classified into three distinct groups on the basis of landform-sediment assemblages: 1) Pleistocene/Pliocene-aged hillslopes composed of residual silty clay, sandy loam, clay loam, and loam sediments underlain by weathered shale and sandstone bedrock; 2) Late Pleistocene terraces composed of loam and fine sandy loam alluvium; and 3) Holocene-aged valley floors and stream channels composed of gravelly sandy loam and fine sandy loam alluvium (Dibblee and Minch 2004; SoilWeb 2016).

Based on soils data and geologic maps of the southern Salinas Valley, land surfaces within the study area range in terms of both age and depositional environment, and therefore have varying potential to contain buried sites. Pliocene/Pleistocene-aged landforms belonging to the Paso Robles formation pre-date human occupation in the region and therefore have very low potential to contain deeply buried, intact, subsurface cultural materials. In addition, land surfaces associated with the Paso Robles formation are typically hillslopes containing shallow residual deposits derived from weathered bedrock, with little to no sedimentary accumulation resulting from alluvial or aeolian processes. Depending on hillslope positioning, sites associated with the Paso Robles formation may also be subject to erosional disturbances.

Pleistocene-aged alluvial terraces in the study area likewise have low potential to contain buried archaeological sites. Pleistocene terrace surfaces pre-date the majority of human occupation in the region, and are relatively stable depositional environments not undergoing high rates of erosion or deposition. As a result of their age and lack of significant Holocene-aged deposits, these landforms are unlikely to yield sites with large subsurface components. There is some potential for shallow burial of artifacts within thinly veneered sheetwash deposits that have accumulated on low-lying terrace surfaces over the course of the Holocene; however, if present, these deposits are expected to be shallow and discontinuous. Artifacts in these settings may also become shallowly buried as a result of post-depositional factors such as agricultural tilling and bioturbation.

Holocene-aged valley floor and stream channels in the study area have moderate potential to contain buried archaeological sites due to the fact that these landforms date to or post-date the period of human occupation in the region, and due to the active nature of sedimentary deposition in these settings. Although the bed of Huerhuero Creek is unlikely to contain buried materials due to high rates of depositional and erosional energy within the active creek bed, there is potential for preservation of buried cultural deposits within the channel banks and adjacent floodplain. Any areas determined through in-field analysis to contain evidence of overbank flood deposits would have high potential to yield intact, deeply-buried prehistoric components. Fine-grained flood deposits are highly sensitive indicators for buried sites for two reasons: 1) the rapid nature of sedimentary deposition, which is ideal for capping and preserving archaeological materials; and 2) the relatively low rate of depositional energy, which prevents the erosion and displacement of artifacts and features. Additional testing would be required to verify the presence or absence of overbank flood deposits within the study area.



In summary, most of the study area has very low to low potential to contain buried archaeological sites. Areas containing Holocene-aged valley floor and stream channel alluvium, confined to the vicinity of Huerhuero Creek and Salinas River, have moderate sensitivity for buried archaeological resources (Figure 3).

6.3 Archaeological Survey

Archaeologists conducted a pedestrian archaeological survey of all accessible portions of the study area from May 16–19, 2016. A supplemental survey was conducted on November 15, 2016. A total of three archaeological sites and seven isolated artifacts were identified in the course of the fieldwork (Table 4; Appendices D and E). Of the archaeological sites, one is prehistoric and two are historic. The seven isolated finds are prehistoric, all lithic tools and debitage. Previously recorded isolates P-40-38110 and P-40-038111 were not relocated during the survey effort. Terrain within the study area consists primarily of gently rolling terrain with slopes varying from 0–5 percent, though sheer bluffs on the eastern terrace of Salinas River on the western edge of the study area are occasionally present. Vegetation cover consisted of planted vineyards, low annual grasses, oak woodland, and riparian zones.

Given that the project extends several linear miles, is comprised of multiple parcels with different owners, and is within areas of various levels of development, ground surface visibility during the survey was highly variable but generally moderate to poor, ranging from less than 5 percent in undisturbed, highly vegetated areas to over 90 percent in unpaved roadways and disturbed areas that have been cleared of vegetation. Planted vineyard lands had an average ground surface visibility of 40–50 percent due to the presence of vines and non-native grasses and forbs. Developed areas and those obscured by hardscape features had negligible surface visibility at the time of survey and were not surveyed. A small number of parcels were not surveyed, as landowners either denied access to crews or did not provide access permission. In addition, certain parcels were not surveyed do to unsafe conditions as a result of livestock or domestic animals (Appendix F). Of the entire 474-acre study area, 407 acres were subject to pedestrian survey, 18 acres were not surveyed due to aforementioned issues of access or safety, and 49 acres are developed and were not surveyed.

Figure 3. Buried Sites Sensitivity Map

36052-ISO-003	Prehistoric isolate	Prehistoric	Monterey chert core
36052-ISO-004	Prehistoric isolate	Prehistoric	Franciscan chert biface
36052-ISO-005	Prehistoric isolate	Prehistoric	Monterey chert contracting stem projectile point
36052-ISO-006	Prehistoric isolate	Prehistoric	Monterey chert primary flake
36052-ISO-007	Prehistoric isolate	Prehistoric	Monterey chert multidirectional core
36052-ISO-008	Prehistoric isolate	Prehistoric	Monterey chert interior flake

6.3.1 Archaeological Sites and Isolates

6.3.1.1 36052-S-001 – HISTORICAL WELL AND UTILITY POLE

The site consists of a historic well feature and utility pole with remnant glass insulators. The well feature is made up of two original steel pipes, one with a 12.75-inch diameter and the other with a 6-inch diameter (Figure 4). The larger steel pipe was later modified with a 1.5-inch polyvinyl chloride tie-in and copper wiring with a *terminus post quem* (date after which) of 1970. The steel pipe elements are encased within a concrete slab collar that measures 40 by 34.5 inches wide and 1 foot thick. The historical cedar utility pole measures approximately 25 feet high and is located 9 feet southwest of the well. It is tied into a modern utility pole with a new transformer along Union Road.

The historical pole includes metal hardware such as nuts, bolts, and brackets; one steel cable serving as a support anchor; a single wooden cross-beam with three glass insulators; a ferrous sheet-metal fuse box; and wiring. The interior box of the utility pole has braided cables that connect to the fuse block. There are two colorless glass insulators and one aqua insulator. The colorless insulators bear wide-script embossed maker's marks reading "HEMINGRAY-20," feature round drip points, and are of a type produced by the Hemingray Glass Company between 1941 and the 1960s (Willis 2016). The pole appears to have been last inspected in 2008. Both features appear to date to the first half of the 20th century and have been highly disturbed by modern construction and general land-use.

Figure 4. Overview of site area showing well feature in foreground in relation to the utility pole 9 feet southwest, viewed southwest.

6.3.1.2 36052-S-002 – HISTORICAL DUMP SITE

The site is a trash dump consisting of a mixed redeposit of historical and modern refuse and disused farm equipment (Figure 5). It measures 50 feet from east to west, by 20 feet from north to south. Refuse is largely confined to a push pile measuring 35 feet by 20 feet by 10 feet high, which appears to have been created with the original grading or later regrading of the roadway. It may also be the product of multiple grading episodes, as the mixed nature of its artifacts suggests. Modern refuse appears to be confined to the top and roadway-facing portions of the pile, suggesting incidental disposal of refuse at the site during later periods. The original date of deposition and primary context of the dump is unknown.

The pile contains historical refuse including stove elements and car parts dating to the 1930s, along with plastic fragments dating to the 1980s, bottle glass shards, galvanized sheet metal, vehicle taillight lens fragments and other car parts, burnt wood, steel chicken wire, converse sneakers, steel bedframe elements, clothing, tires, and structural rubble. In sum, the refuse pile contains a mix of more than 100 individual artifacts with dates spanning at least a 60-year period.

Figure 5. Overview of refuse dump showing pile of mixed debris and farm equipment, view facing southwest.

Farm equipment within the site is well-worn and highly corroded surplus machinery that has been discarded along the south side of the unnamed farm road. A total of five farming machines were identified, with dates ranging from the 1930s to the early 1960s. These include a manure spreader with pneumatic tires likely dating to the 1950s (Figure 6); a hay rake from the 1960s; a modified spring harrow from the 1950s with steel wheels replaced by pneumatic tires, spokes welded to the rim, and a metal plate with a maker's mark reading "JUMBO CONSTRUCTION AND FARM MACHINERY/ SERIAL NO. 4772…/SIMPSON STEEL CO[MPANY]/ LOS ANGELES – CALIFORNIA;" and two ripper furrows dating to the 1950s, one with a single tire, and one with three.

Figure 6. Detail of the disused ca. 1950s manure spreader with pneumatic tires.

6.3.1.3 36052-S-003 – PREHISTORIC LITHIC SCATTER AND SHELL SCATTER

Prehistoric archaeological site S-36052-003 is a low-density lithic and shell scatter consisting of approximately 30 Monterey chert flakes and three marine shell fragments (black turban snail [*Tegula funebralis*] and Pismo clam [*Tivela stultorum*]). Cultural material was distributed across a horizontal space of approximately 165 meters (north/south) by 45 meters (east/west) (Figures 7 and 8). Profiles exposed in cliff-face on the south and western sides of the site did not show any indication of subsurface deposits or features, though rodent burrows further inland did reveal some flakes. The horizontal distribution of lithic debitage indicates some clustering near the residence and closest to the unnamed drainage on the northeast end of the site, as well as a lighter density concentration in the area of row crops on the southeast end.

Lithic constituents represent multiple stages of tool production, with primary reduction flakes predominating (Andrefsky 2006). Debitage includes white, cream, red, and dark brown colored chert fragments (Figures 9 and 10). No formed tools or formal artifacts were identified within the site. Historical agricultural disturbances such as plowing and some residential development including roadway grading have impacted the site to some degree. Considerable erosion damage is also apparent along the western edge of the site, particularly where the unnamed drainage meets the edge of the terrace, as evidenced by the concrete riprap that has been placed at the location (Figure 11).

Figure 7. Overview of site area on a terrace overlooking Salinas River, viewed north.

Figure 10. Additional Monterey chert debitage identified at the site, vertical orientation.

Figure 11. Concrete riprap placed to stem further erosion along the southwestern edge of the site.

6.3.2 Isolated Finds

6.3.2.1 36052-ISO-002 – MONTEREY CHERT BIFACE

The isolate is the proximal end of a fractured, late stage biface blank (Figure 12). It is made of dark brown Monterey chert and measures 30 millimeters (mm) (length [L]) × 25 mm (width [W]) × 10 mm (thickness [Th]). The fracturing of its distal end may have occurred during tool production. It may also have occurred naturally or as a result of historical activities. The isolate was located on an active residential driveway adjacent to a drainage on the slope of a terrace, and may have been introduced to the area along with roadway gravels.

Figure 12. Proximal end of an isolated and fractured Monterey chert biface blank, vertical orientation.

6.3.2.2 36052-ISO-003 – MONTEREY CHERT CORE

The isolate is a greenish-gray chert core fragment measuring 50 mm (L) × 30 mm (W) × 15 mm (Th) (Figure 13). The core exhibits evidence of primary and secondary flake removal with possible pressure flaking on the ventral surface. The isolate was located on the surface within an existing vineyard.

Figure 13. Isolated greenish-gray chert core exhibiting primary and secondary flake removal, vertical orientation.

6.3.2.3 36052-ISO-004 – MONTEREY CHERT BIFACE

The isolate is a greenish-gray Franciscan chert biface fragment measuring 38 mm (L) × 15 mm (W) × 8 mm (Th) (Figure 14). The isolate was located on the surface of a riverside terrace.

Figure 14. Dorsal side of an isolated Franciscan chert biface fragment, vertical orientation.

6.3.2.4 36052-ISO-005 – MONTEREY CHERT CONTRACTING STEM POINT

The isolate is a gray Monterey chert contracting stem projectile point measuring 44 mm (L) × 26 mm (W) × 12 mm (Th) (Figure 15). Its stem narrows down to 10 mm in width. The point appears to have been retouched. While the point could not be definitively associated with a particular series, the material type and shape are consistent with the Vandenberg Contracting Stem series, which typically dates to the Late Archaic period but persists into the Intermediate period (2500 B.C.–A.D. 500) (Justice 2002). The isolate was located in a disturbed context within an active vineyard.

Figure 15. Close-up view of projectile point.

6.3.2.5 36052-ISO-006 – MONTEREY CHERT PRIMARY FLAKE

The isolate is a single milky gray chert primary reduction flake. It was identified in a disturbed context within an active agricultural field (Figure 16). It measures 50 mm (L) x 35 mm (W) by 7 mm (Th).

Figure 16. Isolated gray chert primary flake, vertical orientation.

6.3.2.6 36052-ISO-007 – MONTEREY CHERT MULTIDIRECTIONAL CORE

The isolate is a tan and white chert multidirectional core exhibiting numerous flake removal scars (Figure 17). The core was located in a disturbed context within an active horse and cattle corral. It measures 45 mm (L) x 40 mm (W) by 28 mm (Th).

Figure 17. Isolated multidirectional chert core, vertical orientation.

6.3.2.7 36052-ISO-008 – MONTEREY CHERT INTERIOR FLAKE

The isolate is a single tan and white Monterey chert interior flake (Figure 18). The flake was located in a disturbed context within an active vineyard. It measures 54 mm (L) x 40 mm (W) by 18 mm (Th).

Figure 18. Isolated Monterey chert interior flake.

6.4 Historical Built Environment Resources

Architectural historians conducted a built environment survey of the study area and identified six historical built environment resources that included buildings, structures, or objects constructed over 45 years ago (Table 5; Appendices G and H), each of which is described in greater detail in the section below. The six resources were recorded on DPR 523 Series forms and evaluated for federal, state, and local eligibility. The complete set of DPR forms prepared for all six resources can be found in Appendix E of this report.

Table 5. Resources Recorded in the Study Area

Trinomial or Temporary Designation	Resource Type	Built Date	Description
Johnson House (2965 Union Road)	Historic-era residential property	Ca. 1890	Late-19th century masonry residential building
3310 Union Road	Historic-era residential and agricultural property	1940	Property containing various residential and agricultural buildings
3510 Union Road	Historic-era residential property	1948	Property containing two single-family residences and various outbuildings
3570 Union Road	Historic-era residential and agricultural property	Ca. 1962	Property containing three residences and various outbuildings
4374 Union Road	Historic-era agricultural property	1920	Property containing various residential and agricultural buildings
Existing 70 kV Power Line	Historic-era transmission line	Ca. 1954	Wood-pole transmission line

6.4.1 Johnson House (2965 Union Road)

The Johnson House is a two-story masonry residence that is situated on a flat lot just north of Union Road (Figure 19). Square in plan, it sits on a concrete foundation and is capped by a corrugated metal hipped roof with a centrally located brick chimney. The exterior cladding features a running bond pattern that is punctuated by long arched window openings along the ground level with smaller rectangular windows above, underneath the roof eave. Nearly all of the windows appear to have been replaced with varying wood-framed types, with many of the windows on the larger arched openings located with infill pieces of plywood. Three concrete steps lead to the primary entry, centrally located on the north elevation. A secondary entrance is located on the west elevation towards the northern corner, where remnants of a former porch are also visible. Immediately to the north of the brick building is a wood barn with a square tower that features two shed roof extensions to the north and west. A second single-story, single-family residence is located on the same parcel to the northwest of the subject building; however, because it was constructed in 1977, it was not recorded or evaluated as part of the current survey.

Figure 19. Overview of Johnson House, viewed northeast.

6.4.2 3310 Union Road

3310 Union Road is a residential property located in unincorporated San Luis Obispo, east of Paso Robles (Figure 20). Bound by the dry bed of Huerhuero Creek to the north and Union Road to the south, the irregularly shaped parcel contains two residential buildings and a number of agriculture-related outbuildings. The majority of the buildings are clustered in a small complex towards the western end of the parcel, while one of the residential buildings is located to the east.

Figure 20. Overview of 3310 Union Road, viewed northwest.

