APPENDIX M TRANSPORTATION AND TRAFFIC

INTRODUCTION

This Appendix provides data on existing traffic volumes within the Proposed Project area and traffic volumes on area roads and highways with the addition of the Proposed Project traffic.

TRAFFIC COUNTS

Local Roads

Traffic volumes along the Proposed Project route were obtained by a variety of methods including existing data from government agencies and counts taken specifically for this study. Table M-1 shows the locations of counts taken along the route with the type of count and the source of the data.

Caltrans Facilities

Annual Average Daily Traffic

Table M-2 provides average annual daily traffic (AADT) volumes for Caltrans facilities near the Proposed Project. Annual average daily traffic is the total traffic volume for the year divided by 365 days. The traffic count year is from October 1st through September 30th. Very few locations in California are actually counted continuously. Electronic counting instruments moved from location to location throughout the State in a program of continuous traffic count sampling generally perform traffic counting. The resulting counts are adjusted to an estimate of annual average daily traffic by compensating for seasonal influence, weekly variation and other variables, which may be present. Annual ADT is necessary for presenting a statewide picture of traffic flow, evaluating traffic trends, computing accident rates, planning and designing highways and other purposes. Back AADT refers to west or south of the location. Ahead ADT refers to east or north of the location

Peak Hour Traffic

Table M-3 provides peak hour traffic volumes for Caltrans facilities. Traffic typically peaks twice a day during the morning and evening commute. Traditionally, the peak volume on the road system is found during what is called the AM Peak Period and the PM Peak Period. These periods are usually between the hours of 7:00-9:00 AM and 4:00-7:00 PM respectively.

Turning Movements

Turning movement counts were taken during each of the Peak Periods for the intersections listed in Table M-4. The peak hour is the sum of the volumes during the four consecutive 15-minute blocks that results in the highest volume for one hour during either the AM Peak Period or the PM Peak Period.

APPENDIX M TRANSPORTATION AND TRAFFIC

LEVEL OF SERVICE (LOS)

CEQA guidelines for traffic impact analyses are being revised to reflect the use of vehicle miles traveled (VMT) rather than Level of Service (LOS) generated by the project consistent with SB 743. The Office of Planning and Research developed preliminary discussion draft guidelines (OPR 2014); however no final guidance is currently available.

The Proposed Project will generate additional trips during construction and will involve construction activities within roadways that could create a traffic hazard; therefore, LOS provides a more accurate account of the traffic impacts for the Proposed Project than VMT because the long-term generation of VMT from the Proposed Project is negligible. The Proposed Project does not directly or indirectly create new permanent sources of traffic in the region. Additionally, the General Plans and policies for the City of San Diego, City of Poway and SANDAG currently use LOS to assess traffic impacts. For these reasons, the traffic impacts of this project will be analyzed in terms of LOS rather than VMT.

Caltrans LOS

LOS calculations for freeway segments are based on the latest Highway Capacity Manual operation analysis. Table M-5 contains traffic volumes and LOS for Caltrans facilities under baseline conditions and with construction traffic.

Local Roads LOS

The LOS for local roads is calculated based on the City of San Diego Traffic Impact Study Manual.

Construction Traffic to Work Areas

Table M-6 provides traffic volumes and LOS for local roads that would be used to access Proposed Project work areas under baseline conditions and with construction traffic.

Construction Traffic to Staging Yards

Table M-7 provides the traffic volume data and LOS for the collector and minor arterial roads that would provide access from each staging yard to the Proposed Project alignment.

Alternative 3 Underground Segment Construction Traffic

Table M-8 provides the traffic volume data and LOS for the collector and minor arterial roads that would provide access to the Alternative 3 underground alignment.

Alternative 4 Underground 69 kV Line Construction Traffic

Table M-6 provides traffic volume data and LOS for the collector and minor arterial roads that would provide access to the Alternative 4 underground alignment.

**APPENDIX M
TRANSPORTATION AND TRAFFIC**

Alternative 5 Underground Alignment Construction Traffic

Table M-9 provides traffic volume data and LOS for the collector and minor arterial roads that would provide access to the Alternative 5 underground alignment.

PEAK HOUR VOLUME DATA

Peak hour volume data consists of hourly volume relationships and data location. The hourly volumes are expressed as a percentage of the Annual Average Daily Traffic (AADT). The percentages are shown for both the AM and the PM peak periods.

