

Nest Survey Report

Date: 08/4/2017

Biologist(s): Jimmy McMorran, Brynne Mulrooney

Survey Area/Location/Structures:

Segment 3 – Sections 7 (528+00 - 544+00), 13 and 14 (618+00 - 654+00)

Segment 5 – Sections 2 (30+00 -35+00) and 10 (156+00 - 174+00)

Segment 2 – GS 18

Proposed Construction within Survey Area:

Proposed construction activities include pot-holing and excavation and trenching for installation of new underground 230kV line and vaults.

Is V	Vegetation	Clearing	Required?	Yes:	No:	\boxtimes	ı
------	-------------------	----------	-----------	------	-----	-------------	---

Was Complete Survey Coverage Achieved? Yes: ⊠ No: □

Details of modifications to the survey area if complete coverage was not achieved: N/A

Survey Conditions:

Start	End

Habitat(s) and Vegetation Description within Survey Area:

- Ornamental
- o Disturbed
- o Eucalyptus Woodland
- o Riparian
- o Coastal Sage Scrub
- Southern Mixed Chaparral

Description of Survey Methodology:

The biologists conducted active and passive surveys within a survey buffer of 0.25 mile for white tailed kite, 500 feet for raptors, coastal California gnatcatcher, and least Bell's vireo, 250 feet for passerine birds in open space, and 150 feet for common passerines in residential, commercial and industrial areas. Active survey methods included walking meandering transects through the habitats while observing bird behavior with the aid of binoculars and directly searching in vegetation, trees, the ground, the towers/poles, and other potential nest substrates. Passive survey methods included stationary observation periods from select vantage points that provided maximum visibility of the survey areas, using binoculars as necessary. If potential nesting behavior was observed within the survey buffers, specific shrubs were directly searched for nests in the areas where birds may have been observed exhibiting higher levels of activity or potential breeding behavior. All potential raptor nesting areas within the survey buffers

were searched directly and/or with the aid of binoculars. Visibility, access, time of year and weather conditions was all conducive to collecting comprehensive breeding data, and ample time was spent surveying all potential nest sites.