Constructed in 1940, the primary residence is a single-story Ranch-style house that is L-shaped in plan. It is a wood-framed building sheathed in stucco and capped by a gable-on-hipped roof, that extends out on the primary (south) elevation to create a covered porch that runs the length of the building. It features double-hung, wood-framed windows and wood-paneled doors that are covered by metal screens. Immediately west of the residence is a small rectangular outbuilding that appears to have been constructed ca. 1940. Capped by a corrugated metal sheathed shed roof, the wood framed building is clad in horizontal wood siding, which is punctuated by window and door openings, many of which are boarded over with plywood; other windows are original multi-light wood-framed windows. Also constructed ca. 1940, is a rectangular wood barn east of the primary residence that features an end gable corrugated metal roof, which extends to the north and south. Large sliding metal doors on the west elevation have been partially covered with plywood.

Further to the west of the primary residence are additional agricultural outbuildings. At the far western edge of the property, just north of Union Road, is a large rectangular standing seam metal workshop with a very gently sloped end gable standing seam metal roof that was constructed between 1967 and 1976. A large metal roll-up garage door is centered on the southern elevation with two single-hung vinyl windows to the east. On the east elevation there is a series of three sliding windows with five rectangular sliding vinyl windows just below the eaveline. A large metal roll-up door is centered on the west elevation with a single, solid personnel door to the south. Immediately to the north, is another corrugated metal outbuilding that is

rectangular in plan that was constructed between 1994 and 2005. The building appears to have windows on the south and east elevations and a deep overhang on the west elevation. Scattered around the building complex are water tanks, portable metal canopies, conex storage boxes, and farm equipment.

Further to the east of the residential complex is a secondary residence that was constructed in 1998 with a listed address of 3450 Union Road. Rectangular in plan, the one-story building is sheathed in rough-textured stucco and capped by a side-gabled, asphalt shingle roof. A double-wide, aluminum roll-up garage door is located at the western end of the primary (south) elevation, with the primary entrance situated slightly to the east. Windows are vinyl-sliders and located sporadically located across the building.

6.4.3 3510 Union Road

3510 Union Road is a residential property on a flat rectangular parcel fronting Union Road to the south and bordered by the dry riverbed of Huerhuero Creek to the north. It contains two detached, single-family residences: 3510 Union Road to the west and 3530 Union Road to the east (Figure 21). Constructed in 1948, 3510 Union Road is a Ranch-style residence that is rectangular in plan. The building is constructed of concrete masonry units and capped by a side-gable, asphalt-shingle roof with a central gable dormer. The main entry is slightly off center to the east and a large garage door is located on the western end of the elevation. The house has aluminum sliding windows and there are metal awnings located above the windows on the east elevation. Located to the east is 3530 Union Road, a one-story, single-family residence that was constructed in 1964. Square in plan, the building is clad in vertical wood boards and is capped by a hipped roof sheathed in asphalt shingles. The main entry is located in the western corner of the south elevation. Two aluminum sliding windows, one large and one small, are located to the east of the entry. A single door with glass panes and two sliding aluminum windows are present on the east elevation. The property is enclosed by a wood fence and there are a number of small ancillary buildings to the north, including a detached garage and several small storage buildings.

Figure 21. Overview of 3510 Union Road, viewed north.

6.4.4 3570 Union Road

3570 Union Road is a residential property located on an L-shaped parcel situated between Union Road to the south and Huerhuero Creek to the north. It contains a primary residence and multiple outbuildings located at the rear (north) of the property. Records on file with the County Assessor indicate the primary residence was constructed in 1962. It is located at the southwest corner of the parcel and is a one-story rectangular building with a side gable roof and is clad in wood siding of various sizes (Figure 22). The building has a large fixed window and two smaller sliding windows on the south elevation and two smaller sliding windows and one long three-bay rectangular window on the north elevation. The east and west elevations each have a single personal door, and there is a concrete patio to the east and north, which is enclosed by a chain-link fence.

Figure 22. Overview of primary residence at 3570 Union Road, viewed northwest.

To the northeast of the primary residence are two other small residences, a detached garage, and other small outbuildings. Construction dates for these buildings are currently being confirmed through supplemental archival research. The northwestern-most residence is a one-story rectangular building sheathed in asbestos siding and capped by a side-gabled roof (Figure 23). It features original wood doors and double-hung wood windows, which sporadically punctuate the exterior elevations. An addition with a shed roof has been constructed on the east elevation. Adjacent to the east of this residence is a detached one-story square garage with a hipped roof. Constructed of masonry, it features a large double-swing door on the south elevation and a single wood door on the west elevation. West of the garage is a third one-story square residence with a side-gabled roof and vertical wood siding (Figure 24). The south elevation features two square windows flanking the main entry. Additional scattered features and debris are spread across the property, including a windmill, portable storage units, propane containers, and various in-ground poles and ranching equipment.

Figure 23. Overview of secondary residence and detached garage at 3570 Union Road, viewed north.

Figure 24. Overview of secondary residence at 3570 Union Road, viewed north.

6.4.5 4374 Union Road

4374 Union Road is an agricultural and residential property that occupies an L-shaped parcel fronting Union Road (Figure 25). Currently functioning as a vineyard, the property features two, detached, single-family residences and various agricultural-related outbuildings and structures. The residential building located towards the southern end of the property was constructed in 1920, according to records on file with the County Assessor. L-shaped in plan, the house has a side-end gabled roof and a chimney in the southern corner of the east elevation. The windows appear to have been replaced since the residence was originally constructed. Located to the northwest is a second single-family residence that was constructed in 1989. Two stories in height, the building features a multi-level roof and an attached one-story garage. Between the two residences are a number of agricultural buildings, such as barns and other support structures. Because access to the privately-owned property was not authorized at the time of the field survey, observations were made from the public right-of-way and through examination of historical and current aerial photographs.

Figure 25. Overview of 4374 Union Road, viewed north.

6.4.6 Existing 70 kV Power Line

Located in Paso Robles immediately east of the Salinas River, the subject structure is a segment of Pacific Gas and Electric's existing 70 kV power line (Figure 26). From the Paso Robles Substation at the intersection of South River Road and Niblick Road, the subject segment runs north for 3.22 circuit miles, roughly paralleling River Road. The line consists of three conductors connected by wood poles, typically spanning 200 to 400 feet. Ranging in height from 50 to 80 feet, the poles feature a variety of arm configurations with both wood and metal cross arms, and post-, suspension-, and strain-type insulators consisting of porcelain disks. Some poles have guy wires to provide additional stability, as well as small wood cross arms situated midway down the pole, which support local, lower voltage transmission lines. The linear feature is part of a larger segment that connects the Paso Robles Substation to the San Miguel Substation to the north. Currently in use and regularly maintained, the line possesses good integrity.

Figure 26. Overview of the Existing 70kV Power Line, viewed north.

6.5 Evaluations

6.5.1 Johnson House (2965 Union Road)

The subject property was constructed by Peter Johnson circa 1890. An immigrant of Sweden, Johnson and his wife Ina arrived to the Paso Robles area in 1888 by way of Minnesota and South Dakota. The couple first settled on a farm near Linne, a community approximately 10 miles east of Paso Robles by Creston Road, but 2 months later purchased an approximately 80-acre parcel of land that included the subject property (Franklin n.d.). Johnson was an industrious individual and set to work constructing a residence for his growing family using bricks he manufactured himself (Farley 1978). The residence was completed circa 1890 and as he improved his own land for cattle and grain cultivation (eventually purchasing an additional 205 acres), he simultaneously recognized a market for building materials in rapidly developing Paso Robles and began to manufacture bricks for sale. These bricks were used to construct a number of extant residences along Park Street in the 1890s and early 1900s (Franklin n.d.). Johnson remained active in the construction of the buildings of Paso Robles until he was accidently killed by a roof that collapsed on him in 1913. The house remained in his family until it was sold to an unrelated Johnson family in 1963, and was eventually left vacant as subsequent property owners constructed another single-family residence on the property in 1977.

The Johnson House is associated with the residential development of Paso Robles in the late–19th century. Although development in Paso Robles through the early 1920s primarily occurred in established neighborhoods near the town center west of Salinas River, the Johnson House was constructed to the east

shortly after development of a bridge crossing the waterway in 1887, and represents a rare example of a brick masonry single-family residence in this rural area of the city (Historic Resources Group 2010:45). In considering the integrity of the property, the replacement of original windows and doors and the removal of an original porch and cistern have affected some aspects of the building's design and materials. The sale and subdivision of the original Johnson land holdings and development of the immediate surrounding area has also affected aspects of the property's association and setting; however, extant late 19th Century residences in Paso Robles are increasingly rare and because of this, a greater degree of alterations is permissible (Historic Resources Group 2010:65). The Johnson House still retains those essential features that enable it to convey its significance, including its square plan, masonry construction, original window and door openings, and central brick chimney. The Johnson House continues to reflect special elements of the historical and architectural development of Paso Robles and as a late 19th century brick masonry residence, embodies the distinctive characteristics of a property type and method of construction that is increasingly rare in Paso Robles. As such, the property appears eligible for listing in the CRHR under Criterion 1 and 3. Although Peter Johnson manufactured bricks that were used in the construction of a number of extant buildings in Paso Robles, he does not appear to be demonstrably important within the historic context of early development of Paso Robles. He is not identified as a notable individual in the 2010 *City of Paso Robles Historic Context Statement* and the extent to which he provided bricks for the construction of local buildings could not be confirmed through primary-source archival research. As such, the property does not appear eligible for CRHR listing under Criterion 2. Research also does not suggest that the property has the potential to yield information important in history (Criterion 4).

6.5.2 3310 Union Road

The primary residence and two adjacent outbuildings at 3310 Union Road were constructed in 1940 by Paul R. Bassett (San Luis Obispo County Assessor 2016). Born in California 1902, Bassett was a grain farmer who lived in the residence with his wife Helen, brother Caryl, mother Gertrude, and his two daughters (Ancestry.com 2012). Bassett sold the property in 1949 to Duane E. Mitchell, a rancher who lived at the property with his family through his death in 1994 (Ancestry.com 2011). Following Mitchell's death, the property was eventually sold to Dennis Bradshaw in 1998, who at that time constructed the secondary residence at 3450 Union Road (San Luis Obispo County Clerk-Recorder 2016a).

The property at 3310 Union Road is not eligible for listing in the CRHR individually under any of the applicable eligibility criteria. It was one of numerous Ranch-style residential properties that developed east of Salinas River in Paso Robles in the years around World War II. Archival research did not identify any significant associations with events or persons, including the Bassett or Mitchell families, and the Ranch-style residence is a ubiquitous property type in Paso Robles and California that does not possess high artistic values (Criteria 1, 2, and 3). Research also does not suggest that the property has the potential to yield information important in history (Criterion 4).

6.5.3 3510 Union Road

The Ranch-style residence at 3510 Union Road was constructed in 1948 by George and Orba Williams. Both Born in California in the 1910s, the Williams were living in King City as of 1940 where George was employed as a mechanic (Ancestry.com 2012). Archival research failed to identify extensive information on the Williams and by 1951 they had sold the property to Louis and Ava George (San Luis Obispo County Clerk Recorder 2016b). Ownership of the property changed frequently over the next decade and in 1962 it was purchased by Don and Virginia Brandon, who developed the secondary house at 3530 Union Road in 1964. The property remained in the Brandon family through at least 2012 and as of 2016 ownership has transferred to the Georgia R. Collins Trust (San Luis Obispo County Assessor 2016; San Luis Obispo County Clerk-Recorder 2016b).

The residential property at 3510 Union Road does not appear eligible for listing in the CRHR under any applicable eligibility criteria. It was one of numerous Ranch-style residential properties that developed east of Salinas River in Paso Robles in the years after World War II. Archival research did not identify any significant associations with events or persons, including the Williams or Brandon families, and the two Ranch-style residences are a ubiquitous property type in Paso Robles and California that does not possess high artistic values (Criteria 1, 2, and 3). Research also does not suggest that the property has the potential to yield information important in history (Criterion 4).

6.5.4 3570 Union Road

Although visual observation suggests that the ancillary buildings at the rear (north) of the 3570 Union Road property appear to date to the early 20th century, historical aerial photographs and information on file with the San Luis Obispo County Assessor confirm that the first buildings did not appear on the parcel until at least 1962, suggesting they may have been moved from an unknown location (San Luis Obispo County Assessor 2016; Environmental Data Resources 2016). By this time the property was owned by Robert D. Berry, who purchased it from E.M Harvell in 1953 (San Luis Obispo County Clerk-Recorder 2016c). Born in Wyoming in 1924, Berry was a cook that was living in Paso Robles as early as 1943 (Ancestry.com 2005). Berry appears to have constructed the primary residence in 1962 and owned the property until his death in 2008, at which time it was transferred to a trust in his name through 2016, when it was purchased by the current owner Barbara Jean Romero.

The property at 3570 Union Road is not eligible for listing in the CRHR under any of applicable eligibility criteria. Although visual observation suggests some of the buildings on the property may date to the early 20th century, they appear to have been relocated to their current location when the property was developed in the 1960s. Research did not reveal that the property has a direct and important association with historic events nor suggest that Robert D. Berry or any other individuals associated with the property are significant in the history of the city, region, state, or nation (Criteria 1 and 2). In addition, the relocation of some of the buildings in the 1960s has negatively affected their integrity such that they are unable to convey any significant associations with early 20th century residential architecture in Paso Robles. Because of their relocation, they are also not representative of post-World War II architecture in Paso Robles and do not embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, nor possess high artistic values (Criterion 3). Research does not suggest that the property has the potential to yield information important in history (Criterion 4).

6.5.5 4374 Union Road

Archival research indicates that the primary residence at 4374 Union Road was constructed in 1920 and by the following year the property was owned by Carl H. Weaver (San Luis Obispo County Assessor 2016; Paso Robles Township and Range Map 1921). Census data indicates that Weaver was approximately 3 years old in 1921, suggesting the property may have been placed in his name by his father Percy N. Weaver, a farmer who was born in California in 1895 (Ancestry.com 2010). A review of census data, voter registries, and other archival materials was unable to provide substantial information on Percy Weaver. Ownership of the property transferred to Franklin C. Clothier prior to 1932, but was soon sold to chicken farmer Sidney V. Saddler in 1934 (San Luis Obispo County Clerk-Recorder 2016d). The property remained in the Saddler family until 1943, when it was sold again to its original-listed owner Carl H. Weaver, who by that time was approximately 26 years old and married to Phyllis L. Weaver. Although Carl H. Weaver died in 1978, the property remained under the ownership his wife Phyllis through 1986, when it was sold to its current owner Daniel A. Blake. Blake added the large secondary residence and pool to the property in 1989 and subsequently planted vineyards on the property in the early 2000s (Environmental Data Resources 2016; San Luis Obispo County Clerk-Recorder 2016d).

The property does not appear eligible for listing in the CRHR under any applicable criteria. The primary residence dates to 1920 and is associated with early residential and agricultural growth in the area east of Paso Robles. However, any potential significance the property may have for these associations can no longer be conveyed due to large additions to the primary residence, the construction of the secondary residence in 1989, and the planting of vineyards in the early 2000s, all of which have negatively affected the integrity of the property. As such, the property does not appear eligible for any associations with significant events or as a representation of early 20th century residential architecture in Paso Robles (Criteria 1 and 3). Further, archival research did not identify the Weavers, Saddlers, or any other property owners as persons that may be considered significant within our past and the property does not appear to have the potential to yield information (Criteria 2 and 4).

6.5.6 Existing 70 kV Power Line

As recorded, the subject segment is a 3.22-mile portion of an existing 70kV power line, which runs between San Miguel Substation to the north and Paso Robles Substation to the south. The subject segment, San Miguel and Paso Robles Substations, and nearby Morro Bay Power Plant were constructed in the mid-1950s as part of a larger electrical system, one of many that were developed and expanded in the years after World War II to support the growing energy needs of California's rapidly increasing population (Williams 1997). Since its construction, the power line has been in continual operation and subject to routine maintenance.

The power line segment does not appear eligible for listing in the CRHR under any applicable criteria. In considering the historical significance of the subject segment, it is a wood-pole power line constructed in the 1950s as Pacific Gas and Electric Company expanded its systems across the state. It was not the first power line constructed in Paso Robles, where electricity had first arrived in the late 19th century, and it was one of many such lines developed in the post-World War II era in response to rapidly increasing energy demands. The subject segment does not appear to be directly associated with any advance in electric generation or transmission that has made a significant contribution to the broad patterns of our history (Criterion 1). Archival research did not identify any associations with the lives of persons important to local or state history (Criterion 2). As a wood-pole power line, the subject segment does not represent any innovations in transmission technology and does not embody the distinctive characteristics of a type, period, or method of construction, nor represent the work of a master (Criterion 3). Finally, there is no reason to believe that the power line segment may yield important information about prehistory or history (Criterion 4).