The principle data described here are the K factor, the D factor and their product (KD). The K factor is the percentage of AADT during the peak hour for both directions of travel. The D factor is the percentage of the peak hour travel in the peak direction. KD multiplied with the AADT gives the one way peak period directional flow rate or the design hourly volume (DHV). The design hourly volume is used for either Operational Analysis or Design Analysis. Refer to the 20F€ Highway Capacity Manual for more details.

Following is a glossary of terms used in this listing of peak hour volume data:

Dir	Indicates direction of travel for peak volume
AADT	Annual Average Daily Traffic in vehicles per day (vpd).
AM Peak	Represents the morning peak period for traffic analysis
CS	Control Station Number, Caltrans identification number for monitoring site.
CO	County abbreviation used by Caltrans
D	D factor. The percentage of traffic in the peak direction during the peak hour. Values in this book are derived by dividing the measured PHV by the sum of both directions of travel during the peak hour.
DAY	Day of week for the peak volume.
DDHV	The directional design hour volume, in vehicles per hour (vph) $DDHV = AADT \times K \times D$. See equation (H-1) on page H-11 of the 20F0 Highway Capacity Manual.
DI	Caltrans has twelve transportation districts statewide. This abbreviation identifies the district in which the count station is located.
HR	The ending time for the peak hour volume listed. The volume observed from 1 to 2 would be recorded as 2.

K	The percentage of the AADT in both directions during the peak hour. Values in this table are derived by dividing the measured 2-way PHV by the AADT.
KD	The product of K and D. The percentage of AADT in the peak direction during the peak hour. Values in this table are derived by dividing the measured 1-way PHV by the AADT.
LEG	For traffic counting purposes, a highway intersection or interchange is assigned two legs according to increasing postmiles (route direction) and with a postmile reference at the center of the intersection or interchange. The volume of traffic on each leg is denoted by an A, B or O. A = ahead leg, B = back leg, and O – traffic volume being same for both back and ahead legs.
MNTH	The month that the peak volume occurred.
PHV	Peak Hour Volume in the peak direction. A one way volume in vehicles per hour (vph) as used here. The PHV is analogous to the DDHV as used for design purposes.
PM	The Post Mile is the mileage measured from the county line, or from the beginning of a route. Each postmile along a route in a county is a unique location on the state highway system.
PM Peak	Represents the afternoon peak period for traffic analysis.
PRE	The postmile may have a prefix like R, T, L, M, etc. When a length of highway is changed due to construction or realignment, new postmile values are assigned. To distinguish the new values from the old, an alpha code is prefixed to the new postmile.
RTE	The state highway route number
YR	The year when the count was made. Traffic counting is on a 3-year cycle.

PREFACE

Traffic Trend

A comparison of the 2013 over 2012 annual traffic volume data shows that state highway travel increased in 2013. This year's increase in vehicle miles of travel on California highways compares with prior years as follows:

*2013 over 2012.....	+ 1.86%
*2012 over 2011.....	+ 0.24%
*2011 over 2010.....	- 1.1%
2010 over 2009.....	- 0.2%
2009 over 2008.....	- 0.6%

Traffic Profile

This booklet lists 2013 traffic volumes for all count locations on the California state highway system. Peak hours, peak month ADTs and annual ADTs are shown at each count location. Significant volume changes (breakpoints) in the traffic profile along each route are counted and identified by name and milepost value. In addition to the profile breakpoints, the booklet lists county lines and landmarks to aid in orientation.

The numbers shown in this booklet apply to the highway immediately back and ahead of the locations. Therefore, between any two successive breakpoints along the route it may be assumed that traffic volumes will vary from one breakpoint to the next at a reasonably uniform rate of increase or decrease. Where only a single set of figures appears between two breakpoints, a constant volume of traffic may be assumed for the intervening section of highway.

All traffic volume figures listed in this booklet include traffic in both directions unless otherwise indicated.

Route Number

All California state highways are listed in this booklet in order of Legislative Route number.

Milepost

Each profile breakpoint is identified by the milepost value corresponding to that point on the highway. The milepost values increase from the beginning of a route within a county to the next county line. The milepost values start over again at each county line. Milepost values usually increase from South to North or West to East depending upon the general direction the route follows within the state.

The milepost at a given location will remain the same year after year. When a section of road is relocated, new mileposts (usually noted by an alphabetical prefix such as "R" or "M") are established for it.

* Based on the Traffic Data Branch's Estimated Monthly Vehicle Miles of Travel Report.