6.5.7 Archaeological Sites and Isolates

Archaeological sites 36052-S-001, 36052-S-002, and 36052-S-003 have not been evaluated for CRHR eligibility. The geoarchaeological sensitivity analysis indicates the majority of the study area has low potential for the presence of buried soils that may contain archaeological deposits or artifacts. The exceptions are small areas of moderate sensitivity along Salinas River and areas along Huerhuero Creek (see Figure 3).

Isolated artifacts lack the context that is afforded to artifacts within an archaeological site, such as contemporary and associated artifacts, ecofacts, and features. Without this context, isolates typically lack the potential to yield information important in prehistory, the CRHR Criterion (4) under which archaeological resources are most often found to be significant. As such, the isolates identified by this study are not eligible for the CRHR. They do not constitute unique archaeological resources, as they do not contain information needed to answer important scientific research questions; they do not have a special and particular quality such as being the oldest of its type or the best available example of its type; and are not directly associated with a scientifically recognized important prehistoric or historic event or person.

Consequently, these resources are not considered historically significant under CEQA, and no further consideration is warranted.

7 SUMMARY

Archaeologists and historians conducted archival research, Native American coordination, a cultural resources survey of the study area, and prepared this technical report documenting the results of the inventory.

Results of the CHRIS records search revealed that 71 previous cultural resource studies have been conducted within a 0.5-mile radius of the study area. Of these studies, 21 overlap with the current study area. The CHRIS records search also identified 37 previously recorded cultural resources within a 0.5-mile radius of the study area. Of these resources, only two isolates (P-40-038110 and P-40-038111) are plotted by the CCIC as being within the study area. These were not relocated during the survey effort. The cultural resources investigation identified 16 new resources in the study area. These include two historical archaeological sites (36052-S-001; 36052-S-002), one prehistoric archaeological site (36052-S-003), seven isolated prehistoric artifacts (36052-ISO-002; 36052-ISO-003; 36052-ISO-004; 36052-ISO-005; 36052-ISO-006; 36052-ISO-007; 36052-ISO-008), and six built environment resources.

Archaeological site 36052-S-001 consists of a historical well feature and utility pole with remnant glass insulators. Site 36052-S-002 is a historical dump consisting of a mixed redeposit of historical and modern refuse along with disused farm equipment. Site 36052-S-003 is a low-density prehistoric lithic and shell scatter consisting of approximately 30 Monterey chert flakes and three marine shell fragments. The isolated artifacts identified include seven prehistoric isolates. The built environment resources include the Johnson House (2965 Union Road), 3310 Union Road, 3510 Union Road, 3570 Union Road, 4374 Union Road, and the existing 70 kV Power Line.

The Johnson House (2965 Union Road) is recommended eligible for listing in the CRHR under Criteria 1 and 3, as the ca. 1890 masonry residence reflects special elements of the historical and architectural development of Paso Robles and embodies the distinctive characteristics of a style, type, and method of construction; it is therefore considered a historical resource for the purposes of CEQA. The evaluation status for all identified resources within the study area are summarized in Table 6.

Table 6. Summary of Evaluations

Primary # or Temporary Designation	Resource Type	Intersecting Project Components	Evaluation
36052-ISO-002	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-003	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-004	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-005	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-006	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-007	Prehistoric Isolate	New 70 kV Power Line	Not eligible
36052-ISO-008	Prehistoric Isolate	New 70 kV Power Line	Not eligible

Table 6. Summary of Evaluations

Primary # or Temporary Designation	Resource Type	Intersecting Project Components	Evaluation
36052-S-001	Historic-era Archaeological Site	New 70 kV Power Line	Not Evaluated
36052-S-002	Historic-era Archaeological Site	New 70 kV Power Line	Not Evaluated
36052-S-003	Prehistoric Archaeological Site	New 70 kV Power Line	Not Evaluated
Johnson House (2965 Union Road)	Historic-era Residential Property	New 70 kV Power Line	CRHR Eligible
3310 Union Road	Historic-era Agricultural Property	New 70 kV Power Line	Not eligible

RE: The Proposed Estrella Substation Interconnection Project, San Miguel, Paso Robles, Templeton, Estrella, and Creston USGS Quadrangles, San Luis Obispo County, California

To whom it may concern:

Attached is a consultation list of tribes with traditional lands or cultural places located within the boundaries of the above referenced counties. Please note that the intent above reference codes is to mitigate impacts to tribal cultural resources, as defined, for California Environmental Quality Act (CEQA) projects.

As of July 1, 2015, Public Resources Code Sections 21080.3.1 and 21080.3.2 require public agencies to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose mitigating impacts to tribal cultural resources:

> Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the **lead agency** shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section. (Public Resources Code Section 21080.3.1(d))

The law does not preclude agencies from initiating consultation with the tribes that are culturally and traditionally affiliated with their jurisdictions. The NAHC believes that in fact that this is the best practice to ensure that tribes are consulted commensurate with the intent of the law.

In accordance with Public Resources Code Section 21080.3.1(d), formal notification must include a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation. The NAHC believes that agencies should also include with their notification letters information regarding any cultural resources assessment that has been completed on the APE, such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

   - A listing of any and all known cultural resources have already been recorded on or adjacent to the APE;
   - Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
   - If the probability is low, moderate, or high that cultural resources are located in the APE.
   - Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the potential APE; and

- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

   - Any report that may contain site forms, site significance, and suggested mitigation measurers.

     All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure in accordance with Government Code Section 6254.10.

3. The results of any Sacred Lands File (SFL) check conducted through Native American Heritage Commission. A search of the SFL was completed for the USGS quadrangle information provided with negative results.

4. Any ethnographic studies conducted for any area including all or part of the potential APE; and

5. Any geotechnical reports regarding all or part of the potential APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of a cultural place. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the case that they do, having the information beforehand well help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance we are able to assure that our consultation list contains current information.

If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

MEETING SUMMARY

Project: Estrella Substation and Paso Robles Area Reinforcement Project

Meeting: Tribal Outreach Meeting – Salinan Tribe of Monterey and San Luis Obispo Counties

Location: SWCA San Luis Obispo

Attending: Patti Dunton, Tribal Administrator, Salinan Tribe of Monterey and San Luis Obispo Counties
Matt Armstrong, Cultural Resources Specialist, PG&E
Carolyn Stewart, Director of Tribal Relations, NextEra Energy
Leroy Laurie, Cultural Resources Specialist, SWCA
Chad Jackson, Cultural Resources Specialist, SWCA

SUMMARY/HIGHLIGHTS

An outreach meeting was held with the Salinan Tribe of Monterey and San Luis Obispo Counties on August 23, 2016 at 2 pm. The meeting was initiated with attendee introductions and roles. PG&E and NEET West provided a brief project overview. Patti Dunton indicated that the tribe established a non-profit organization under which all tribal monitoring is conducted and that John Burch is the "Traditional Lead" for the tribe.

Ms. Dunton noted that the general area around the Santa Ysabel Ranch is very sensitive. Ms. Dunton asked about the findings of the field surveys conducted by SWCA and whether or not any Phase II evaluations were anticipated. She indicated she would like to have a tribal representative from her tribe on-site. No Phase II evaluations were required for the project.

Ms. Dunton requested technical report copies when they became available and indicated that she would review the project in greater detail, review the tribe's information on areas where Native American human remains have been identified, and in some cases, repatriated.

MEETING SUMMARY

Project: Estrella Substation and Paso Robles Area Reinforcement Project

Meeting: Tribal Outreach Meeting – Xolon Salinan Tribe

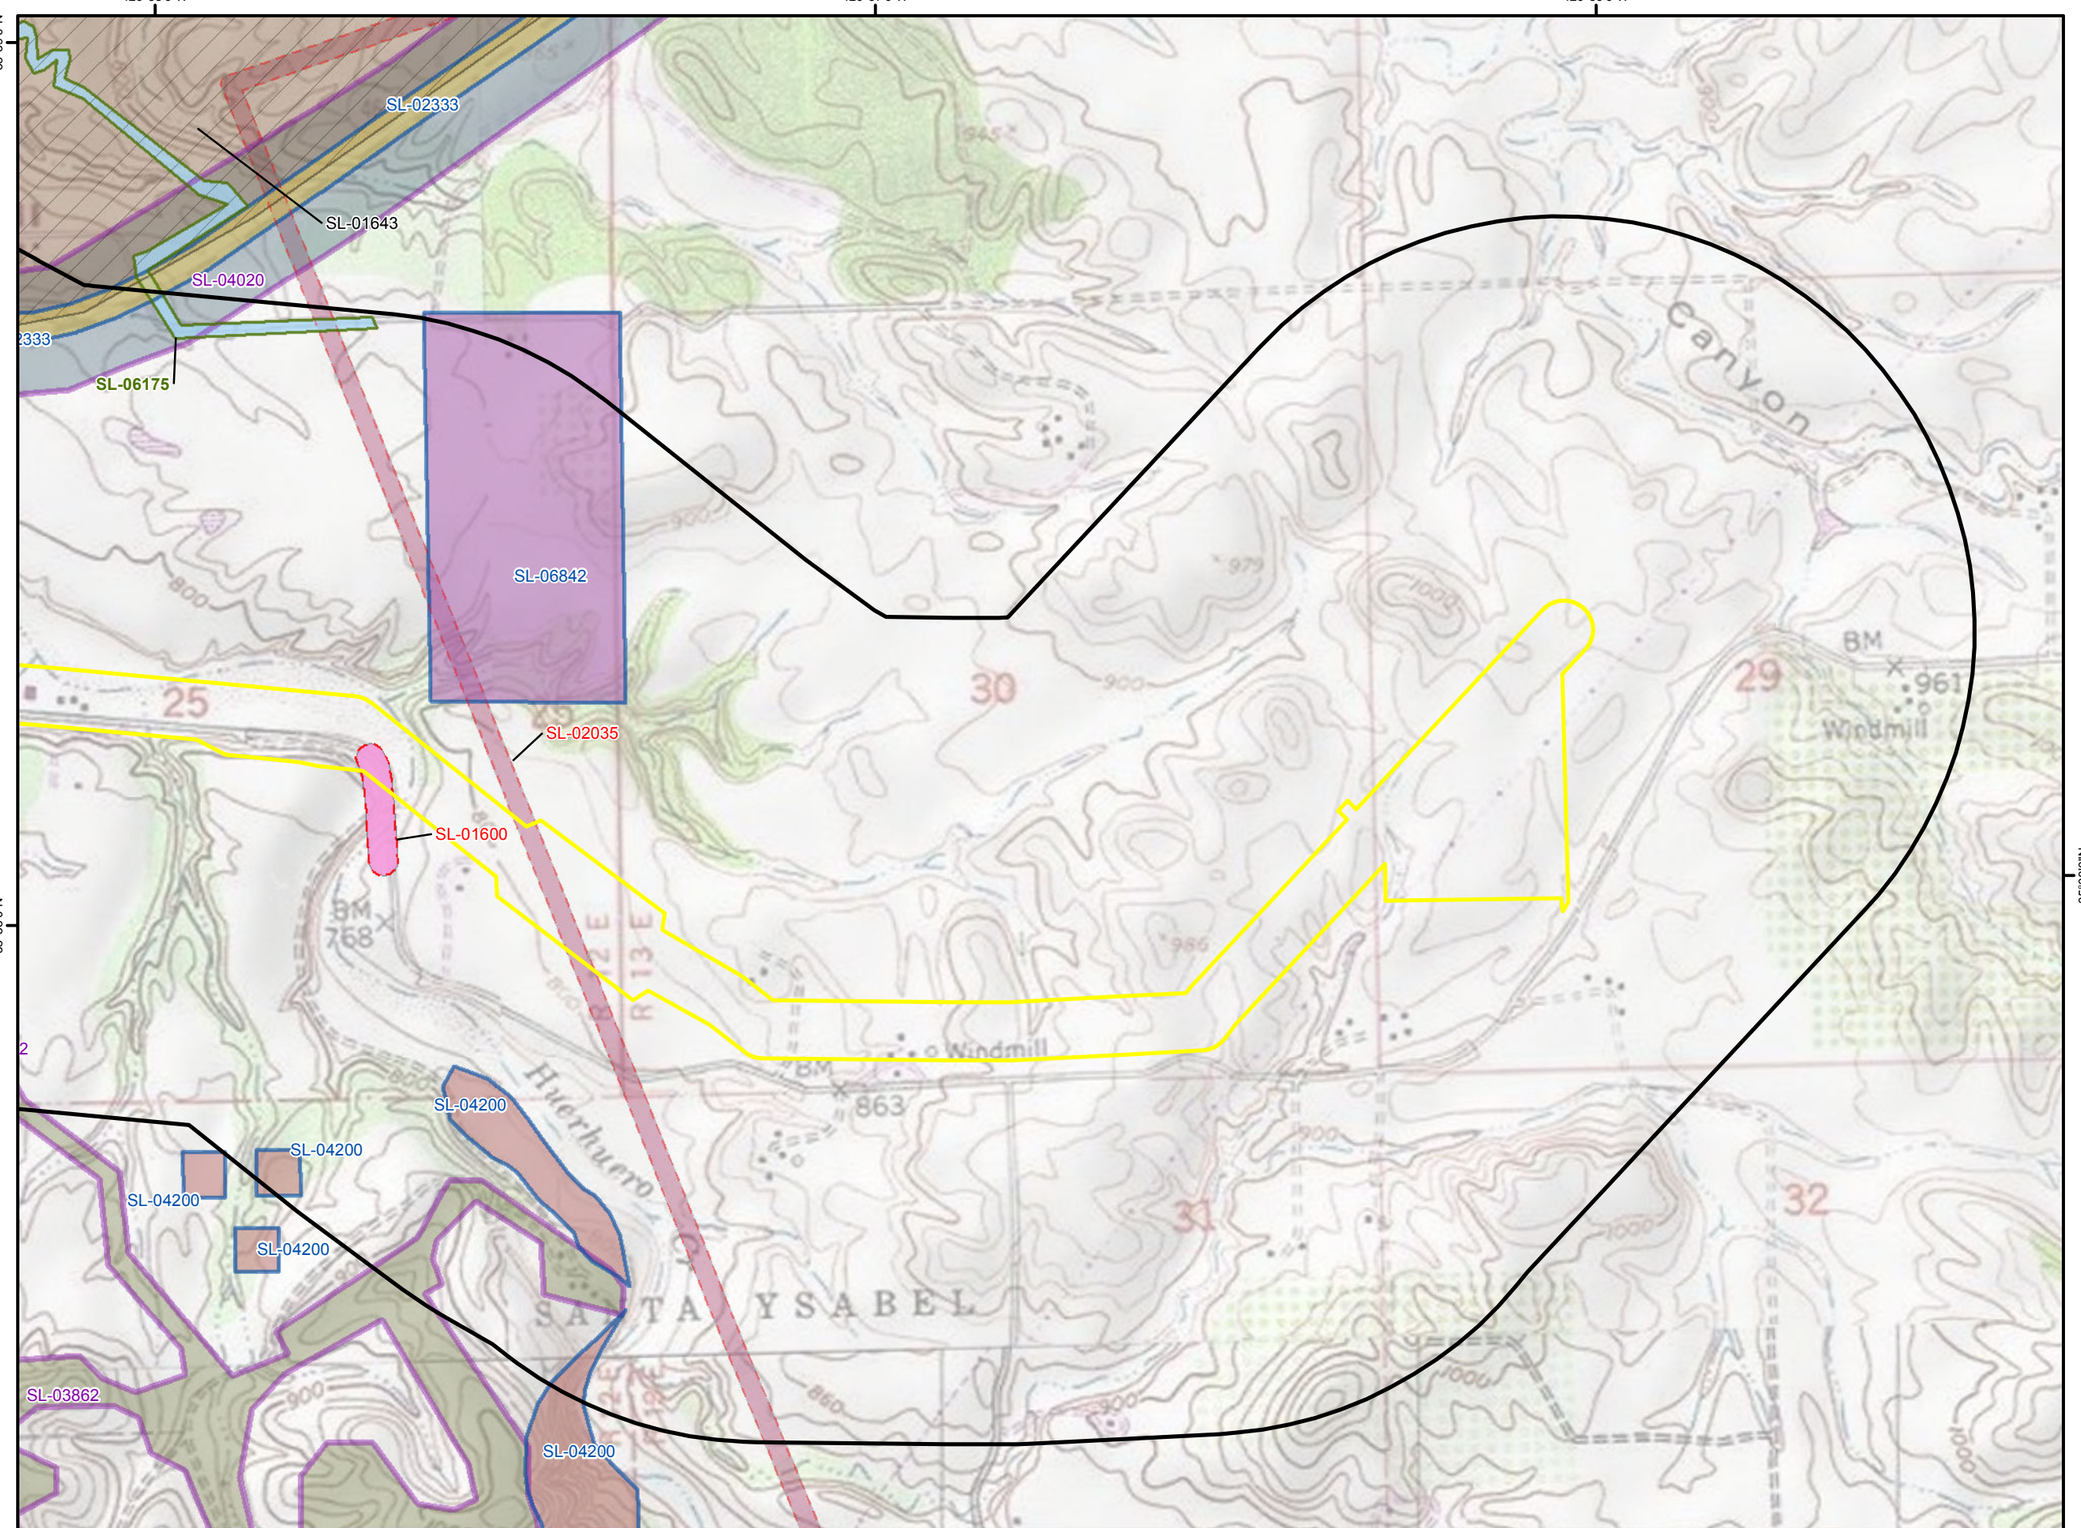
Location: SWCA San Luis Obispo

Attending: Karen White, Council Chair, Xolon Salinan Tribe
Donna Haro, Tribal Headwoman, Xolon Salinan Tribe
Karen Fontanetta, Xolon Salinan Tribal Cultural Resources Consultant
Matt Armstrong, Cultural Resources Specialist, PG&E
Carolyn Stewart, Director of Tribal Relations, NextEra Energy
Leroy Laurie, Cultural Resources Specialist, SWCA

SUMMARY/HIGHLIGHTS

An outreach teleconference was held with the Xolon Salinan Tribe on August 23, 2016 at 4 pm. The teleconference was initiated with attendee introductions and roles. PG&E and NEET West provided a brief project overview. Donna Haro asked about the types of ground disturbance associated with the installation of a new power line route and at the substation location.

Ms. Haro indicated that the areas along Estrella River and Salinas River are sensitive and known Xolon Salinan affiliated cultural resources have been identified in multiple locations. Ms. Fontanetta noted that Dry Creek was used as a travel corridor by the tribe and the Dry Creek area is within traditional tribal land.



Ms. Haro stated that deep excavations near the substation have higher potential to encounter cultural resources and that a tribal monitor should be present during ground disturbance in this area. Karen Fontanetta thought that the substation site is within the historic Steinbeck Vineyard. Further research indicated the substation site is not within the historic Steinbeck Vineyard (see Figure 6 in the Substation Cultural Resources Technical Report, Cultural Resource Survey Results Map). In addition, subsequent buried site sensitivity analysis showed the substation site has low potential to contain buried archaeological sites. Ms. Fontanetta noted that an old school is depicted on a 1917 government map to the northeast of the substation site. The project will have no impacts to this school, which was not identified in the cultural resources study area for the project.

Ms. Haro asked about the findings of the field surveys conducted by SWCA and whether or not any Phase II evaluations were anticipated. She indicated she would like to have a tribal representative from her tribe on-site for any Phase II evaluations. No Phase II evaluations were required for the project. Ms. Haro indicated they would wait to provide specific comments.

Estrella Substation and Paso Robles Area Reinforcement Project Paleontological Resources Technical Report for the 70 kV Power Line San Luis Obispo County, California

Prepared for

Pacific Gas and Electric Company
1455 East Shaw Avenue
Fresno, California 93760
Attn: Tom Johnson

Prepared by

SWCA Environmental Consultants
60 Stone Pine Road, Suite 100

EXECUTIVE SUMMARY

A Paleontological Resources Technical Report (PRTR) has been prepared for the 70 kilovolt (kV) power line component of the Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by the Pacifica Gas and Electric Company (PG&E) and NextEra Energy Transmission West, LLC. PG&E proposes to construct and operate approximately 7 miles of new overhead 70 kV double-circuit power line between Estrella Substation and an existing 70 kV power line, and reconductor approximately 3 miles of the existing 70 kV power line from the point of connection to the existing Paso Robles Substation in the city of Paso Robles. PG&E will undertake this portion of the project

A paleontological resource study was conducted to evaluate the paleontological sensitivity of the project. This report presents the results of the paleontological records search, literature review, resource assessment, and field investigation completed for the 70 kV power line portion of the project. The museum records searches were performed between April 14 and 19, 2016. The field investigation of the project area was performed from May 16–17, 2016. This technical report was completed in October 2016.

Geologic mapping by Dibblee and Minch (2004a, 2004b) indicates that the area surrounding the 70 kV power line is underlain by four geologic units: Holocene valley alluvial sands, Holocene stream alluvial sand and gravel (0.01 million years ago [Ma]), Pleistocene older alluvial sediments (0.01–2.6 Ma), and Pleistocene to latest Pliocene Paso Robles formation (2.6–3.6 Ma). Museum collections records maintained by the Natural History Museum of Los Angeles County and the University of California, Museum of Paleontology indicate that one previously recorded fossil locality exists within a 1-mile radius of the project site boundaries and seven fossil localities have been recorded within a 15-mile radius of the 70 kV power line. No fossils were discovered during the field investigation. The combined results of the museum records searches, literature review, and field investigation indicate that the Potential Fossil Yield Classifications (PFYC) of the geologic units underlying the 70 kV power line range from Low (PFYC 2) to High (4b) (U.S. Bureau of Land Management 2007).

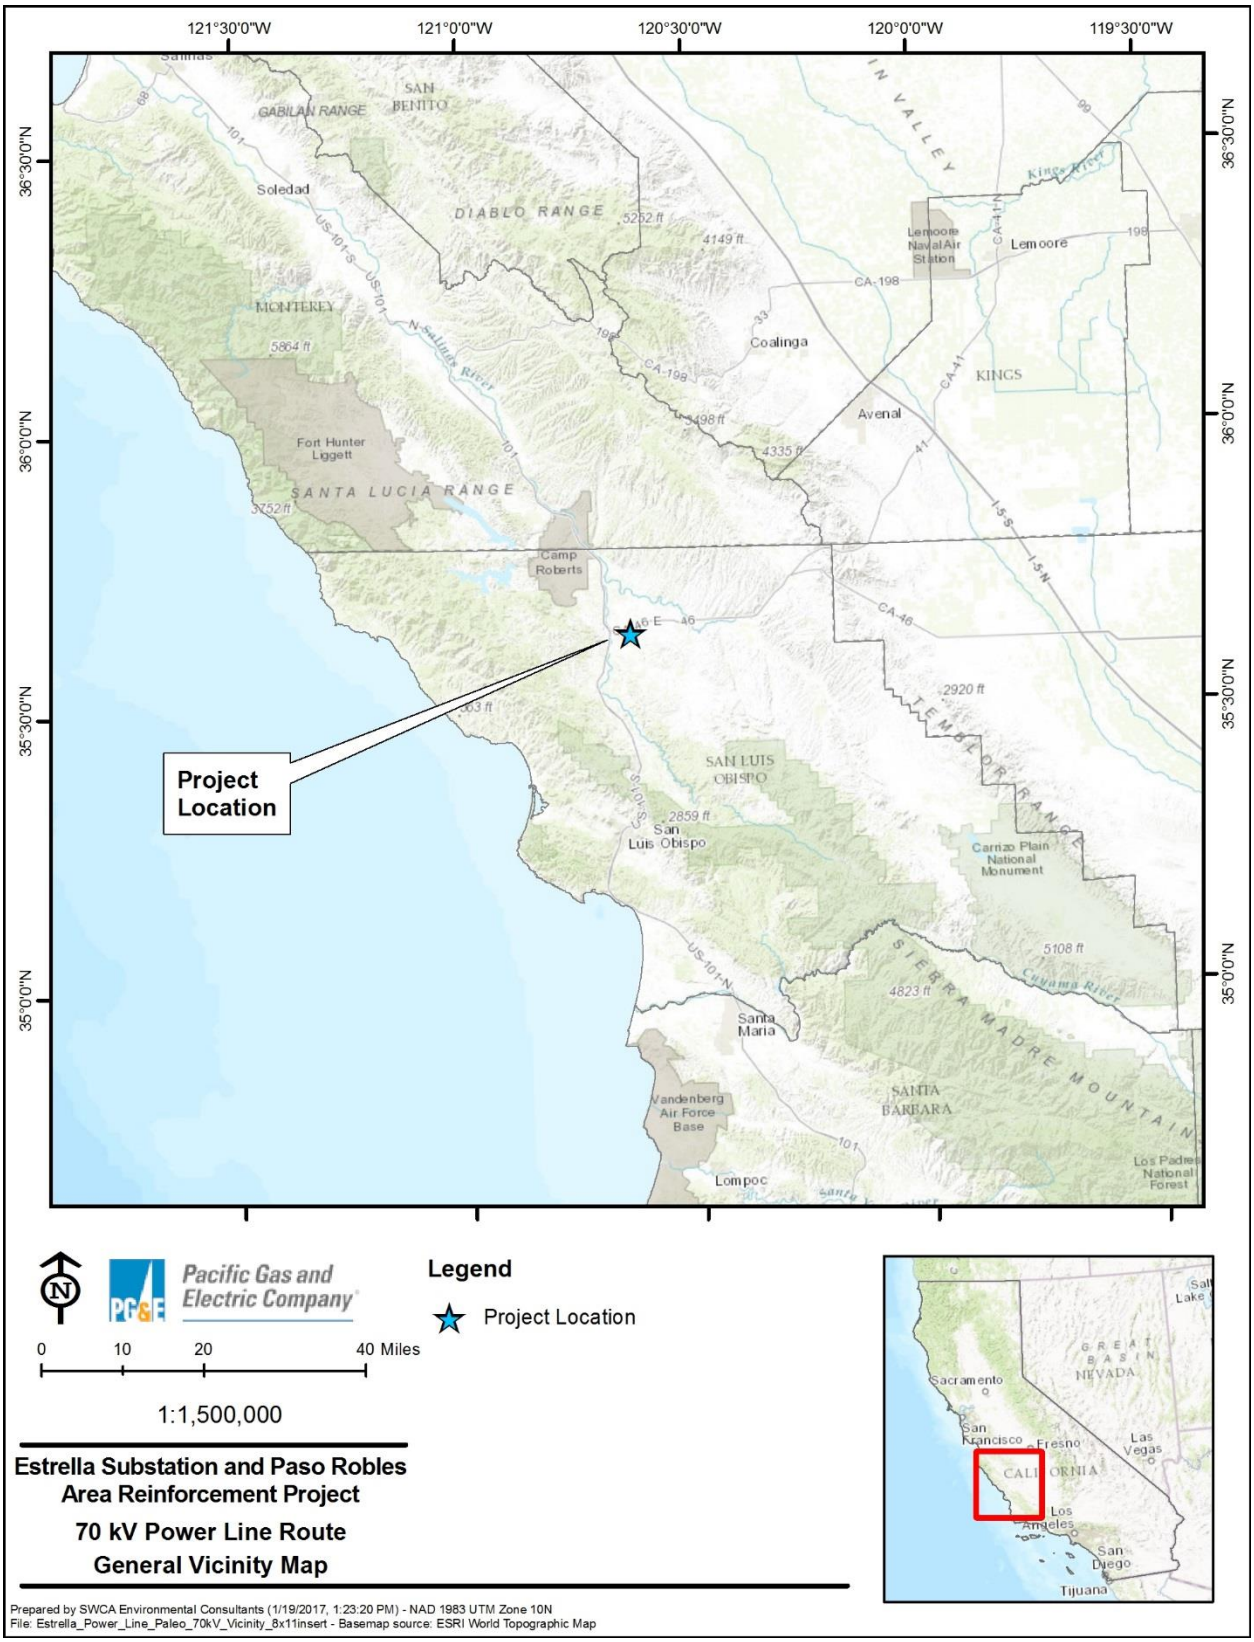
1 INTRODUCTION

Pacific Gas and Electric Company (PG&E) proposes to construct a new approximately 7-mile double-circuit 70 kilovolt (kV) power line and reconductor approximately 3 miles of existing power line in the Paso Robles area of San Luis Obispo County, California (Figure 1). PG&E is undertaking this effort as part of the larger Estrella Substation and Paso Robles Area Reinforcement Project (project) proposed jointly by PG&E and NextEra Energy Transmission West, LLC.