Annual Average Daily Traffic (Annual ADT)

Annual average daily traffic is the total traffic volume for the year divided by 365* days. The traffic count year is from October 1st through September 30th. Very few locations in California are actually counted continuously. Traffic counting is generally performed by electronic counting instruments moved from location to location throughout the State in a program of continuous traffic count sampling. The resulting counts are adjusted to an estimate of annual average daily traffic by compensating for seasonal influence, weekly variation and other variables which may be present. Annual ADT is necessary for presenting a statewide picture of traffic flow, evaluating traffic trends, computing accident rates, planning and designing highways and other purposes.

Peak Month ADT

The peak month ADT is the average daily traffic for the month of heaviest traffic flow. This data is obtained because on many routes, high traffic volumes which occur during a certain season of the year are more representative of traffic conditions than the annual ADT.

Peak Hour

This publication includes an estimate of the “peak hour” traffic at all points on the state highway system. This value is useful to traffic engineers in estimating the amount of congestion experienced, and shows how near to capacity the highway is operating. Unless otherwise indicated, peak hour values indicate the volume in both directions.

A few hours each year are higher than the “peak hour,” but not many. In urban and suburban areas, the peak hour normally occurs every weekday, during what is considered “rush hour” traffic. On roads with large seasonal fluctuations in traffic, the peak hour is the hour near the maximum for the year but excluding a few (30 to 50 hours) that are exceedingly high and are not typical of the frequency of the high hours occurring during the season.

Peak Hour Traffic Directional Split

The Peak Hour Traffic Directional Split listing is given after the last route. The listing is by district, route, control station, milepost, leg, one-way peak hour volume (1-way PHV) and shows the 2-way peak hour percent of AADT (K Factor), the percent traffic in the peak direction (D Factor), the 1-way peak hour percent of AADT (KD Factor), the ending hour, day, and month for the AM and the PM peak hours. The data given is for the latest year available at each of the control stations counted in the last three years. A glossary is also included.

* The routes listed on page iv were closed during the year for one month or more. The locations are listed in three groups: A. Regular Winter Closure, B. Closure Due to Flooding, Mudslide or Washout, and C. Closure Due to Construction. The ADT shown reflects travel while the route is open.