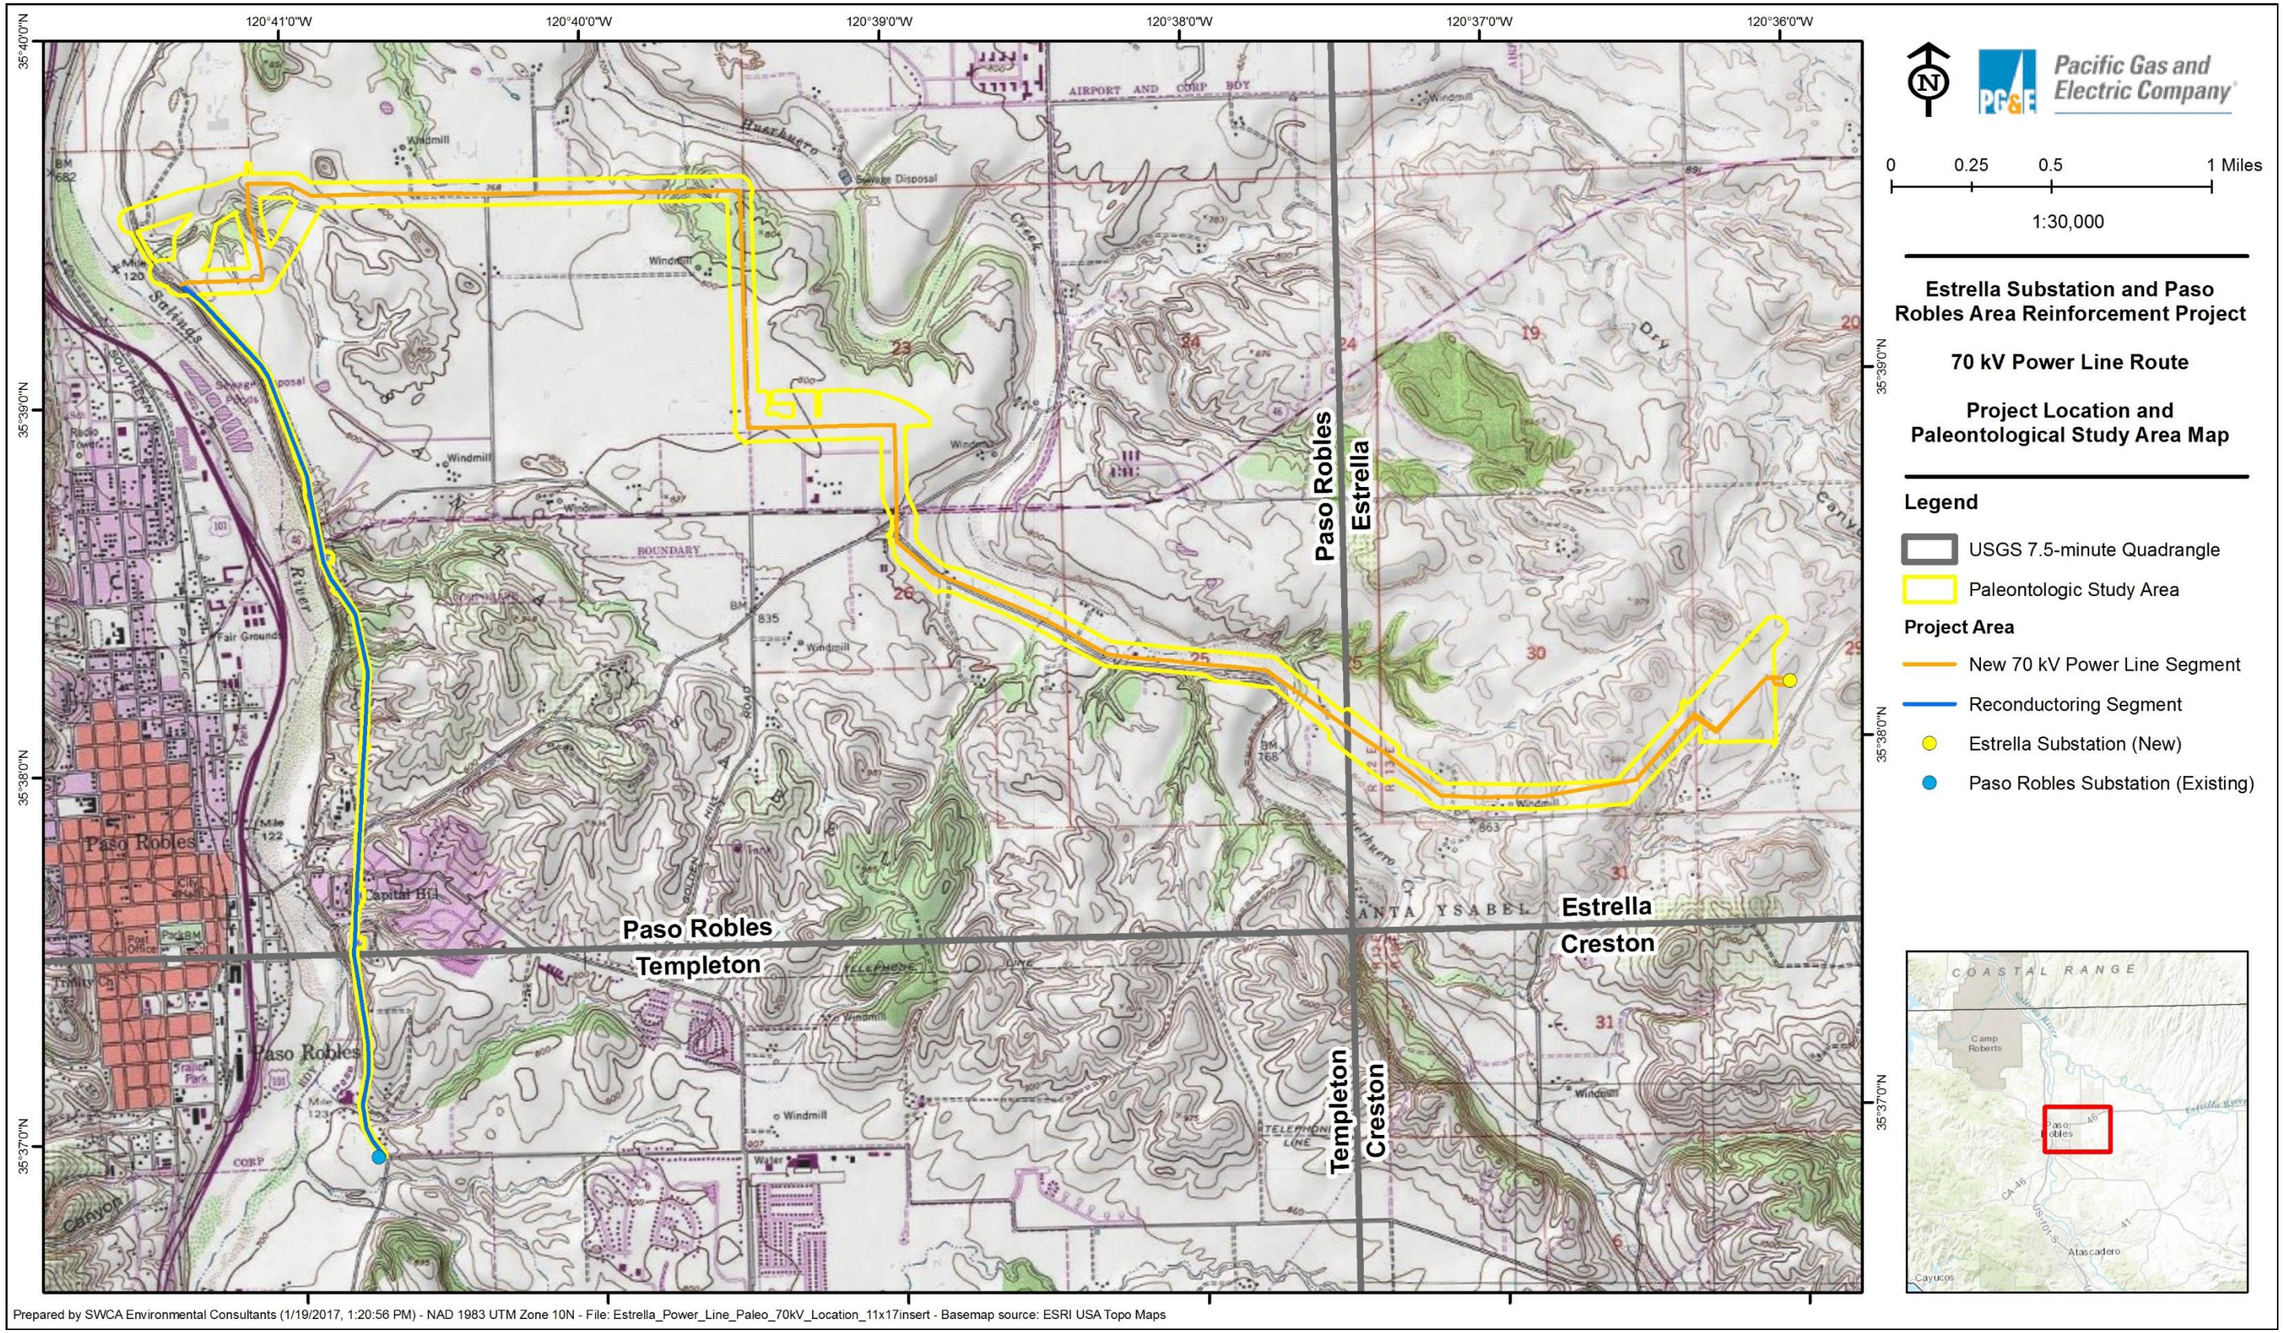
A Paleontological Resources Technical Report (PRTR) was prepared to evaluate the paleontological sensitivity of the power line portions of the project. This study was conducted in accordance with professional guidelines established by the Society of Vertebrate Paleontology (SVP) (1995, 2010) and the U.S. Bureau of Land Management (BLM) (2007). The structure and content of this report were developed in consultation with PG&E's paleontological guidelines (2015). A similar report has been prepared for the substation component of the project, referred to as Estrella Substation, and the results of that effort are presented under separate cover.



1.1 Project Location

The project is located within the northern portion of San Luis Obispo County, California, including portions of the city of Paso Robles (Figures 1 and 2). The power line consists of a new, approximately 7-mile-long 70 kV power line between Estrella Substation and an existing 70 kV power line (new power line segment) and the reconductoring of approximately 3 miles of the existing line from the point of connection to Paso Robles Substation (reconductoring segment).

1.2 Project Components



The new 70 kV power line and reconductoring segments will use a combination of tubular steel poles and light-duty steel poles. A common neutral will be collocated along the entire length from Estrella Substation to Paso Robles Substation. A fiber optic line for communication services will be installed on the 70 kV power line to provide a fiber optic link between Estrella Substation and Paso Robles Substation. In locations where existing distribution lines are located in close proximity to the power line alignment, the distribution conductors may be collocated on the power line structures.

2 REGULATORY BACKGROUND

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under federal (Paleontological Resources Preservation Act [PRPA]), state (California Environmental Quality Act [CEQA]; California Public Resources Code [PRC]), and county (County of San Luis Obispo General Plan) laws, ordinances, and regulations. This study satisfies project requirements in accordance with CEQA (Title 14, Division 6, Chapter 3, California Code of Regulations [CCR]: 15000 et seq.), and PRC (Chapter 1.7) Sections 5097.5 and 30244. The SVP (1995, 2010) has established professional standards for the assessment and mitigation of adverse impacts to paleontological resources. The following sections describe specific laws, ordinances, and regulations that are applicable to the 70 kV power line.

2.1 Federal

A federal agency is not approving, implementing, or funding the project or any element of it; therefore, federal ordinances and regulations would not apply to this project.

2.2 State

2.2.1 California Environmental Quality Act

State guidelines for the implementation of CEQA, as amended March 29, 1999 (Title 14, Division 6, Chapter 3, CCR 15000 et seq.) define procedures, types of activities, persons, and public agencies required to comply with CEQA. The guidelines include as one of the questions to be answered in the Environmental Checklist (Appendix G, Section V, Part c) the following: "*Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?*"

CEQA includes in its definition of historical resources, "any object [or] site …that has yielded or may be likely to yield information important in prehistory" (14 CCR 15064.5[3]), which is typically interpreted as including fossil materials and other paleontological resources. More specifically, destruction of a "unique paleontological resource or site or unique geologic feature constitutes a significant impact under CEQA" (State CEQA Guidelines Appendix G). CEQA does not provide an explicit definition of a "unique paleontological resource," but a definition is implied by comparable language within the act relating to archeological resources: "The procedures, types of activities, persons, and public agencies required to comply with CEQA are defined in: Guidelines for the Implementation of CEQA, as amended March 29, 1999" (Title 14, Chapter 3, CCR 15000 et seq.).

CEQA encourages the protection of all aspects of the environment by requiring state and local agencies to prepare multidisciplinary analyses of the environmental impacts of a proposed project, and to make decisions based on the findings of those analyses. Treatment of paleontological resources under CEQA is generally conducted according to guidance from the SVP or other agencies (BLM, etc.) and typically includes identification, assessment, and development of mitigation measures for potential impacts to significant or unique resources.

Appendix G (Part V) of the State CEQA Guidelines provides guidance relative to significant impacts on paleontological resources, which states, "a project will normally result in a significant impact on the environment if it will … disrupt or adversely affect a paleontological resource or site or unique geologic feature, except as part of a scientific study."

2.2.2 California Public Resources Code

The PRC (Chapter 1.7, Sections 5097.5 and 30244) includes additional state level requirements for the assessment and management of paleontological resources. These statutes require reasonable mitigation of adverse impacts to paleontological resources resulting from development on state lands, define the removal of paleontological sites or features from state lands as a misdemeanor, and prohibit the removal of any paleontological site or feature from state land without permission of the applicable jurisdictional agency.

PRC Section 30244 requires reasonable mitigation for impacts on paleontological resources that occur as a result of development on public lands. Further, the California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources.

2.3 Local

Because the California Public Utilities Commission has exclusive jurisdiction over the siting, design, and construction of the project, the project is not subject to local discretionary regulations.

3 METHODOLOGY

3.1 Professional Standards

While there is no professional certification for the practice of mitigation paleontology, multiple agencies, professional organizations, and individual paleontologists have developed guidelines for best practices in mitigation paleontology.

The SVP is the largest professional organization of paleontologists and has established standard guidelines that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation (1995, 2010). Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as described in the standard guidelines of the SVP. Typically, state regulatory agencies accept and use the professional standards set forth by the SVP.

BLM has also developed a comprehensive set of guidelines for the protection of fossil resources in land-use planning, analysis of potential impacts to fossil resources, development of sensitivity rankings, mitigation and monitoring, and permitting (BLM 2007). Furthermore, a small but significant body of scientific literature exists regarding best practices in paleontological mitigation (Knauss et al. 2014; Murphey et al. 2014) and case studies of successful mitigation projects (for example, see Benson 1998; Haasl et al. 2009; Dundas et al. 2013; Tomassi et al. 2015).

PG&E has compiled a variety of professional standards from some of these sources into a brief collection of guidelines regarding the assessment of paleontological sensitivity and the development of mitigation guidelines (2015).

3.2 Literature Review and Records Search

The 70 kV power line was the subject of thorough background research and analysis, including geologic map and literature reviews, aerial photography, and records searches from the University of California Museum of Paleontology (Finger 2016) and the Natural History Museum of Los Angeles County (McLeod 2016). The purpose of the literature review was to evaluate the paleontological sensitivity of the 70 kV power line in order to identify known fossil resources within it or nearby in the same geologic formations. The records searches were requested for any previously recorded fossil localities in the power line footprint

or within a 1-mile radius. Geotechnical data for the 70 kV power line was also available (Appendix M to the PEA). These data were combined to develop paleontological sensitivity rankings for the geologic units present in and around the 70 kV power line.

3.3 Field Inspection

The field inspection was designed to determine the presence of paleontologically sensitive geologic units along the 70 kV power line, both on the land surface and, if possible, in the subsurface. Figure 2 shows the area covered by the field survey. Paleontological surveys are largely dependent on local environmental factors, including topography, erosion, vegetation cover, and human development. Typically, survey routes follow the landscape, with focus given to areas where washes and channels dissect surface deposits and expose layered strata. Because washes collect and concentrate fossils eroded from channel banks, it is more likely they will be observed in these areas, which are also generally free of the soils which may cover fossils. Therefore, the field survey was limited to areas with potential exposure of fossiliferous deposits.

The field survey was conducted by paleontologists between May 16 and 17, 2016. The surveyed area covered the 70 kV power line (Figure 2), as well as potentially informative outcrops in the near vicinity, and did not discover any new paleontological localities. This survey was focused on identifying: 1) surface fossils; 2) exposures of potentially fossiliferous rock; and 3) areas in which fossiliferous rock may be exposed or otherwise impacted during construction. Due to the current agricultural and urban development over large portions of the project area, localities nearby, but outside of the project footprint, that exposed the surface and subsurface geology were also examined.

4 RESULTS

4.1 Literature Review

4.1.1 Geologic Setting

California comprises the following twelve geomorphic provinces, each distinguished from one another by having unique topographic features and geologic formations: (1) the Sierra Nevada; (2) the Klamath Mountains; (3) the Cascade Range; (4) the Modoc Plateau; (5) the Basin and Range; (6) the Mojave Desert; (7) the Colorado Desert; (8) the Peninsular Ranges; (9) the Transverse Ranges; (10) the Coast Ranges; (11) the Great Valley; and (12) the Offshore area (Norris and Webb 1990). The 70 kV power line is located within the central Coast Ranges province, which is bounded to the north by the Klamath Mountains, to the east by the Great Valley, and to the south by the Transverse Ranges (Norris and Webb 1990). The Coast Ranges occupy the Pacific Coast of California from the northern border with Oregon to a point just north of Santa Barbara, a distance of around 590 miles (Norris and Webb 1990). Mountains in the Coast Ranges vary from 2,000 to 6,000 feet above sea level and trend north-west, roughly following the San Andreas Fault (Norris and Webb 1990).

The rocks of the Coast Ranges province are a thick series of Mesozoic and Cenozoic sedimentary strata overlying either the bedrock granites in the Salinian block or the metamorphosed Franciscan complex (Harden 2004). The Franciscan subduction complex consists of metamorphosed sedimentary rocks derived from the rapid erosion of volcanic uplands and their subsequent deposition in deep marine basins during the middle Jurassic (150–165 million years ago [Ma]) (Wakabayashi 2011). The Franciscan is on average 7,600 meters thick and is exposed over an area of around 190,000 square kilometers (Norris and Webb 1990). The Salinian block represents a magmatic arc and consists of metamorphic rocks and granitic plutons varying from granodiorite and quartz monzonite to quartz diorite dating from the Late Cretaceous (69–110 Ma) (Barbeau et al. 2005). After Mesozoic deposition shifted to continental shelf origins, a thick series of Cenozoic sedimentary rocks were deposited in the Coast Ranges, the largest of which is the Miocene Monterey formation (approximately 13–15 Ma), a marine unit characterized by organic deposits (Follmi et

al. 2005). During the Pliocene (2.6–5.3 Ma), the sea had withdrawn from most of the Coast Ranges and erosion of the uplands onto valley floors was prominent by the Pleistocene (2.6 Ma) and continues today (Norris and Webb 1990). Coincident with the withdrawal of the sea was the initiation of the Coast Ranges orogeny, creating the topography observed today (Harden 2004).

According to mapping by Dibblee and Minch (2004a, 2004b), the 70 kV power line is underlain by four geologic units: Holocene alluvial gravel, sand, and clay; Holocene stream alluvial sand and gravel (0.01 Ma); Pleistocene older alluvial sediments (0.01–2.6 Ma); and Pleistocene to latest Pliocene Paso Robles formation (2.6–3.6 Ma). These geologic units and their paleontological resource potential are shown in Figure 2 and discussed in more detail below. A summary of the geologic units present at the surface and likely present in the subsurface of the 70 kV power line (see discussion in Section 5.3, Potential Fossil Yield Classification System, below) is presented in Table 1.

4.1.2 Geology and Paleontology

4.1.2.1 ALLUVIAL GRAVEL, SAND, AND CLAY

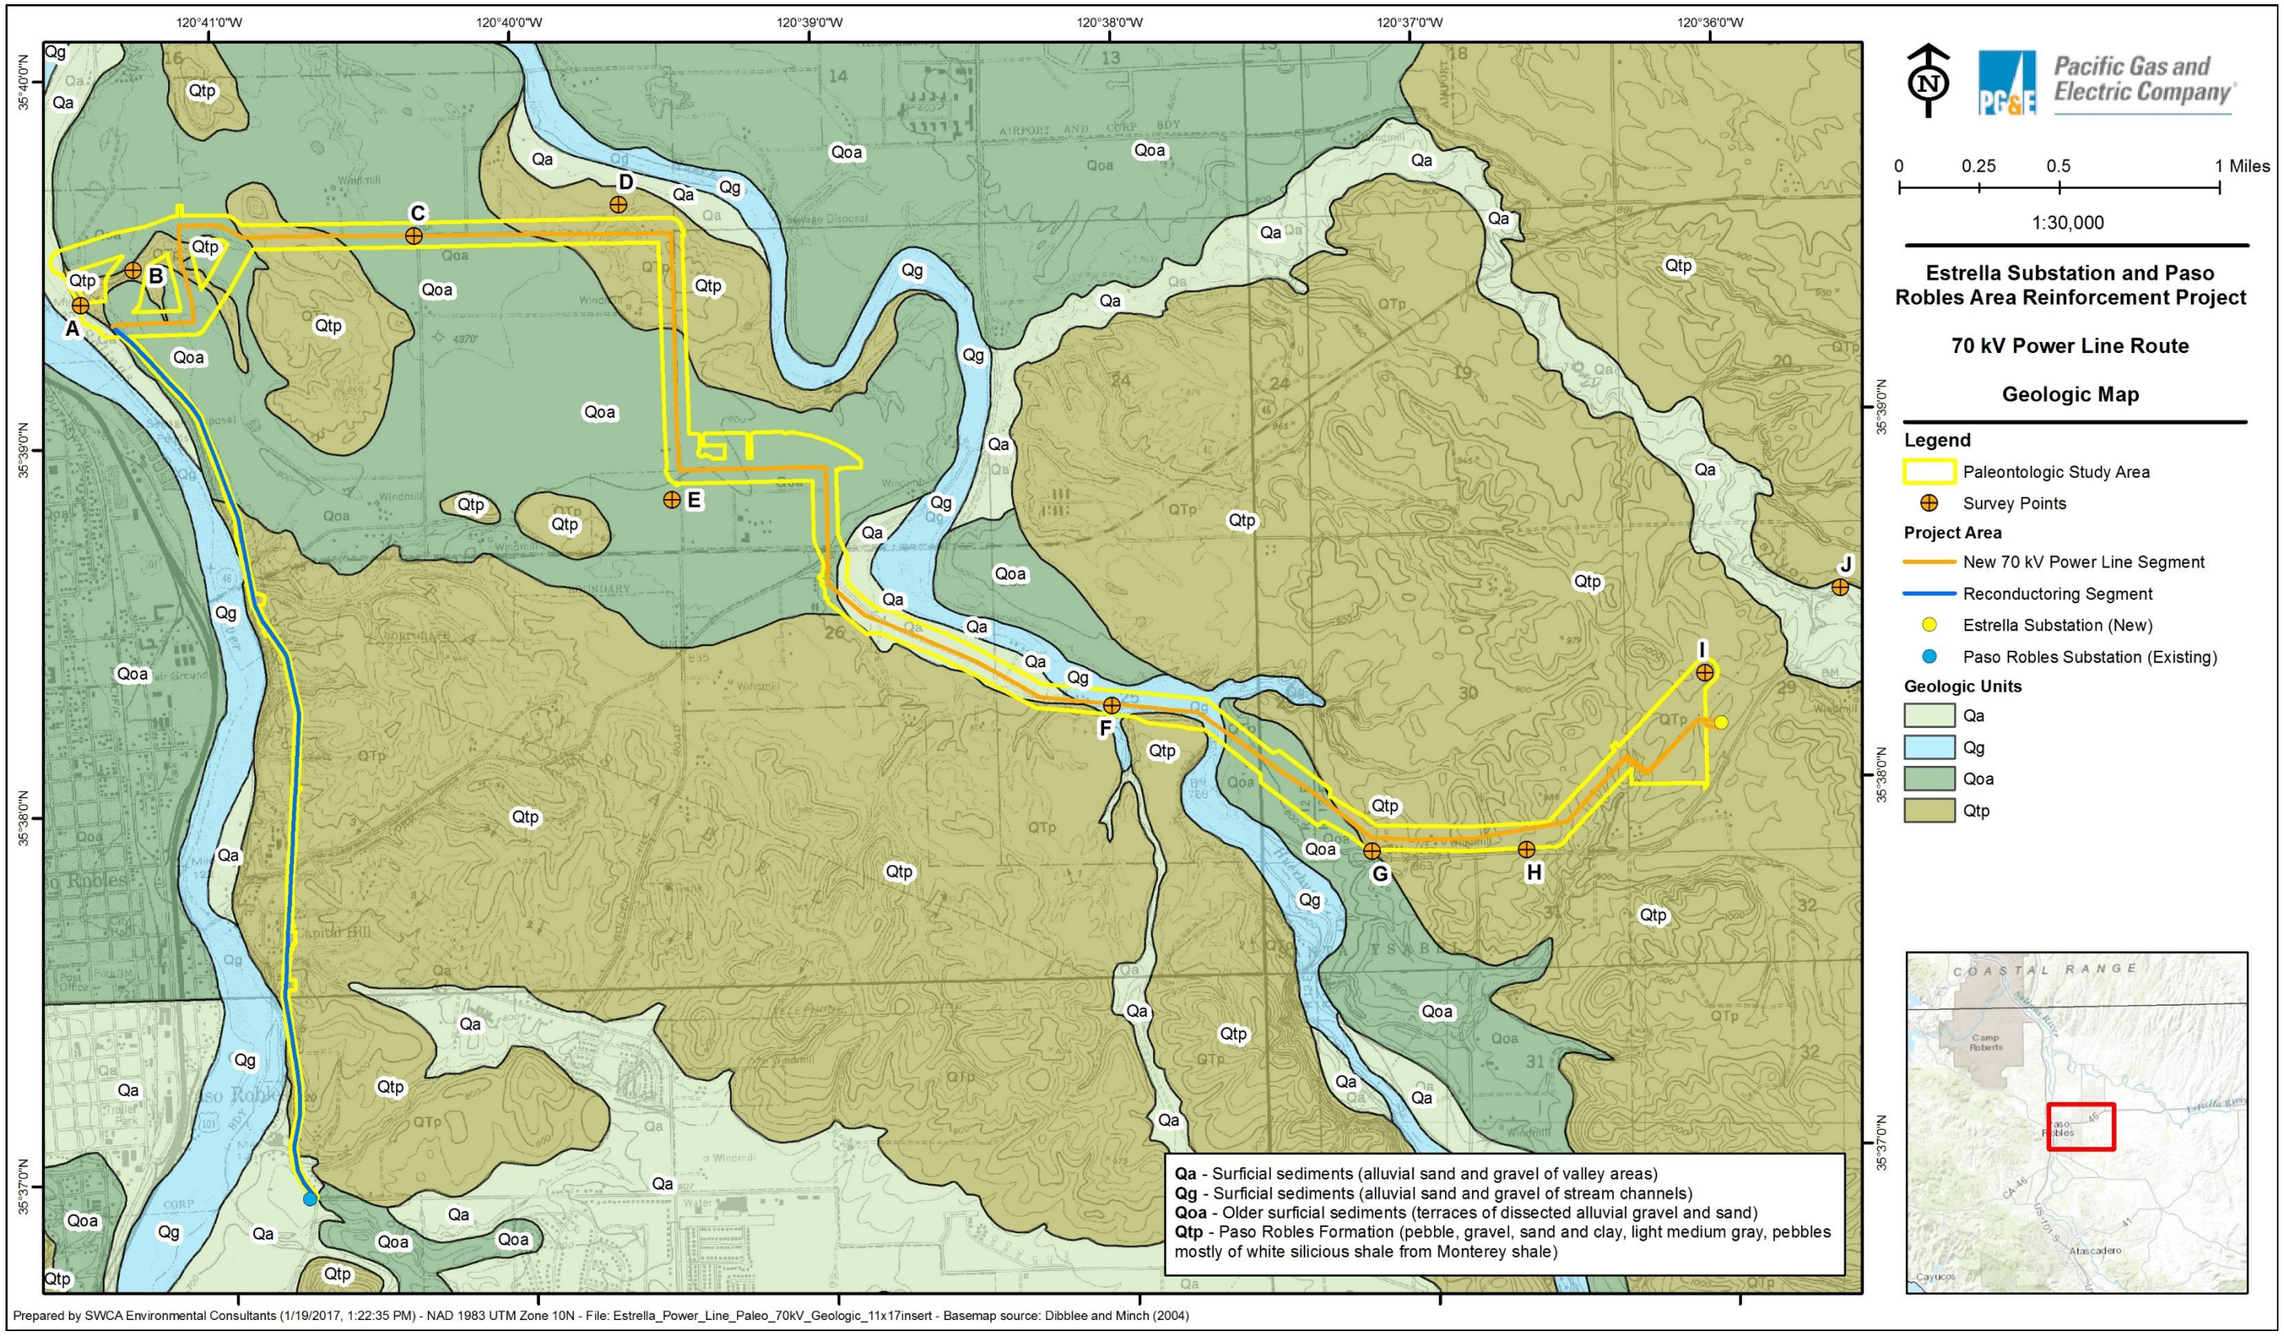
The surficial geology of the central portion of the 70 kV power line, from State Route (SR)-46 south paralleling Union Road and Huerhuero Creek for a distance of approximately 0.9 mile, is composed of Holocene-aged (0.01 Ma–present) alluvial gravel, sand, and clay (mapped as Qa in Figure 3) (Dibblee and Minch 2004a, 2004b). This unit is commonly found alongside stream channels and, due to its young age, is unlikely to preserve fossils.

4.1.2.2 STREAM ALLUVIAL GRAVEL AND SAND

The surficial geology of a very small section of the 70 kV power line, paralleling Union Road and Huerhuero Creek from Kit Fox Lane to the sharp southern turn in Union Road, a distance of less than 0.3 mile, crosses Holocene-aged (0.01 Ma–present) stream alluvial gravel and sand (mapped as Qg in Figure 3) (Dibblee and Minch 2004a, 2004b). This unit is commonly found in stream channels and, due to its young age, is unlikely to preserve fossils.

4.1.2.3 QUATERNARY OLDER ALLUVIAL SEDIMENTS

A large portion of the 70 kV power line crosses Pleistocene-aged older alluvial sediments (mapped as Qoa in Figure 3). These sediments occur primarily in the northern portion of the route, with a small occurrence in the southeastern portion along Huerhuero Creek as well. These older alluvial sediments are Pleistocene (0.01–2.6 Ma) in age and consist of dissected terraces of gravel and sand (Dibblee and Minch 2004a, 2004b). The older alluvial sediments underlie the surficial alluvial sands and gravels (Qa and Qg) in the area, and can be difficult to distinguish from these younger sediments. A number of significant fossil finds, such as fossil horse, bison, camel, ground sloth, and several mammoth specimens, have been reported in the literature from the older alluvial sediments in San Luis Obispo County (Jefferson et al. 1992).



4.1.2.4 PASO ROBLES FORMATION

A large portion of the 70 kV power line is underlain by the Paso Robles formation (mapped as Qtp in Figure 3), with small patches outcropping in the northern portion of the power line alignment near its start at River Road and near the termination of Buena Vista Drive, and with the bulk of the southwestern end of the route underlain by this unit. The Paso Robles formation dates from the Pleistocene to the latest Pliocene (3.6–2.6 Ma) and consists of weakly indurated pebble, gravel, sand, and clay and includes redeposited materials from the Monterey formation (Dibblee and Minch 2004a, 2004b). In some areas, limestone is a minor constituent as well (Woodring and Bramlette 1950). The Paso Robles formation uncomformably overlies the Monterey formation and is exposed almost continuously throughout the upper Salinas Valley (Addicott and Galehouse 1973), including the area around Paso Robles where the 70 kV power line is located. The Paso Robles formation contains facies of both marine and nonmarine origins (Woodring and Bramlette

1950), however detailed studies linking fossil preservation to specific facies are not available. Furthermore, as detailed below, fossils are present in both marine and nonmarine sediments of the Paso Robles. Significant fossils were first found in the Paso Robles formation in 1921 with the discovery of a marine mammal identified as an undescribed seal (pinniped) (Kellogg 1921). Additionally, a large number of marine bivalves including *Ostrea vespertina*, *O. atwoodi*, *Nettastomella rostrata*, and *Hinnites giganteus* (Addicott and Galehouse 1973) as well as smaller numbers of freshwater gastropods and ostracodes (Woodring and Bramlette 1950), have been reported from the Paso Robles formation.

Figure 3. Geologic Map

This page intentionally left blank.

Table 1. Geologic Units within the Area of the 70 kV Power Line

Geologic Unit	Age	Lithology
Alluvial gravel, sand, and clay (Qa)	Holocene (0.1 Ma–present)	Weakly consolidated gravels, sands, and clays
Stream alluvial gravel and sand (Qg)	Holocene (0.1 Ma–present)	Weakly consolidated gravels and sands in streambeds
Quaternary older alluvium (Qoa)	Pleistocene (2.6–0.01 Ma)	Dissected alluvial gravels and sands
Paso Robles formation (Qtp)	Pleistocene–late Pliocene (3.6–2.6 Ma)	Weakly indurated clays-gravels of marine and nonmarine origins

4.2 Records Search Results

A records search request was submitted to the University of California Museum of Paleontology and the Natural History Museum of Los Angeles County for the 70 kV power line and a 1-mile radius. While neither institution has records of fossil localities directly within the 70 kV power line, both museums record vertebrate fossil localities in the vicinity. The nearest fossil locality to the 70 kV power line is less than 1 mile away, in a wash off Dry Canyon between SR-46 and Union Road where the Natural History Museum of Los Angeles County recovered fossil specimens of stickleback fish (*Gasterosteus*), giant tortoise (*Geochelone*), and horse (Equidae) in the Paso Robles formation (Qtp) (McLeod 2016). Two other fossil localities are just over 1 mile away from the 70 kV power line (McLeod 2016). Both sites occur in Quaternary older alluvium (Qoa). One of these sites produced fossil specimens of mammoth (*Mammuthus*), horse (*Equus occidentalis*), and bison (*Bison antiquus*), while the other produced lizard (Lacertilia) and mammoth (*Mammuthus*) (McLeod 2016). Outside the search radius, but within approximately 15 miles of the 70 kV power line, the University of California Museum of Paleontology has four known fossil localities (Finger 2016; see also Appendix A) and the Natural History Museum of Los Angeles County has two additional localities (McLeod 2016; see also Appendix B). All of these localities occur in either Quaternary older alluvium (Qoa), which outcrops just to the southwest of the 70 kV power line (see Figure 3), or the Monterey formation, which is not observed at the surface in the vicinity of the 70 kV power line.