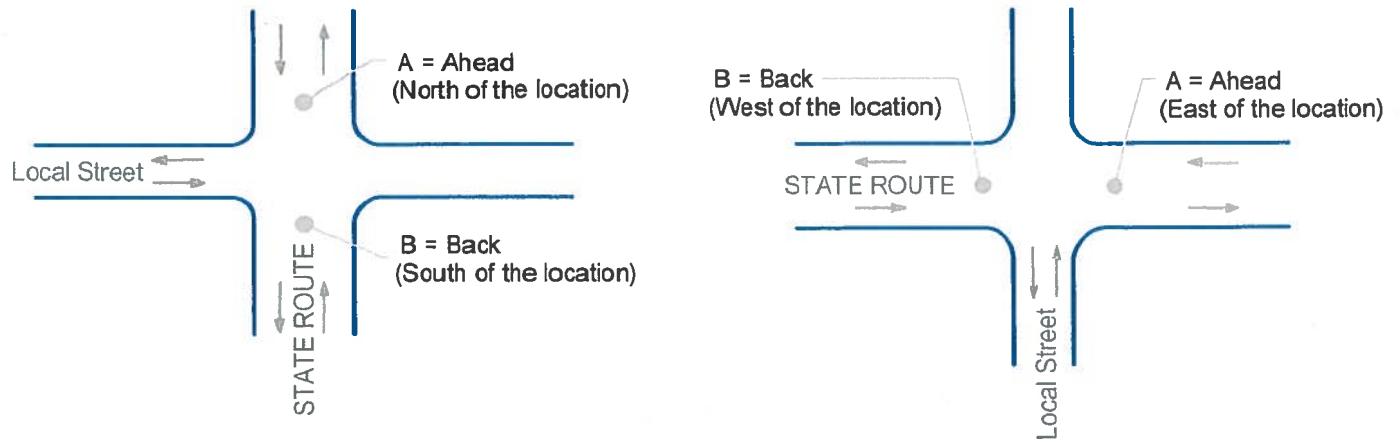

Closures List

A. Regular Winter Closure

Route	Location/Miles Closed
2	.1 mile East of Kratka Ridge Skilift to Vincent Gap, 11.7 miles.
4	Ebbetts Pass, Mt. Reba Road to Jct. Route 89, 29 miles.
89	Monitor Pass, Jct. Route 395 to Jct. Route 4, 17.5 miles.
108	Sonora Pass, 6 miles East of Strawberry to 7 miles West of Jct. Route 395, 35 miles.
120	Tioga Pass, Crane Flat to 5 miles West of Jct. Route 395, 55 miles.
120	Mono-Milss Road, 2 miles East of Jct. Route 395 to 6 miles West of Jct. Route 6, 37.6 miles.
158	June Lake Loop, Powerhouse to North Jct. Route 395, 8.6 miles.
168	Bishop Creek Road, Aspendell to Lake Sabrina, 1.25 miles.
172	Mill Creek, Mill Creek P.O. to East Jct. Route 36, 3.2 miles.
173	Deer Park Road to Hesperia Road, 1.6 miles.
180	Kings Canyon National Park, Hume Lake Road to Deer Cove Creek, 19.8 miles.
203	Mammoth Lakes Road, Beginning at Mno/Mad. County line to 1 mile East, 1 mile.

Explanation of Traffic Counts

Explanatory Diagram of Traffic Counts

Generally, in California West to East routes are even numbered, while South to North routes are odd numbered. In addition, the postmile values increase from South to North or West to East depending upon the general direction the highway follows within the state, except the following 5 backward routes, Route 71 (North to South), Route 224 (East to West), Route 282 (East to West), Route 580 (East to West), and Route 780 (East to West).

PEAK HOUR VOLUME DATA

Peak hour volume data consists of hourly volume relationships and data location. The hourly volumes are expressed as a percentage of the Annual Average Daily Traffic (AADT). The percentages are shown for both the AM and the PM peak periods.

The principle data described here are the K factor, the D factor and their product (KD). The K factor is the percentage of AADT during the peak hour for both directions of travel. The D factor is the percentage of the peak hour travel in the peak direction. KD multiplied with the AADT gives the one way peak period directional flow rate or the design hourly volume (DHV). The design hourly volume is used for either Operational Analysis or Design Analysis. Refer to the 2010 Highway Capacity Manual for more details.

Following is a glossary of terms used in this listing of peak hour volume data:

Dir	Indicates direction of travel for peak volume
AADT	Annual Average Daily Traffic in vehicles per day (vpd).
AM Peak	Represents the morning peak period for traffic analysis
CS	Control Station Number, Caltrans identification number for monitoring site.
CO	County abbreviation used by Caltrans
D	D factor. The percentage of traffic in the peak direction during the peak hour. Values in this book are derived by dividing the measured PHV by the sum of both directions of travel during the peak hour.
DAY	Day of week for the peak volume.
DDHV	The directional design hour volume, in vehicles per hour (vph) $DDHV = AADT \times K \times D$. See equation (3-1) on page 3-11 of the 2010 Highway Capacity Manual.
DI	Caltrans has twelve transportation districts statewide. This abbreviation identifies the district in which the count station is located.
HR	The ending time for the peak hour volume listed. The volume observed from 1 to 2 would be recorded as 2.

K	The percentage of the AADT in both directions during the peak hour. Values in this table are derived by dividing the measured 2-way PHV by the AADT.
KD	The product of K and D. The percentage of AADT in the peak direction during the peak hour. Values in this table are derived by dividing the measured 1-way PHV by the AADT.
LEG	For traffic counting purposes, a highway intersection or interchange is assigned two legs according to increasing postmiles (route direction) and with a postmile reference at the center of the intersection or interchange. The volume of traffic on each leg is denoted by an A, B or O. A = ahead leg, B = back leg, and O – traffic volume being same for both back and ahead legs.
MNTH	The month that the peak volume occurred.
PHV	Peak Hour Volume in the peak direction. A one way volume in vehicles per hour (vph) as used here. The PHV is analogous to the DDHV as used for design purposes.
PM	The Post Mile is the mileage measured from the county line, or from the beginning of a route. Each postmile along a route in a county is a unique location on the state highway system.
PM Peak	Represents the afternoon peak period for traffic analysis.
PRE	The postmile may have a prefix like R, T, L, M, etc. When a length of highway is changed due to construction or realignment, new postmile values are assigned. To distinguish the new values from the old, an alpha code is prefixed to the new postmile.
RTE	The state highway route number
YR	The year when the count was made. Traffic counting is on a 3-year cycle.