4.3 Field Inspection and Geotechnical Data

The field inspection did not discover any paleontological resources or any paleontologically sensitive geologic formations on the ground surface along the 70 kV power line, due to the nearly complete coverage of the area by agricultural and urban development, as seen in Appendix C. Table 2 summarizes the results of the field survey. Additional survey locations identified along roadcuts and streambeds in the area surrounding the 70 kV power line footprint allowed surveyors to gather basic information about the subsurface geology. Throughout the 70 kV power line, the majority of the land surface is covered by agriculture, grassland, or human development, preventing the observation of the underlying geology. In general, nonsensitive geologic units such as the Holocene alluvium (Qa and Qg) and surface soils range greatly in thickness, from under 1 foot up to 6 feet. Two sites of note were found which allowed interpretation of the subsurface geology. The first of these is in the northwestern terminus of the 70 kV power line and consists of a tall cut bank along River Road (approximately 8 meters; see Appendix C). This bank shows surface soils around 2 feet thick overlying a loosely consolidated sand and gravel deposit with numerous white pebble clasts, consistent with the Paso Robles formation (Qtp). The second site is just to the northeast of the southeastern terminus of the 70 kV power line, where a cut bank in a dry streambed exposes around 30 feet of subsurface geology, showing approximately 5 to 8 feet of soil formation and

younger alluvium overlying and grading into the underlying strata (Appendix C). Comparison of this subsurface strata to the geologic literature indicates the likely presence of Quaternary older alluvium (Qoa) overlying the Paso Robles formation. This site is very near to the 70 kV power line (under 0.5 mile) and mapped as Quaternary older alluvium on the surface (Dibblee and Minch 2004b), and it is reasonable to predict a similar subsurface geology may be found in the south eastern portion of the 70 kV power line.

Geotechnical data derived from borings taken from a vineyard adjacent to the southeastern terminus of the 70 kV power line are consistent with the observations of the subsurface geology from just outside of the power line alignment. Borings identified 8 to 12 inches of topsoil overlying sands, clayey sands, clays, and silts (Appendix L to the PEA) that are consistent with the lithologies of the Paso Robles formation as well as Quaternary older alluvium. A more recent geotechnical study collected data from borings along the proposed 70 kV power line route and determined that sediments consistent with topsoil ranged from depths of approximately 1 foot to 5 feet and were underline by sediments consistent with the Paso Robles formation and Quaternary older alluvium (Appendix M to the PEA).

Survey Dates:	May 16–17, 2016
Survey Data Points:	
Northeastern terminus of 70 kV Power Line, along River Road	
Topography:	Steep hills
Surface Exposure/Development:	Road, houses
Geologic Description:	Approximately 2 feet of soil development overlying thick exposure (over 18 feet) of gravelly sand with numerous pebble beds
Northeastern portion of 70 kV Power Line, farm road 0.3 kilometers east of River Road	
Topography:	Rolling hills, some ravines
Surface Exposure/Development:	Vineyard, soils, trees/shrubs
Geologic Description:	None available
Northeastern portion of 70 kV Power Line, Buena Vista Drive	
Topography:	Mostly flat
Surface Exposure/Development:	Vineyard, soils
Geologic Description:	None available
Northeastern portion of 70 kV Power Line, Buena Vista Drive	
Topography:	Steep hills, ravines
Surface Exposure/Development:	Soils, trees, shrubs

Table 2. Paleontological Field Inspection Results

	Geologic Description:	None available
Central portion of 70 kV Power Line, Golden Hill Road and Dallons Drive		
	Topography:	Mostly flat
	Surface Exposure/Development:	Urban
	Geologic Description:	None available
Central portion of 70 kV Power Line, Union Road		
	Topography:	Mostly flat, dry stream bed to north
	Surface Exposure/Development:	Houses, fields
	Geologic Description:	None available
Central portion of 70 kV Power Line, Union Road and Penman Springs Road		
	Topography:	Mostly flat
	Surface Exposure/Development:	Vineyards, fields
	Geologic Description:	None available
Southeastern portion of 70 kV Power Line, Union Road		
	Topography:	Mostly flat
	Surface Exposure/Development:	Houses, fields
	Geologic Description:	None available
Southeastern portion of 70 kV Power Line, northwest of Union Road		
	Topography:	Mostly flat
	Surface Exposure/Development:	Vineyard
	Geologic Description:	None available
Northeast of southeastern end of 70 kV Power Line, off-site cut bank		
	Topography:	Dry stream bed, approximately 30-foot cut bank
	Surface Exposure/Development:	Vineyard, grasses, soils
	Geologic Description:	Soil grades into reddish older alluvium (6–9 feet), overlying yellow-tan Paso Robles formation (approximately 18 feet exposed)

5 PALEONTOLOGICAL SIGNIFICANCE AND SENSITIVITY

The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist and their value may be greatly diminished or lost entirely in the absence of proper management. Thus, once destroyed, a fossil can never be replaced (Murphey and Daitch 2007). Paleontological resources are objects

of national significance that are worthy of preservation for the inspiration and interpretive opportunities they offer. Fossils are important scientific and educational resources and can be used to:

- study the phylogenetic relationships amongst extinct organisms, as well as their relationships to modern groups;
- elucidate the taphonomic, behavioral, temporal, and diagenetic pathways responsible for fossil preservation, including the biases inherent in the fossil record;
- reconstruct ancient environments, climate change, and paleoecological relationships;
- provide a measure of relative geologic dating which forms the basis for biochronology and biostratigraphy, and which is an independent and corroborating line of evidence for isotopic dating;
- study the geographic distribution of organisms and tectonic movements of land masses and ocean basins through time;
- study patterns and processes of evolution, extinction, and speciation; and,
- identify past and potential future human-caused effects to global environments and climates (Murphey and Daitch 2007).

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are any remains, imprints, or traces of once-living organisms preserved by natural processes in the geologic record. These include mineralized or un-mineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. Paleontological resources include not only fossils, but also organic matter and the physical characteristics of the associated sedimentary matrix. The geologic character of the rock record preserves the ecological, geographic, and evolutionary context of past life represented by fossils. Scientific importance may be attributed to the actual fossil specimen, to fossil context (e.g., location in time and space, intimate association with other evidence of scientific significance), or to fossil preservation.

5.1 Definitions of Significance and Significance Criteria

In paleontology, the term "significance" refers to the scientific value of a particular fossil or fossil site. A number of federal and professional organizations have developed significance criteria for the evaluation of fossil finds; however, there are currently no criteria under CEQA for determining the significance of a fossil. Instead, CEQA requires consideration of whether an activity will "directly or indirectly destroy a unique paleontological resource or site or unique geologic feature" (State CEQA Guidelines, Appendix G, Section V).

In the absence of a codified definition of significance, the SVP has established working definitions that most practicing professional vertebrate paleontologists adhere to closely (1995, 2010). As defined by the SVP, significant nonrenewable paleontological resources are:

> *...Fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project*

> *paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments* (SVP 1995:26).

Furthermore, as defined by the SVP, significant fossiliferous deposits are:

> *A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information* (1995:26).

Strategies for assessing the significance of a fossil are based on the types of scientific information that can be obtained, and must involve an understanding of the known fossil record and associated research questions relating to a given rock unit or fossil assemblage. The value or importance of different fossils varies, depending on age and depositional environment of the rock unit containing the fossils, their rarity, the extent to which they have already been identified and documented, and the ability to recover similar materials under more controlled conditions (e.g., research project). A fossil must also be in a good state of preservation to be considered significant. Unlike sensitivity determinations (see Section 5.2), significance determinations are made on the fossils themselves.

An individual fossil specimen may therefore be considered unique or significant if it is identifiable and well preserved, and it meets one of the following criteria:

- a type specimen (i.e., the individual from which as species or subspecies has been described);
- a member of a rare species;
- a species that is part of a diverse assemblage (i.e., a site where more than one fossil has been discovered) wherein other species are also identifiable, and important information regarding life histories of individuals can be drawn;
- an element different from, or more complete than, those now available for its species; or,
- a complete specimen.

Some examples of the types of research to which significant fossils may be used are as follows:

- taxonomy – fossils that are scientifically judged to be important for representing rare or unknown taxa, such as defining a new species;
- evolution – fossils that are scientifically judged to represent important stages in evolutionary relationships, to fill gaps, or enhance under-represented intervals in the stratigraphic record;
- biostratigraphy – fossils that are scientifically judged to be important for determining or constraining relative geologic age, or for use in regional to interregional stratigraphic correlation;
- paleoecology – fossils that are scientifically judged to be important for reconstructing ancient organism community structure and interpretation of ancient sedimentary environment; or,

- taphonomy – fossils that are scientifically judged to be exceptionally well or unusually or uniquely preserved, or are relatively rare in the stratigraphy.

5.2 Definitions of Sensitivity and Sensitivity Criteria

Paleontological sensitivity is the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Occurrences of paleontological resources are closely related to the geologic units in which they are contained, and the potential for finding scientifically important paleontological resources can be broadly predicted by the presence of the pertinent geologic units at or near the surface. Therefore, geologic mapping can be used as a proxy for assessing the potential for occurrences of important paleontological resources. While in some cases it may be possible to specify a smaller unit of geologic interest than the formation, for example, a certain facies or member within a formation with a higher or lower paleontological sensitivity, this is not possible in the region of the project. Neither of the sensitive units, the Paso Robles Formation or the Quaternary older alluvium, have been mapped or studied to such a degree. Furthermore, the presence of ground cover throughout the area prevents more detailed work. The paleontological sensitivities for this project are therefore discussed on a formation level, the finest unit of distinction available.

5.3 Potential Fossil Yield Classification System

BLM devised a system for evaluating the paleontological resource potential of geologic formations. The Potential Fossil Yield Classification (PFYC) system ranks deposits on a 1 to 5 scale, with 5 having the highest potential, and uses geologic mapping as a predictive tool to identify areas of paleontological sensitivity.

Although the project is not situated on BLM land, the PFYC system is meant to provide baseline guidance for predicting, assessing, and mitigating paleontological resources and can provide a useful tool for identifying the potential for impacts and developing mitigation measures, and is identified as the preferred classification system in the PG&E Paleontological Resources Standards and Procedures (2015). The PFYC system is based on the "relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential" (BLM 2007). This classification is applied to the geologic formation, member, or other distinguishable unit, preferably at the most detailed mappable level. PFYC classification does not reflect rare or isolated occurrences of significant fossils or individual localities, only the relative occurrence on a formation or member-wide basis. Any rare occurrences will require additional assessment and mitigation if they fall within the area of anticipated impacts.

The PFYC System is not intended to be applied to specific paleontological localities or small geographic areas within geologic units. Although significant localities may occasionally occur in a geologic unit, the existence of a few important fossils or localities widely scattered over a large area does not necessarily indicate a higher classification for the unit. The relative abundance of significant localities is intended to serve as the major determinant for the class assignment. The PFYC System is intended to provide baseline guidance for predicting, assessing, and mitigating impacts on paleontological resources.

Guidelines from the BLM describe the PFYC system as follows:

Class 1 – Very Low: Geologic units that are not likely to contain recognizable fossil remains.

- Units that are igneous or metamorphic, excluding reworked volcanic ash units.
- Units that are Precambrian in age or older.

Class 2 – Low: Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant nonvertebrate fossils.

- Vertebrate or significant invertebrate or plant fossils not present or very rare.
- Units that are generally younger than 10,000 years before present.
- Recent aeolian deposits.
- Sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration).

Class 3 – Moderate or Unknown: Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence; or sedimentary units of unknown fossil potential.

- Often marine in origin with sporadic known occurrences of vertebrate fossils.
- Vertebrate fossils and scientifically significant invertebrate or plant fossils known to occur intermittently; predictability known to be low.

  (or)

- Poorly studied and/or poorly documented. Potential yield cannot be assigned without ground reconnaissance.

Class 3a – Moderate: Units are known to contain vertebrate fossils or scientifically significant nonvertebrate fossils, but these occurrences are widely scattered. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for hobby collecting. The potential for a project to be sited on or impact a significant fossil locality is low, but is somewhat higher for common fossils.

Class 3b – Unknown: Units exhibit geologic features and preservational conditions that suggest significant fossils could be present, but little information about the paleontological resources of the unit or the area is known. This may indicate the unit or area is poorly studied, and field surveys may uncover significant finds. The units in this Class may eventually be placed in another Class when sufficient survey and research is performed. The unknown potential of the units in this Class should be carefully considered when developing any mitigation or management actions.

Class 4 – High: Geologic units containing a high occurrence of significant fossils. Vertebrate fossils or scientifically significant invertebrate or plant fossils are known to occur and have been documented, but may vary in occurrence and predictability. Surface disturbing activities may adversely affect paleontological resources in many cases.

Class 4a: Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than 2 acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions. Illegal collecting activities may impact some areas.

Class 4b: These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than 2 contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

Class 5 – Very High: Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils, and that are at risk of human-caused adverse impacts or natural degradation.

Class 5a: Unit is exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than 2 acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions. Unit is frequently the focus of illegal collecting activities.

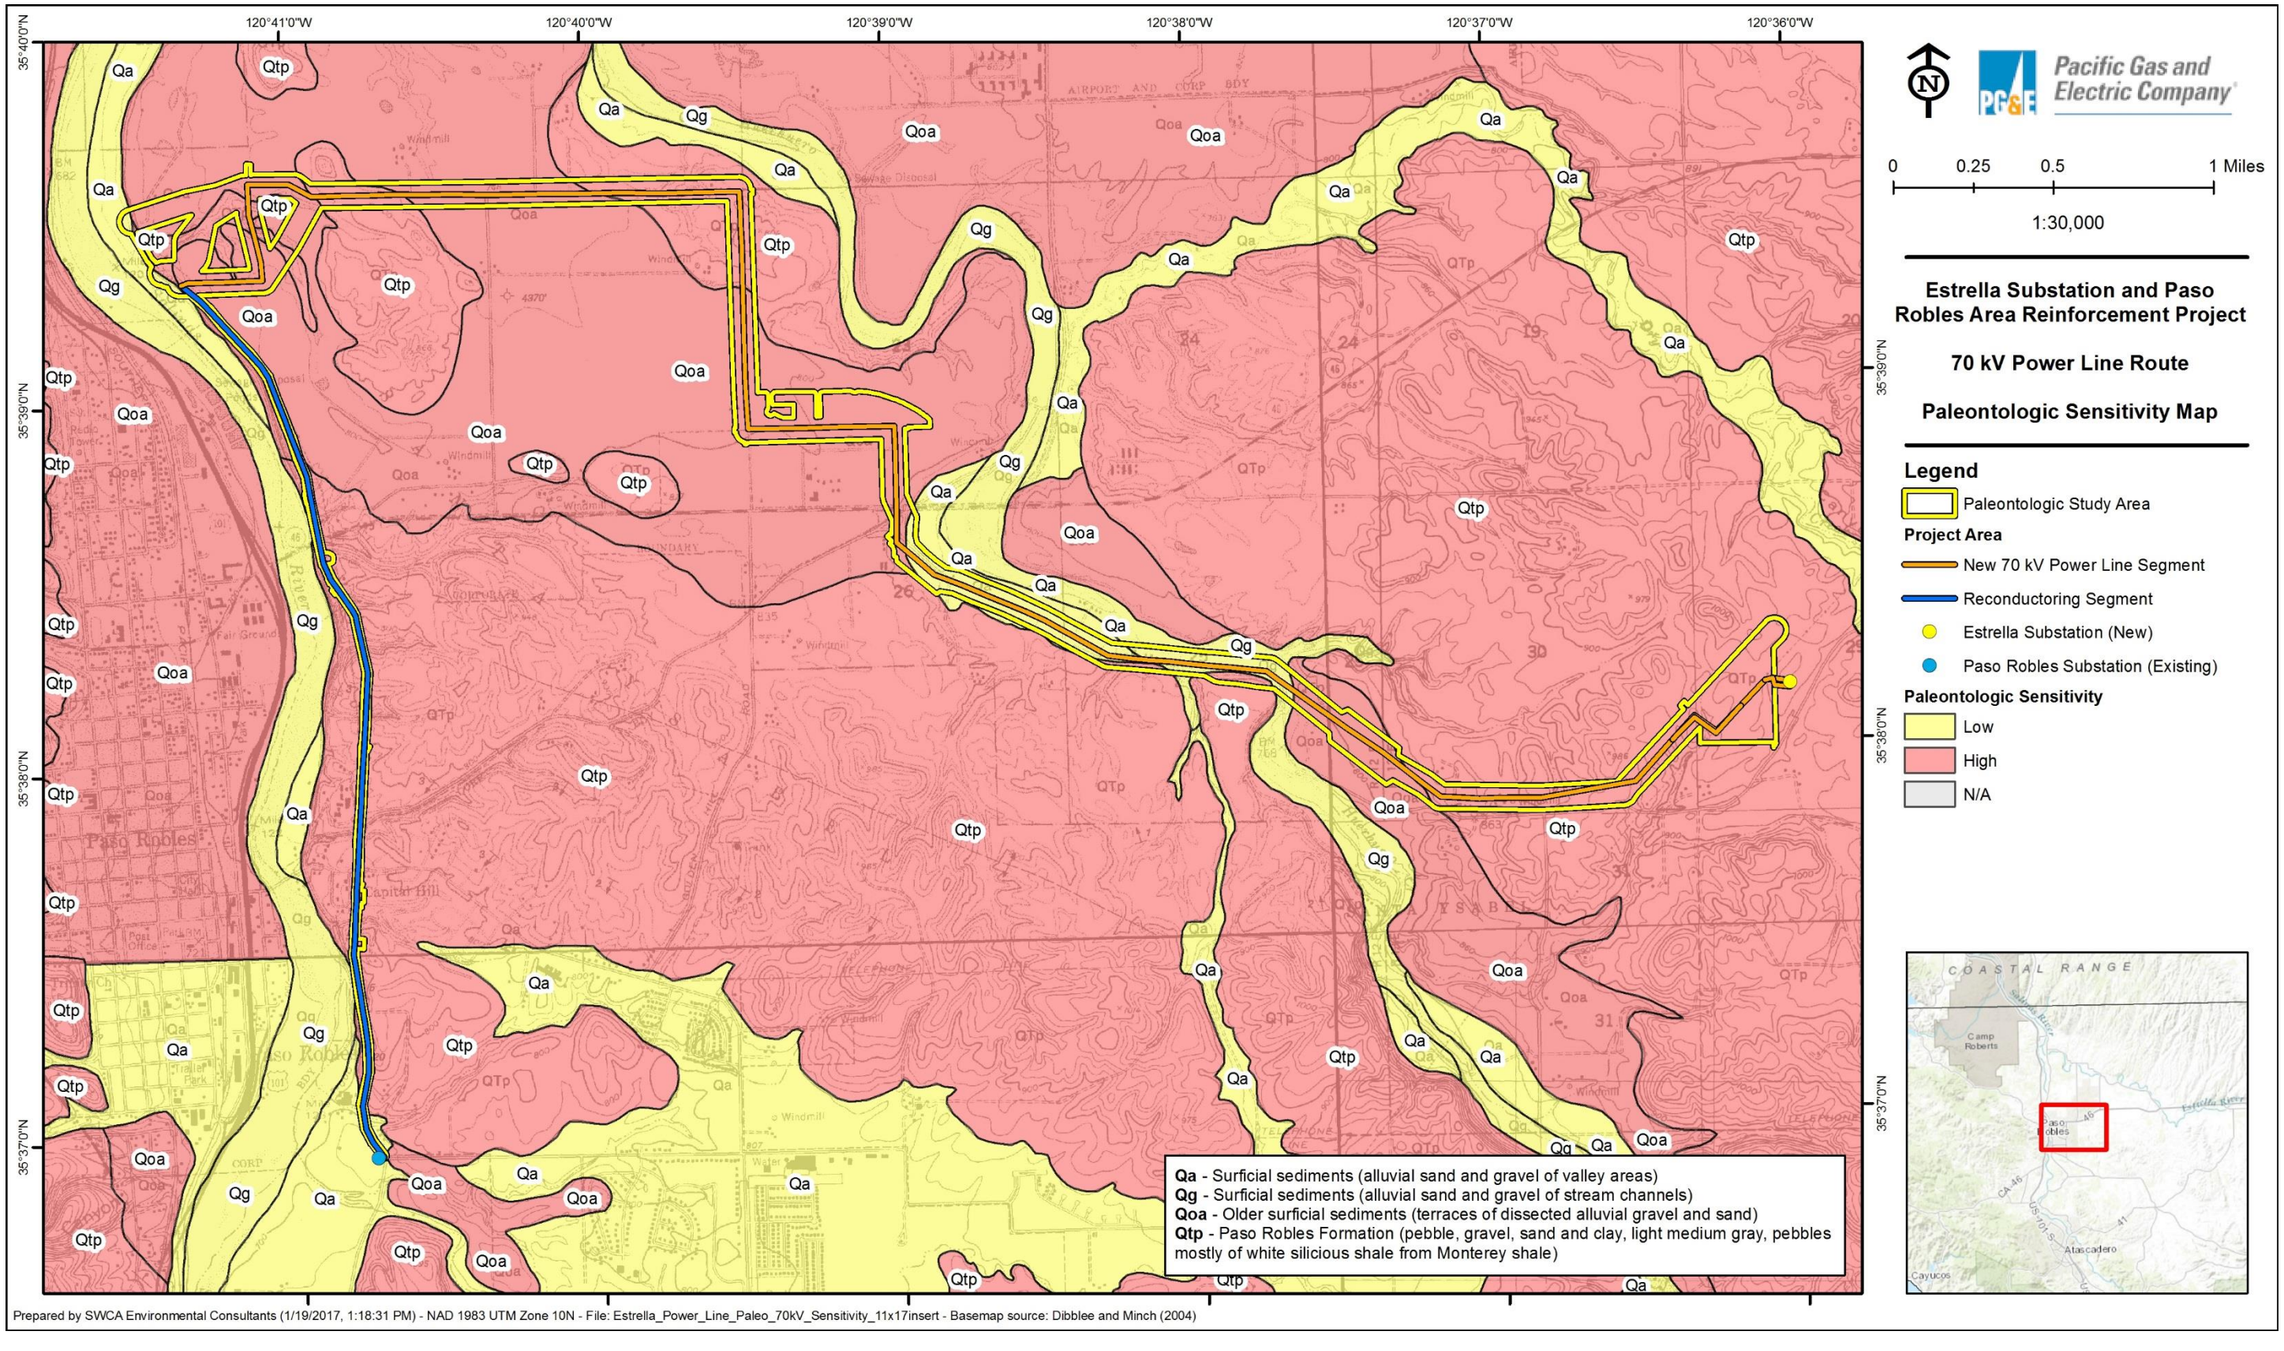
Class 5b: These are areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has very high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.

- Extensive soil or vegetative cover; bedrock exposures are limited or not expected to be impacted.
- Areas of exposed outcrop are smaller than 2 contiguous acres.
- Outcrops form cliffs of sufficient height and slope so that impacts are minimized by topographic conditions.
- Other characteristics are present that lower the vulnerability of both known and unidentified paleontological resources.

5.4 Determination of Sensitivity for Geologic Units within the Vicinity of the 70 kV Power Line

The literature and museum records searches and the field survey enable the geologic units in the vicinity of the 70 kV power line to be assigned PFYCs. These classifications are shown in Table 3. Both the alluvial units (Qa and Qg) are Holocene and therefore too young to preserve fossils, resulting in PFYC rankings of Low (Class 2). Both the older alluvium (Qoa) and the Paso Robles formation are known to be fossiliferous and have produced scientifically significant localities in the past. This is indicated by numerous papers published in the scientific literature on fossils from those units (e.g., Addicott and Galehouse 1973; Jefferson 1992; Kellogg 1921; Woodring and Bramlette 1950) as well as the records search results from both the University of California Museum of Paleontology (Finger 2015) and the Natural History Museum of Los Angeles County (McLeod 2015). Therefore, based on the PFYC system developed by BLM (2007), both these units should be classified as Class 4b, high with ground cover (Figure 4).

Table 3. Paleontological Sensitivity of Geologic Units in the Vicinity of the 70 kV Power Line



Geologic Unit	Age	Potential Fossil Yield Classification
Alluvial gravel, sand, and clay (Qa)	Holocene (0.1 Ma–present)	Low – Class 2
Stream alluvial gravel and sand (Qg)	Holocene (0.1 Ma–present)	Low – Class 2
Quaternary older alluvium (Qoa)	Pleistocene (2.6–0.01 Ma)	High – Class 4b
Paso Robles formation (Qtp)	Pleistocene–late Pliocene (3.6–2.6 Ma)	High – Class 4b

Table 4. Approximate Locations of Geologic/Sensitive Units Along the 70 kV Power Line

Geologic Unit	Location in Project Area
Alluvial gravel, sand, and clay (Qa)	Exposures along the central portion of the 70 kV power line, from SR-46 south paralleling Union Road and Huerhuero Creek.
Stream alluvial gravel and sand (Qg)	Exposure in the stream bed paralleling Union Road and Huerhuero Creek from Kit Fox Lane to the sharp southern turn in Union Road.
Quaternary older alluvium (Qoa)	Sediments occur primarily in the northern portion of the 70 kV power line, with a small occurrence in the southeastern portion along Huerhuero Creek .
Paso Robles formation (Qtp)	Outcrops in the northern portion of the 70 kV power line near its start at River Road and near the termination of Buena Vista Drive; the majority of the southwestern end of the 70 kV power line.

ALYSSA BELL, PH.D., PRINCIPAL INVESTIGATOR

As a paleontological principal investigator, Dr. Bell has supervised field work, authored project reports, and provided scientific and compliance direction and quality control for SWCA's paleontological projects throughout California. Aside from her work with SWCA, Dr. Bell is a postdoctoral research assistant at the Dinosaur Institute of the Natural History Museum of Los Angeles County. There she is involved in pursuing her own research into fossil birds as well as working with the Institute's field projects and museum-wide education and outreach initiatives. Dr. Bell has accumulated a wealth of field experience, working with crews from a variety of institutions on field sites in Arizona, California, Montana, New Mexico, South Dakota, and Utah, as well as leading her own expeditions in Montana. She has published nine peer-reviewed articles or book chapters and given numerous presentations at scientific conferences on both her paleontological and microbiological research.

EDUCATION

Ph.D., Vertebrate Paleontology; University of Southern California; 2013

M.S., Environmental Microbiology; University of Tennessee; 2007

B.A. with honors, Ecology and Systematics; William JewellCollege&Homerton College, Cambridge University; 2004

SELECTED PROJECT EXPERIENCE (∗ denotes project experience prior to SWCA)

SCE CWA 948 CRNR Kernville Service Center Project; Kern County, California; Southern California Edison Company. *Role: Principal Investigator. Authored the paleontological resources analysis for the Kernville Service Center development.*

Shafter Wasco Irrigation District Natural and Cultural Resource Evaluations and Air Quality; Kern County, California; Provost & Pritchard Consulting Group. *Role: Principal Investigator. Reviewed and edited the paleontological evaluation report.*

Valentine Solar Project Environmental Impact Report; Kern County, California; Quincy Engineering. SWCA is providing comprehensive biological, cultural, and paleontological surveys to support the preparation of an EIR and other permitting requirements for a proposed 2,000 acre solar project located in the Antelope Valley portion of Kern County, California. *Role: Principal Investigator. Reviewed and edited the paleontological evaluation report.*

Valentine Solar EIR 115MW Supplemental Reports; Kern County, California; Provost & Pritchard Consulting Group. *Role: Principal Investigator.*

SCE CWA 1020 Circle City Substation and Mira Loma-Jefferson Subtransmission Line Project; Riverside and San Bernardino Counties, California; Southern California Edison Company. *Role: Principal Investigator.*

SCE CWA 629 Fogarty Substation Getaway Install Archaeological and Paleontological Monitoring, Riverside County; Riverside County, California; Southern California Edison Company. *Role: Principal Investigator.*

El Camino Real Bridge Replacement Environmental Services; San Luis Obispo County, California; Quincy Engineering. SWCA is providing environmental services, including preparation of all CEQA/NEPA documentation, technical studies, and permitting, for the replacement of the El Camino Real bridge over Santa Margarita Creek in Atascadero. *Role: Principal Investigator. Reviewed and edited the paleontological evaluation report.*

Shasta Project Baseline Studies-Paleontology; White Pine County, Nevada; NOV Wellbore Technologies. *Role: Principal Investigator.*

Blythe Solar Power Project, Units 1 & 2; Blythe, Riverside County, California: AECOM Technical Services and Dudek. SWCA is conducting paleontological monitoring of preconstruction activities for a solar photo-voltaic cell power-generating facility outside the City of Blythe. *Role: Project paleontologist. Oversight and management of paleontological monitors and development of final monitoring report.*

City of Colton Industrial Project Environmental Impact Report; San Bernardino County, California; PlaceWorks. A 6-acre industrial project at the southwest corner of Agua Mansa Road and Rancho Avenue in the City of Colton. SWCA provided historic, cultural resources, and paleontological resources study for the project site. *Role: Principal Investigator.*

City of Hope Specific Plan and Environmental Impact Report; Duarte, Los Angeles County, California; PlaceWorks. *Role: Principal Investigator.*

SCE CWA 174 ACTR/Natural Sub 29 Bores; Los Angeles County, California; Southern California Edison Company. *Role: Principal Investigator.*

Natural and Cultural Support for the Gordon Mull Subdivision Environmental Impact Report; Glendora, Los Angeles County, California; Terry A. Hayes Associates, LLC. SWCA was selected to prepare an EIR for in Support of Environmental Impact Report for the Gordon Mull Subdivision, City of Glendora, Los Angeles County, California. The project is proposing to redevelop a 71-acre, 19-lot located in the San Gabriel Foothills. Under the current contract, SWCA biology and cultural resources staff are collecting data to prepare respective resources and mitigation sections for an EIR overseen by TAHA staff. *Role: Principal Investigator.*

ICHA Area 10 (PA 10-2 & 10-4) Archeological and Paleontological Monitoring; Irvine, Orange County, California: California Pacific Homes. SWCA is conducting archaeological and paleontological monitoring of preconstruction activities in support of a housing development project at the University of California, Irvine. *Role: Principal Investigator. Management of the curatorial process for the fossils collected during monitoring and author of final reporting.*

Lake Elsinore Lakeshore Town Center Permitting; Riverside County, California; Mebo Properties Development LLC. *Role: Principal Investigator.*

Mojave Solar Project Paleontological Reporting; San Bernardino County, California; CH2M Hill. SWCA is providing environmental services, including paleontological monitoring of construction activities in support of a solar field development project. *Role: Principal Investigator. Reviewed and edited the paleontological resources report.*

NAVFAC SW TO3 Barstow ICRMP Update; Barstow, San Bernardino County, California; NAVFAC SW. SWCA completed 7 ELINs related to update of the Barstow ICRMP. These services include historic resources survey and evaluation, archaeology, and reporting. *Role: Principal Investigator.*

Coachella Flats Wind Energy Repower Environmental Surveys; Palm Springs, Riverside County, California; New Dimension Energy Company. *Role: Principal Investigator.*

OTO Hotels Santa Monica Archaeological and Paleontological Services; Santa Monica, Los Angeles County, California; OTO Development, LLC. SWCA provided paleontological monitoring and mitigation services during construction excavations and grading. Services included implementation of a paleontological mitigation monitoring program and reporting. *Role: Principal Investigator.*

San Pedro Plaza Park - Phase III Archaeological Monitor; Los Angeles, Los Angeles County, California; City of Los Angeles. *Role: Principal Investigator.*

Sixth & Bixel Paleontological Monitoring Services Project; Los Angeles, Los Angeles County, California; Holland Partners. SWCA is conducting paleontological monitoring of construction activities in support of a development project encompassing two parcels in downtown Los Angeles. Monitors identified and recovered numerous significant vertebrate fossils. *Role: Principal Investigator. Supervised the excavation of fossilized whale remains discovered onsite, managed curatorial process for all fossils collected during monitoring, author of final reporting.*

Suncrest Project Environmental Planning and Compliance Services; Contra Costa County, California; NextEra Energy Transmission LLC. *Role: Principal Investigator.*

Tesla-Newark 230kV Path; Newark, County, California; Confidential. CONFIDENTIAL *Role: Principal Investigator.*

PA 10-3 Archaeological Monitoring; Irvine, Orange County, California; California Pacific Homes. *Role: Principal Investigator.*

Washington National Archaeological and Paleontological Monitoring (Access Culver City); Culver City, Los Angeles County, California; GDCV Culver City, LLC. SWCA implemented an archaeological and paleontological mitigation monitoring program during project grading, as well as archaeological feature and artifact identification, recordation, and recovery; laboratory preparation, identification, analysis, and curation preparation of archaeological materials; and reporting. *Role: Principal Investigator.*

Web-based Countywide Plan and Environmental Impact Report; San Bernardino County, California; PlaceWorks. *Role: Principal Investigator.*
